J O N A H.

Jonah.

JONAH, the fifth in order of the minor prophets. No era is assigned to him in the book of his prophecy, yet there is little doubt of his being the same person who is spoken of in 2 Kings xiv. 25, where he is described as the son of Amittai, and a native of Gath-hepher, in the tribe of Zebulun. He flourished in or before the reign of Jeroboam II., and predicted the successful conquests, enlarged territory, and brief prosperity of the Israelitish kingdom under that monarch's sway.

The Book of Jonah contains an account of the prophet's mission to denounce Nineveh, and of his refusal to undertake the embassy—of the method he employed to evade the unwelcome task, and the miraculous means which God used to curb his self-willed spirit, and subdue his petulant and querulous disposition. After narrating his fulfilment of the Divine command we are again presented with another exemplification of his refractory temper. His attempt to flee from the presence of the Lord must have sprung from a partial insanity, produced by the excitement of distracting motives in an irascible and melancholy heart. The mind of Jonah was dark and moody, not unlike a lake which mirrors in the waters the gloomy thunderclouds overshadowing it, and flashing over its sullen waves a momentary gleam.

The history of Jonah is certainly striking and extraordinary. Its characteristic prodigy does not resemble the other miraculous phenomena recorded in Scripture; yet we must believe in its literal occurrence, as the Bible affords no indication of being a mythus, allegory, or parable. Our Saviour's pointed and peculiar allusion to it is a presumption of its reality (Matt. xii. 40). The opinion of the earlier Jews (Tobit xiv. 4; Joseph. *Antiq.* ix. 10, 2) is also in favour of the literality of the adventure. It requires less faith to credit this simple excerpt from Jonah's biography, than to believe the numerous hypotheses that have been invented to deprive it of its supernatural character. Some, who cannot altogether reject the reality of the narrative, suppose it to have had a historical basis, though its present form be fanciful or mythical. Grimm regards it as a dream produced in that sleep which fell upon Jonah as he lay on the sides of the ship. The opinion of the famous Herman

von der Hardt, as given by Rosenmüller was, that the book is a historical allegory, descriptive of the fate of Manasseh, and Josiah his grandson, kings of Judah. Tarshish, according to him, represents the kingdom of Lydia; the ship, the Jewish republic, whose captain was Zadok the high-priest; while the casting of Jonah into the sea symbolized the temporary captivity of Manasseh in Babylon. Others regard this book as an allegory, such as Bertholdt and Rosenmüller, Gesenius, and Winer—an allegory based upon the Phœnician mythus of Hercules and the Sea-monster. Less supposed that all difficulty might be removed by imagining that Jonah, when thrown into the sea, was taken up by a ship having a large fish for a figure-head—a theory somewhat more pleasing than the rancid hypothesis of Anton, who fancied that the prophet took refuge in the interior of a dead whale, floating near the spot where he was cast over board. De Wette regards the story as not a true history, yet not a mere fiction; its material being derived from popular legends, and wrought up with the design of making a didactic work. But many regard it as a mere fiction with a moral design—the grotesque coinage of a Hebrew imagination. This opinion, variously modified, seems to be that of Semler, Michaelis, Herder, Stäudlin, Eichhorn, Augusti, Meyer, Pareau, and Maurer.

These hypotheses are all vague and baseless, and do not merit a special refutation. Endeavouring to free us from one difficulty they plunge us into others yet more intricate and perplexing. Much profane wit has been expended on the miraculous means of Jonah's deliverance, very unnecessarily and very absurdly. The species of marine animal is not defined, and the word is often used to specify, not the genus whale, but any large fish or sea-monster. There is little ground for the supposition of Bishop Jebb, that the asylum of Jonah was not in the stomach of a whale, but in a cavity of its throat, which, according to naturalists, is a very capacious receptacle, sufficiently large, as Captain Scoresby asserts, to contain a merchant ship's jolly-boat full of men. Since the days of Bochart it has been a common opinion that the fish was of the shark species, *Lamia carnis carcharias*, or "sea-dog" (Bochart, *Op.* iii. 72; Calmet's

Jonah.

Jones,
Inigo,

Dissertation sur Jon.) Entire human bodies have been found in some fishes of this kind. The stomach, too, has no influence on any living substance admitted into it.

The Book of Jonah is a simple narrative, with the exception of the prayer or thanksgiving in chap. ii. Its style and mode of narration are uniform. There are no traces of compilation, as Nactigall supposed; neither is the prayer, as De Wette imagines, improperly borrowed from some other sources. That prayer contains, indeed, not only imagery peculiar to itself, but also such imagery as at once was suggested to the mind of a pious Hebrew preserved in circumstances of extreme jeopardy. There was little reason either for dating the composition of this book later than the age of Jonah, or for supposing it the production of another than the prophet himself. The Chaldæisms, which Jahn and others find, may be accounted for by the nearness of the canton of Zebuion, to which Jonah belonged, to the northern territory, whence by national intercourse Aramaic peculiarities might be insensibly borrowed. Gesenius and Bertholdt place it before the exile; Jahn and Koester after it. Rosenmüller supposes the author may have been a contemporary of Jeremiah; Hitzig postpones it to the period of the Maccabees. Apocryphal prophecies ascribed to Jonah may be found in the pseudo-Epiphanius (*De Vitis Proph.* c. 16), and the *Chronicon Paschale*, p. 149. Various spots have been pointed out as the place of his sepulchre, such as Mosul in the East, and Gath-hepher in Palestine; while the so-called Epiphanius speaks of his retreating to Tyre and being buried there in the tomb of Cenezæus, judge of Israel.

Among the numerous commentators on Jonah may be noticed J. Gerhard, *Annot. in Proph. Am. et Jon.*, &c., Frag. 1692; Lessing, *Observat. in Vatic. Jon.* 1782; Grimm, *Der Proph. Jionas af. Neue Uebersetz.* 1798; Forbiger, *Prohusio*, &c., 1827; Krahmer, *Das B. Jon. Hist. Krit. untersucht*, Cassel, 1839.

JONES, INIGO, a celebrated architect, often but absurdly called "the English Palladio" was born in London in 1572. His father was a respectable cloth-worker in the neighbourhood of St Paul's. Little is known of Jones' early years. According to some accounts he was apprenticed to a joiner; according to others, he received a liberal education. This much is certain, however, that while still very young he exhibited a great turn for drawing. Some of his designs fell into the hands of William, Earl of Pembroke, who was so much pleased with them that he supplied the draughtsman with the means of prosecuting his art-studies abroad for three or four years. Thus provided, Jones travelled through France, Germany, and Italy, carefully examining the best specimens of ancient and modern architecture, and taking measurements and drawings of such as struck his fancy. His progress was of course slow, as every important building, or at least every style had to be studied separately. He had left home without any training for the art-world that now began to open up before him. The Grecian orders had been forgotten in England, if indeed they had ever been known there; and the Italian orders had never been introduced, except in fragmentary details. This though a misfortune for England was an advantage to Jones. The popular Tudor style had begun to fall into disrepute from the many corruptions that had crept into it, and no other had arisen to take its place. To the fact that Jones now stepped in and supplied a long-felt want he owed the fame which he enjoyed in his own life-time, as well as in succeeding ages, and his nick-name (for it is nothing more) of "the English Palladio." In 1604, on the invitation of Christian IV., Jones migrated from Italy to Denmark, and is said to have there furnished the plans for the two royal palaces of Rosenborg and Fredericksborg. These edifices are both still extant, and if they really are due to their reputed architect, merely confirm the idea of his mediocrity. Their

authenticity, however, is more than suspicious. In the following year Christian used his interest on Jones' behalf with his brother-in-law, James I. of England; and Jones on returning to his native country was kindly received at court. Besides being appointed architect to the Queen and Prince Henry, he was entrusted with the conduct of the masques, then a favourite court amusement. From the time, thought, and money, expended on these displays, they seem to have been little inferior in splendour to those magnificent fêtes afterwards given at Versailles by Louis XIV. Ben Jonson supplied the poetry; Jones the designs and decorations; skilful composers the music; while the royal family and the flower of the young nobles danced in the interludes. The best part of Jones' time was squandered on these shows, and accordingly none of his greater works can be referred to this period of his life. In 1612 he paid a second visit to Italy, and there learned the defects of the bastard style of mingled Greek and Gothic which his half-educated taste had led him too often to adopt. On his return home he was made surveyor-general of the royal buildings, and began to draw the designs for a new palace at Whitehall. The plans of the whole work, which is undoubtedly Jones' *chef d'œuvre* have been published along with many other of his drawings; but the only part of the proposed palace that was ever built is the Banqueting House. While the building was still in progress, Jones was commissioned by his royal patron to examine and report upon Stonehenge. He set about this task with a zeal far beyond its importance, and came to the startling conclusion that these vast and shapeless masses of stone were the ruins of a Roman temple. Posterity has only to regret that so much time and ingenuity should have been thrown away on such a solution of the mystery. Jones' next work was the restoration of old St Paul's. He renewed the sides with very bad Gothic, and completed his blunder with a splendid Corinthian portico. Both were much admired in their day, as were also his designs for the river-front of Somerset House. Not less bepraised were the arcade and church of St Paul, Covent Garden—"two structures," says Walpole, "of which I want taste to see the beauties. In the arcade there is nothing remarkable; the pilasters are as arrant and homely stripes as any plasterer could make. The barn-roof over the portico of the church strikes my eyes with as little idea of dignity and beauty as it would do if it covered nothing but a barn." With reference to the church Quatremère de Quincey, an upholder of Jones declares that the most memorable thing about it is the repute in which it is held. Surgeons' Hall, Lindsay House, Shaftesbury House, and many others both in London and the provinces, attest at once the fertility of their designer's pencil and the uncultivated taste of his employers. Scotland only boasts of two buildings in which Jones is said to have had a hand; these are, Heriot's Hospital in Edinburgh, and Glamis Castle in Forfarshire. His claims to the first are now held to be apocryphal; and such repairs as he executed on the second, add little to his credit.

When the civil war broke out Jones clung faithfully to his royal master and his party. Besides being a courtier, he was also a Roman Catholic, and therefore doubly hateful to the victorious Parliamentarians. The heavy fines which he was forced to pay failed to shake his loyalty or his faith, and he died, heart-broken and poor, July 21, 1651, in his seventieth year. Many of his designs were published at intervals after his death by Kent, Colin Campbell, and Isaac Ware; and his *Notes on Palladio* were published in an edition of that architect's works in 1714.

JONES, John Paul, was born in 1747, at Arbigland, in the parish of Kirkbean and stewartry of Kirkcudbright. He was a natural son of Craig of Arbigland; but his reputed father was John Paul, a gardener in that gentleman's service. The agnomen of Jones was assumed by himself

Jones,
William.

at the outset of what may be called his public career. At the age of twelve he went to sea, and traded for some years to America. In the course of these voyages he made himself so thorough a master of seamanship and navigation, that, according to a local account, "he was allowed to be unmatched on that coast (the west coast of Scotland) for skill in sea matters." For some time he was engaged in the slave-trade, from which, however, after a few voyages, he retired in disgust. On his way back to England the captain and mate of the vessel in which he was, both died. At the request of those on board, Jones took the command, and brought the vessel safe into port. For this service, the owners made him captain of the ship, and in a few years he realized a handsome fortune. In 1773 he settled in Virginia on a property which had fallen to him on the death of his elder brother, a planter and merchant in that state. When the war of the American Independence broke out, he offered his sword to the revolted colonies, was made captain of a small ship of war, and in six weeks had made no fewer than sixteen prizes. In 1777 he set out for France, and was appointed to the "Ranger," with which he made a descent on the north coast of England, seized the fort of Whitehaven, burnt some of the shipping, and for some weeks kept the adjoining shores of England and Scotland in constant alarm with his single ship. Two years later he set sail on a similar expedition to the east coast, reached the Firth of Forth, and very nearly executed his threat of burning every ship in the harbour of Leith. A strong wind drove him out to sea, and saved the town. Altering his tack, he turned his prow southwards, and off Flamborough Head fell in with the homeward-bound British fleet from the Baltic, convoyed by two powerful men-of-war. After a desperate and bloody battle, one of these struck its flag to Jones' own ship, which was itself so much shattered in the action, that it went to the bottom next day. This victory raised his fame to its acme; and on his arrival in Paris he was presented by Louis XVI. with a splendid sword, enhanced in value by a very flattering inscription. For a while he reigned as the lion of the day in Paris, followed the fashions, and desired to be thought a man of *ton*. An Englishman then resident in the French capital described him as "a smart little man of thirty-six; speaks but little French, and appears to be an extraordinary genius; a poet as well as a hero." A contemporary Scottish account describes him as a "short, thick, little fellow, about 5 feet 8 inches in height, of a dark swarthy complexion." Jones, it seems, had already wrought hard to supply the defects of a neglected education, and talks in his letters of the "midnight studies" in which he was then engaged. On his return to America, Congress voted him a splendid gold medal, and passed a resolution commending his "zeal, prudence, and intrepidity." When peace was concluded, Jones returned to France as American agent for prize-money. A few years later he entered the Russian service with the title of rear-admiral, and was in the fair way of rising still higher when the jealousies and petty intrigues of his brother officers induced him to quit it altogether. It was in vain that Catharine tried to retain him by temptations of no ordinary value. He returned once more to Paris, where the great events of the Revolution prevented him from getting a hearing for his claims. The last days of his life were spent in poverty and neglect, embittered by lingering and painful diseases. An attack of dropsy finally carried him off, July 18, 1792.

JONES, William, an eminent divine of the Church of England, was born at Lowick, in Northamptonshire, in 1726. He received his education at the Charter-House and University College, Oxford. He became in succession vicar of Bethersden, Kent, in 1764; rector of Pluckley, perpetual curate of Nayland, Suffolk, and rector of Hollingbourne, Kent, in 1798. He took up his residence at Nayland, in 1776, and remained there till his death, in 1800. He was

an intimate friend of Bishop Horne, with whom he was associated in the defence of John Hutchinson's philosophical and theological tenets, and whose biography he wrote in 1795.

Although best known for his book on the Trinity, Jones employed his pen with considerable felicity on political and other subjects. Bishop Horsley eulogizes him for his "quick penetration, extensive learning, and sound piety, and for the talent he had of writing upon the deepest subjects to the plainest understandings."

His works were published, in 12 vols. 8vo, in 1801. The theological and miscellaneous works were republished in 6 vols. 8vo, in 1810. In addition, two posthumous volumes of sermons were published in 1830. The principal treatises are—*The Catholic Doctrine of the Trinity proved from Scripture*; *A full Answer to Bishop Clayton's Essay on Spirit*; *Remarks on the Confessional*; *Zoologia Ethica*; *A Course of Lectures on the Figurative Language of Scripture*; *An Essay on the Church*; *An Essay on the First Principles of Natural Philosophy*, and a number of political tracts written after the commencement of the French Revolution. Prefixed to the first volume is a life of the author (by William Stevens). Jones of Nayland was the originator of the *British Britic*.

JONES, Sir William, an illustrious Orientalist, lawyer, and general scholar, was born in London, September 28, 1746. He was the son of William Jones, a man of some note in his day, and the author of several treatises on the higher mathematics. This parent died when his son was only three years old; and the care of the child's upbringing devolved upon his mother, a woman of strong sense and considerable accomplishments. At the age of seven, young Jones was sent to Harrow, and remained at that school for ten years. Though his studies were on one occasion interrupted for a twelvemonth, he easily and far outstripped all the lads of his standing. The head master himself was so strongly impressed with the idea of his favourite pupil's intellectual force, that he often said that "if Jones were left naked and friendless on Salisbury Plain, he would nevertheless find the road to fame and riches." Another head master was heard to assert that Jones knew more Greek, and was a greater proficient in the idiom of that language than himself. During the latter years of his attendance at Harrow he began to dip into matters beyond the classic routine of the school. He mastered the Arabic alphabet, and made sufficient progress in Hebrew to be able to read the language with some ease. During his vacations he addressed himself to French and Italian. To perfect himself in most of these tongues he spent much time in composing in them. In 1764, being then in his eighteenth year, he went to Oxford, where, at University College, he continued to study as diligently and successfully as ever. The Eastern languages continued to engage his thoughts, and a native of Aleppo, whom he discovered in London, rendered him effective aid in his researches. After graduation he joined the family of Earl Spencer, as tutor to Lord Althorp, and resided with that nobleman for five years. A fellowship conferred upon him at this time placed him beyond the fear of want, and enabled him to prosecute his studies without distraction. His fame now began to spread as one of the first orientalists of his age. In 1768, while still with Earl Spencer, he had been requested by Christian VII. of Denmark to translate into French a Persian *Life of Nadir Shah*. The work appeared in 1770, and its value was enhanced by the treatise on Eastern Poetry, and the translations from the *Odes of Hafiz* (both written in French), which accompanied it. His *Persian Grammar*, published in the following year, is still the standard text-book on that subject. Having long contemplated with pleasure "the stately edifice of the laws of England," Jones now resolved to study for the bar. He had hardly begun when he found himself called upon to defend his university from the mean

Jones, Sir
William.

Jones, Sir
William.

and unjust aspersions of the French orientalist, Anquetil du Perron, in his introduction to the *Zend-avesta*. The defence was written in the same language as the attack; and the French themselves have never denied that in the learning, as well as the bitterness of the controversy, their countryman was left far behind. Jones' pamphlet was anonymous; and its French was so racy and idiomatic that many foreign savans not acquainted with the details of the quarrel attributed it to some *bel esprit* of the French capital. In the following year he published a small volume of poems, chiefly translations from various eastern tongues. This work was a sort of harbinger of a far greater and more important one, which he gave to the world in 1774, under the title of *Poeseos Asiaticæ Commentariorum Libri Sex*. His design was to familiarize the European mind with the oriental modes of thought and styles, and the specimens of translation from the Hebrew, Arabic, Turkish, and Persian, show that, with this kind of learning, rare even among the most erudite men, the writer combined a taste rare even among *littérateurs*. He extracted so skilfully, and translated so adroitly, that the Eastern writers quoted by him acquired under his pen a charm and purity which one looks for in vain in their own works. Called to the bar in this same year, Jones devoted himself for a time exclusively to legal studies. A patriotic feeling was mingled with this resolve. "Had I lived at Rome or Athens," he said, "I should have preferred the labours, studies, and dangers of their orators and illustrious citizens, connected as they were with banishment and even death, to the groves of the poets or the gardens of the philosophers. Here I adopt the same resolution. The constitution of England is in no respect inferior to that of Rome or Athens." Carrying out this design, he tried to obtain a seat in parliament. But his politics were too liberal and too hostile to the government of the day. He was known to have expressed cordial sympathy with the American colonies in their revolt and War of Independence. He was strongly opposed to the slave-trade, and no less strong in favour of electoral and parliamentary reform.

It was no wonder then, that, when he stood for Oxford in 1780, he found his chances of success so small that he withdrew from the contest. His political views and leanings he had made known at various times in a fragmentary manner in his *Principles of Government*; *Plan of a National Defence*; *Enquiry into the Legal Mode of Suppressing Riots*; and other short essays, reprinted in the collective edition of his works. But though he was always writing and speaking in favour of liberty and free government, he was no party man, and was desirous, he said, of being transported 5000 leagues from all the fatal discord of contending politicians. His wishes were soon gratified. Through the influence of Lord Ashburton he was appointed, in 1783, a judge in the supreme court of judicature at Fort William in Bengal. On this occasion he was knighted, and a few weeks after these two-fold honours he married Miss Shipley, the eldest daughter of the Bishop of St Asaph. Not long before he set sail for India he had resumed his Oriental studies, and in 1782 had published an English version of the seven old Arabic poems known as the *Moallacah* or *Suspended*, so called from having hung on the walls of the great temple of Mecca, ever since the death of the prophet. On arriving in India he entered upon his judicial duties with all the advantages of a high reputation, unsullied integrity, disinterested benevolence, and unwearied perseverance. One of his first acts on landing, was to seek out such persons within his reach as had pursued a line of research similar to his own. These he formed into a society for inquiring into the history and antiquities, the arts, sciences, and literature of Asia. He was chosen the first president of this learned body, and after an interval of four years, that is to say, in 1788, saw through the press the first volume of its *Memoirs*. To these *Asiatic Researches*

Jones, Sir
William.

European scholars owe a very large share of their knowledge of the religion, antiquities, and history of the Hindus. The papers contributed by the president himself on these and kindred subjects were of immense value. Sir William's next care was to master Sanscrit, the law language of the country. Till his time the British judges had not seen fit to take this precaution; and thus important powers were vested in the pundits, who dealt out Hindu law as they pleased. To ensure the better administration of justice Sir William next offered to government to make a complete digest of Hindu and Mohammedan law, and to translate it when made. Government closed with the offer, and Jones began the work; which, however, he did not live long enough to finish. It devolved on Mr H. T. Colebrooke to carry out the imperfect design; and the *Digest of Hindoo Laws* was issued under his superintendence at Calcutta in 1800. This compilation was based on the famous ordinances of Menou or Manu, a very ancient Indian legislator. The ordinances themselves, containing a complete system of civil and religious duty, were translated by Sir William in 1794. Not the least valuable service which he rendered to Hindu literature, was his English version of the *Sucontala*, or *The Fatal Ring*, a dramatic poem of Kālidāsa. Nor should we overlook his translation of the *Hitopadesa*, the mine from which the celebrated fables of Pilpay are believed to have been taken. These literary occupations, severe and engrossing as they were, were only the "parerga" of Sir William's life. His primary duties were judicial; and he performed these with a laborious and conscientious exactitude beyond all praise. As his biographer remarks, "the inflexible integrity with which he discharged the solemn duty of his station will long be remembered in Calcutta, both by Europeans and natives." His unremitting labours at last undermined his health, and he was preparing to return to England, when a sudden illness, neglected at first, carried him off. He died at Calcutta, April 27, 1794, in the forty-eighth year of his age.

In the course of his comparatively short life Sir William Jones condensed an amount of hard and honest labour that seems scarcely compatible with the limited faculties of the human mind. His powers, however, were those of an acquirer and exponent rather than of an original thinker. Every thing that came before him to be learned he mastered with equal ease. Selecting languages as his special sphere, he mastered Greek and Latin, while Italian, French, Spanish, Portuguese, and German were almost as familiar to him as his mother-tongue. Of the Eastern dialects those in which he was most at home were Sanscrit, Arabic, and Persian. It may be doubted, indeed, if there ever was any European so deeply learned in the literatures of these tongues as he. Hebrew, Turkish, and even Chinese likewise fell within his range; while there were many other languages of which he had a great, though less thorough knowledge. Of his contemporaries Mezzofanti alone was his superior as a linguist; but in general force of mind, and in the power of making his knowledge available, either to himself or others, the Englishman was vastly superior to the Italian. His range was also infinitely wider. Had he devoted to the sciences the time and labour he bestowed on the languages, he would have attained equal eminence in them. As it was, he had a wide acquaintance with mathematics and chemistry; and in his latter years botany became a favourite study. "He seems to have acted," says his biographer, "on this maxim, that whatever had been attained was attainable by him; and he was never observed to overlook or neglect any opportunity of adding to his accomplishments, or to his knowledge. When in India his studies began with the dawn, and, in seasons of intermission from professional duty, to have been continued throughout the day. Meditation retraced and confirmed what reading had collected or investigation discovered."

Jonkoping He was very careful in his distribution of his time. Sir
Edward Coke had written—

"Six hours in sleep, in laws grave study six,
Four spend in prayer, the rest on nature fix."

Jones altered the distich thus:—

"Seven hours to law, to soothing slumber seven,
Ten to the world allot, and all to heaven."

It is much to be regretted that Jones did not concentrate his powers. Much as he certainly did make out of his vast attainments, he might have made far more, had he chosen, instead of continually increasing his stores, to think out and reason upon those already amassed. His intellectual force became weakened by diffusion over too great a variety of objects. His weakness manifests itself in his judgments of men and questions, as well as in his style, which is often languid and heavy. His numerous contributions to the *Asiatic Researches*, valuable and instructive as they are, owe more of their interest to their subject-matter than to their setting; and the same may be said of nearly all his writings that bear upon the East. Nor can it be fairly said that as a poet he has any claim to original genius. His verse is often lofty and sonorous, and is not without a certain nobility of thought. Sometimes it even glows with the semblance of passion. Even his best pieces, however, are not much more than showy rhetoric or brilliant imitation. But with all these deductions there remains a great deal in the writings of Jones that is worthy of our admiration. The man can never be estimated too highly. As a judge, as a scholar, as a citizen, and as a friend, there is hardly any Englishman of whom his country has greater reason to be proud.

In addition to the works already mentioned, Jones translated the speeches of Isæus on the Right of Inheritance at Athens, and two Mohammedan essays on the same subject, some of the *Tales and Fables* of Nizami, and considerable portions of the *Vedas*. There have been two complete editions of Jones' works, one in 6 vols. 4to, 1799, and the other in 13 vols. 8vo, 1807. To the latter of these was appended a life of the author by Lord Teignmouth, to which we are chiefly indebted for the facts of the foregoing narrative.

JONKOPING, a laen in the southern part of Sweden, bounded on the N. by Mariestad, Lake Wetter, and Linköping, E. by Kalmar, S. by Wexio, and W. by Halmstad and Wenersberg. Area 4275 square miles. A great part of the surface is rocky and mountainous, but other parts are of considerable fertility, producing grain sufficient for the wants of the people, as well as potatoes, hemp, flax, and buckwheat. It is rich in minerals, particularly iron, which is worked to a considerable extent. The woods are extensive and furnish deals, pitch, tar, and potash for exportation; cattle, butter, and cheese, are also among its exports. Pop. (1850) 163,426.

JONKOPING, the capital of the above laen, is situated at the southern extremity of Lake Wetter, 80 miles E. of Gottenborg. It is generally well built, with wide and regular streets; and has a handsome church, a guildhall, arsenal, theatre, and grammar school. Chief manufactures, woollen and linen goods, leather, and tobacco. Pop. 4742.

JONSON, BEN, an eminent English dramatist, the contemporary and friend of Shakspeare, was born at Westminster in 1573. His family was originally of the south of Scotland, no doubt cadets of the old border clan of Johnstone, of which the Lairds of Lochwood, ancestors of the Marquisses of Annandale, were the chiefs. His grandfather had migrated from Annandale to Carlisle, and afterwards entered into the service of Henry VIII. His father suffered confiscation and imprisonment under Queen Mary for his adherence to the Protestant faith; but living into the happy reign of Elizabeth, he became a preacher and

survived till 1573. Benjamin, or Ben (his own familiar abbreviation) was a posthumous son, born about a month after his father's decease. His mother's name has not transpired, but from an incident related by her son, she must have been a remarkable person, with more of the spirit of a Roman matron than that of an Englishwoman who had been a minister's wife. In 1604, Jonson, according to his own narration to Drummond of Hawthornden, was accused of writing, in conjunction with Chapman and Marston, against the Scottish nation, in a play named *Eastward Hoe*. Sir James Murray had laid a complaint on the subject before the king; and the report was that the offending dramatists would have their ears and noses cut. The charge was abandoned; and Jonson in congratulation of his escape, banquetted all his friends. Camden, Selden, and others were present, and "at the midst of the feast," he says "his old mother drank to him, and showed him a paper which she had (if the sentence had taken execution) to have mixed in the prison among his drink, which was full of lusty strong poison, and that she was no churl, she told, she minded first to have drunk of it herself." This high-spirited dame is said to have married again shortly after the death of Jonson's father, her second husband being a bricklayer, living in Hartshorn Lane (now Northumberland Street) Charing Cross. Fuller, who mentions this fact, does not give the second husband's name, but Malone and Gifford, finding that a Mrs Margaret Jonson was married in 1575 at St Martin's-in-the Fields (where Ben Jonson, when a child, is known to have attended school), to a man named Thomas Fowler, concluded that this was the marriage of Jonson's mother. Recent researches, however, prove that the Mrs Fowler married in 1575 was dead before 1595, whereas, Jonson's mother was living, as we have seen, in 1604. We have consequently yet to ascertain the name of Jonson's stepfather, if such a relationship really existed. All that he tells us himself is that he was brought up poorly, sent to school by a friend, and afterwards put to a craft which he could not endure. The school in which he was placed by the generous unnamed friend, was the famous Westminster School, then taught by Camden, the learned antiquary and historian, to whom Jonson has expressed his gratitude both in prose and verse. The disagreeable occupation to which he was removed was that of a bricklayer; and Fuller states that Ben assisted in building part of Lincoln's Inn, having a trowel in his hand and a book in his pocket. The trowel was soon thrown aside; Ben enlisted in the army and served during one or two campaigns in the Low Countries. In his epigram *To True Soldiers* he boasts that he did not shame the great profession of arms; and on one occasion, in the face of both camps, he killed an enemy and took *opima spolia* from him. On his return to England, he "betook himself," he says, "to his wonted studies." He is said to have entered himself of St John's College, Cambridge, but there is no evidence of his academical career, and the statement may have arisen from the fact that in advanced life, as a compliment to his scholarship and dramatic genius, he was created Master of Arts in both universities. In his lines addressed to Camden he emphatically says:—

"Camden, most reverend head! to whom I owe
All that I am in arts—all that I know."

Jonson was not the man to have concealed his university education had he received that distinction. Before he was twenty years of age he was married, and earning a precarious subsistence by acting at the Curtain Theatre in Shoreditch, and writing for the stage. At this time London and its suburbs swarmed with low theatres, and the licentious character of the performances led the privy council to issue orders for their suppression. The players, supported by the populace, kept up a constant war with the

Jonson,
Ben.

Jonson. civic rulers, but Jonson fortunately obtained a better field for the display of his dramatic talents. As an actor he seems to have failed. He was of too rugged and unbending a nature for that plastic profession, and his person would seem to have been unsuitable, as he mentions his "mountain belly and rocky face," the results perhaps of his subsequent deep potations of Canary. In 1598 his comedy of *Every Man in his Humour* was performed by the Lord Chamberlain's servants at the Globe Theatre. Shakspeare was one of the original performers, and, according to a tradition mentioned by Rowe, it was in consequence of his friendly recommendation that the play was accepted and brought on the stage. The peculiar merits of this comedy and the leading characteristics of Jonson's dramatic genius, have already been described by one to whom universal homage is due (see the article *DRAMA*), and we need only remark that before the appearance of this first play of Jonson's, English comedy can scarcely be said to have existed. Shakspeare drew none of his scenes from the domestic life and manners of his countrymen, and the delineations of Nash, Greene, and other contemporary dramatic writers, were either gross caricatures or lifeless inanities. Jonson gave the true form and pressure of English society, in which individual character was developed and a succession of natural and probable incidents represented. "He had learned the principles of comedy," says Mr Hallam, "from Plautus and Terence;" true, but his adaptation of those principles to English characters and manners was the happy conception of genius wrought out with consummate skill and judgment. Jonson never improved upon his first work. His *Bobadil* and *Kitely* are his most successful inventions in the way of comic portraiture; and though his later comedies,—*The Alchemist*, *Volpone*, or *The Fox*, and *The Silent Woman*,—display greater affluence of dramatic powers and language, and a wider range of character and incident, they depart wholly from the simplicity of nature, and are disfigured by pedantic and over-laboured description.

The brilliant commencement of Jonson's career as an author was clouded by an event which threw him into prison, and almost brought him, as he said, to the gallows. He quarrelled with a brother actor named Gabriel Spencer; a duel ensued, and Jonson killed his antagonist, though the latter, as he stated, was provided with a sword 10 inches longer than his own. Henslowe, a theatrical manager, writing to his son-in-law, Edward Alleyn (the successful tragedian and founder of Dulwich College), on the 26th of September 1598, thus quaintly describes the unfortunate accident:—"Since you were with me I have lost one of my company, which hurteth me greatly,—that is Gabriel; for he is slain in Hoxton Fields by the hands of Benjamin Jonson, bricklayer." This allusion to Jonson's former employment was no doubt made in contempt of the successful duellist, who was an inferior actor to Spencer. In prison Jonson was visited by a Roman Catholic priest, who converted him to the Romish Church, and he remained in that communion twelve years. His literary studies seem not to have been interrupted by his incarceration, which probably did not last long. In 1599 he produced his *Every Man Out of his Humour*, a comedy which attracted Queen Elizabeth to the theatre; and in 1600 and 1601 two other plays proceeded from his ready pen—*Cynthia's Revels*, and *The Poetaster*. In the latter he satirised his contemporaries, Decker and Marston; and Decker retaliated by a counter-satire, *The Satiromastix*, or *the Untrussing of a Humorous Poet*. The angry dramatists were, however, soon reconciled; and, on the accession of James I., when Jonson was desired by the court and the city to prepare a masque or pageant for the reception of the king, he selected Decker as his associate in the task. Previous to this (1603) Jonson's tragedy of *Sejanus* was brought out at the Globe

Theatre, and Shakspeare is again mentioned as one of the performers (the last time that his name occurs as an actor). Jonson's tragedy was ill received by the audience. He had copied largely from Tacitus, to evince his "integrity to the story," as he relates, and to save himself from those "common torturers" who criticised his plots, and whom he compares to swine rooting up the muses' gardens. The torturers, however, were not propitiated by this sacrifice to historic truth, for *Sejanus* suffered nearly as much violence from the London audience as its subject did from the rage of the people of Rome. Some one had assisted Jonson in the composition of the tragedy; he threw out the contributions of this unknown "second hand," and the play being remodelled, was brought out with success. It is a heavy but grand and imposing classic drama.

The reign of James was eminently propitious to the stage. A few days after his arrival in London the king took the Lord Chamberlain's players into his pay and patronage; the queen adopted the Earl of Worcester's company; and Prince Henry that of the Lord Admiral. The new sovereign, as appears from Mr Peter Cunningham's *Extracts from the Accounts of the Revels at Court* (Shakspeare Society, 1842), saw five times as many plays in a year as Queen Elizabeth was accustomed to witness. Jonson, though unfortunate in his play of *Eastward Hoe*, atoned for the imagined insult to royalty and Scotland by assiduous and successful court to James, and participated liberally in his majesty's bounty and favour. Between the years 1605 and 1618 he appears to have been incessantly employed either in the production of what may be termed legitimate dramas, or in the preparation of masques for the court and principal nobility, in which his classic impersonations and fine lyrics were aided by music and machinery, and by the effects of splendid dresses and decorations. In these courtly entertainments Jonson was assisted by the inventive and artistic skill of Inigo Jones. During the period we have mentioned Jonson produced his *Volpone*, or *The Fox* (1605); the *Silent Woman* (1609); *Catiline*, a classic tragedy resembling his *Sejanus* (1611); *Bartholomew Fair* (1614); *The Devil is an Ass* (1616); and his masques of *Blackness*, of *Queens*, of *Beauty*, *Oberon*, *Christmas*, &c. Of Jonson's remuneration from these gorgeous masques, we have no account. The cost of *Oberon*, or *Prince Henry's Masque*, is given in the *Court Revels*, and it appears to have amounted to no less than L.1412, 6s. 10d. The mercers and silkeners have the principal share; and, while only L.16 were awarded to Inigo Jones as "deviser," the tailors' bill was L.142, 13s. 6d. As long as King James lived Jonson produced a masque every year on *Twelfth Night*, and received a pension of 100 merks. He was now at the height of his popularity as a dramatist, though experiencing frequent reverses as to public favour and the reception given to his plays, all of which he affected to despise and condemn. He bore himself loftily to the world, but had gathered round him a knot of young admirers, of whom he was the assumed poetical father, and who were said to be "sealed of the tribe of Ben." The scene of their festivities was a great room, "The Apollo," in the Devil Tavern, near Temple Bar; and the *Leges Conviviales*, or rules of the club, were drawn up by Jonson in Latin, and painted in gold letters on a board over the chimney-piece. (This curious relic is still preserved in the Messrs Child's banking-house.) Jonson was also a frequenter of the Mermaid Tavern in Friday Street, where he had higher intellects to contend with, as Shakspeare, Beaumont, and Fletcher, Selden, Carew, Donne, Raleigh, &c. The joyous meetings of the Elizabethan wits have been immortalized by Beaumont in the well-known lines addressed to Jonson, commencing—

"What things have we seen
Done at the Mermaid! heard words that have been
So nimble and so full of subtle flame," &c.

Jonson. Viewing in fancy these "wit contests," Fuller compared Jonson to a Spanish great galleon, and Shakspeare to an English man-of-war. "Master Jonson, like the former, was built far higher in learning; solid but slow in his performances. Shakspeare, like the latter, lesser in bulk, but lighter in sailing, could turn with all tides, and take advantage of all winds, by the quickness of his wit and invention." Who but must regret that the Mermaid had not a Boswell to give these scenes a life through all ages?

In 1613 Ben Jonson visited France in the capacity of governor to Sir Walter Raleigh's son. This was an office for which the dramatist's habits peculiarly unfitted him; and he related himself that the "knavish youth" on one occasion caused him to be drunken, laid him on a car, and had him drawn by pioneers through the streets, at every corner showing his governor stretched out! While in Paris he was introduced to Cardinal du Perron, who showed him his translations of Virgil, on which Ben pronounced the commendous criticism that "they were naught." In 1618 he undertook a more memorable journey to Scotland, resolving to walk all the way both going and returning; which feat,—remarkable in a man forty-five years of age, and of bulky frame,—he successfully accomplished. He spent some months in Edinburgh and Leith, and towards the close of the year went on a visit to Drummond of Hawthornden. In the course of conversation, Jonson, over his cups, was characteristically free in his strictures on his contemporary poets, and in relations of his own adventures and opinions. Drummond took notes of the table-talk of his distinguished guest, for which he has been accused of treachery, "discrediting the name of poet," says Mr Procter (Barry Cornwall), "and tarnishing the hospitality of his hospitable country." Gifford had before branded the Scottish poet with "malignity," and Sir Walter Scott had undertaken his defence. A complete copy of these *Notes* was published in 1842, edited by Mr David Laing; and, so far from condemning Drummond, we are disposed, with Mr Hallam, to thank him for so much literary anecdote, only regretting that his industry had not been equal to his curiosity and fidelity, and that he had not accompanied Jonson's revelations with explanatory circumstances. Drummond never published the *Notes*, though he survived his visitor a period of twelve years; and this fact should of itself relieve his memory from the charge of being a traitor to his friend and guest. In these private memoranda Jonson does not appear to advantage. He was vain, boastful, and censorious; and these defects, exaggerated by the influence of wine, concealed the nobler qualities which appear in his poetry and animated his conduct. To Shakspeare, whom he has been accused of envying and maligning, he has devoted the highest and most discriminating tribute of love and admiration. Jonson intended to have described his journey to Scotland, and written a "fisher play" on Loch Lomond. He had collected materials from Drummond and others, but his manuscripts were destroyed by a fire in his house, on occasion of which he poured forth hearty execrations on Vulcan. His spirit was indomitable; never was a more laborious literary workman, despite his convivialities, but he seems to have been deterred from resuming his Scottish task, so unfortunately interrupted.

Evil days came with advance of years. In 1628 Jonson was struck with palsy, and he seems to have been at first neglected by the new sovereign, Charles I. He alluded to his necessities and sufferings in the epilogue to his play, *The New Sum*. The audience ungenerously hissed the play, but the king sent the dramatist a present of L.100. Thus encouraged, Jonson ventured to solicit, as a compensation for the unjust censures and bad taste of the age, that his yearly pension of 100 merks should be raised to pounds, and Charles granted the petition. He added also what was perhaps not less welcome, a tierce of Jonson's favourite

Canary wine, which was continued yearly during his life, and descended to his successors, the poets-laureate. The annual stipend and tierce of Canary, with the produce of plays and masques, should have secured comfort to the poet's declining years; but Ben was an improvident and bountiful liver. In December 1631 he is found petitioning his generous patron, the Earl of Newcastle, for such bounty as he could spare, "in the name of good letters;" and he enforced his claim by stating that "the barbarous court of aldermen had withdrawn his chandlery pension of L.33, 6s. 8d." Disease had not prostrated his intellect; in 1632 and 1633 he produced two comedies and two masques, which, though ranked by Dryden among Jonson's *dotages*, are not inferior to some of his early productions. His last work was an unfinished pastoral drama, *The Sad Shepherd*; a beautiful and highly poetical pastoral, the precursor and prototype of Fletcher's *Faithful Shepherdess* and Milton's *Comus*. Thus, in every department of poetry except the epic, Jonson challenged and won success, if not from his contemporaries, at least from posterity. His irrepressible pedantry and overcharged "humours," with the grossness which was the vice of his age, repel ordinary readers from his plays, and have banished them from the stage; but his masculine sense, wit, observation, and fancy (the last abounding in his exquisite lyrics and minor poems), constitute his right to be considered a great original master in our literature, and as second only to Shakspeare. He died August 6, 1637, and was buried in Westminster Abbey. A pavement stone marked the spot, inscribed "O RARE BEN JONSON;" which was done, says Aubrey, "at the charge of Jack Young (afterwards knighted), who, walking there when the grave was covering, gave the fellow eighteen pence to cut it." This stone has since been replaced by an uninteresting square, the work of some dull son of earth, a lover of uniformity; but the brief and pregnant inscription can never be forgotten, and supersedes any more elaborate epitaph. (R. C.—S.)

JOORIA, a populous and thriving sea-port of Hindustan, in the Gujerat peninsula, belonging to the rajah of Amram. It is situated on the Gulf of Cutch, twenty miles below Wowamia, and carries on a considerable traffic with Mandavee, and others places in the Gulf of Cutch, and on the western coasts of India, Persia, and Arabia, and occasionally with Bombay. Its exports consist chiefly of cotton, ghee, oil, and hides, to the southward, and coarse cloth for Persia and Arabia. In return it receives spices of all sorts, powder, lead, and cocoa-nuts. In 1808, the rajah and principal inhabitants agreed with the Bombay government not to permit or connive at piracy, and also to abstain from plundering persons in distress. E. Long. 70. 22., N. Lat. 22. 40.

JOPPA. See JAFFA.

JORDAENS, JACOB, a celebrated Flemish painter, was born at Antwerp in 1594. He studied under Adam van Oort, but his real master in the art of painting was his fellow-student Rubens. His marriage, at a very early age, with Van Oort's daughter prevented him from visiting Italy as he had intended; but the master-pieces of Titian, Paul Veronese, Caravaggio, and others, then to be seen in the Flemish galleries, gave him a perfect knowledge of the Italian schools without quitting his native country. Many of these *chef d'œuvres* were copied by him with such force and beauty that Rubens entrusted him with the execution, on a large scale, of many of his small sketches. These were afterwards touched up by the great master, and many of them now pass under his name. In many respects Jordæns's pieces bear a great resemblance to those of his friend; and it is believed that, after Rubens, he is the greatest painter in that style of the Flemish school. There is in both the same abundance of ideas, the same knowledge of *chiar-oscuro*, the same warmth of colouring, truth to nature,

||
Joseph.

and energy of expression; but Jordaens wants the dignity of thought, and is inferior in the choice of forms, the character of his heads, and correctness of drawing. His taste is also not unfrequently defective. Jordaens painted with great rapidity, and, as he lived to a great old age, his works are very numerous. Many of his pieces are preserved in the churches of the Netherlands; and the public galleries of Saxony, France, Sweden, and England, and some of the private collections in the last-named country, contain admirable specimens. Jordaens died at Antwerp in 1678, in his eighty-fifth year. Dr Waagen, in his *Art Treasures of Great Britain*, criticises many of Jordaens' pieces, which he found in all the best private collections in England.

JORDAN. See PALESTINE.

JORTIN, JOHN, D.D., an English divine and miscellaneous writer, whose learning and literary accomplishments have been as unjustly overlooked by posterity as they were ill-rewarded in his own day, was born at London in 1698. His father, a French Protestant of Brittany, had come to England in quest of that religious freedom which was crushed in France when the edict of Nantes was revoked. Educated at the Charter House, he passed thence, in due course, to Jesus College, Cambridge; took his first degree in 1719; was soon after made a fellow of his college; and, in 1722, graduated as M.A. About this time he published, under the title of *Lusus Poetici*, a small volume of Latin poems, which were greatly admired, and are still fairly entitled to rank high among modern efforts of the kind. His merits were rewarded by his college with a living in the country; but after his marriage he fixed his abode in London, where he became known as a highly popular and useful minister. The sermons which he wrote and published during this period are quite memorable for their acuteness of thought and racy freshness of style. Retiring for a time to Eastwell in Kent, to the living of which he had been presented by the Earl of Winchelsea, he was again drawn to London, where, in 1751, he was made rector of St Dunstan's-in-the-East, by his friend Archbishop Herring. Four years later the same influence procured for him the degree of D.D. In 1762 his friend Dr Osbaldiston, promoted in that year to the bishopric of London, made Jortin his domestic chaplain, and besides the living of Kensington, obtained for him a prebendal stall in St Paul's. On being made, in 1764, archdeacon of London, Jortin declined various promotions that were afterwards put in his gift. Fixing his residence at Kensington, he remained there till his death, September 5, 1770, and was buried in the new churchyard of that place.

Jortin's most important works were his *Miscellaneous Observations upon Authors, Ancient and Modern; Remarks upon Ecclesiastical History*; and a *Life of Erasmus*. Besides these, however, he wrote many miscellaneous criticisms,—such as those on Spenser, Milton, Tillotson, Cardinal Pole, Seneca, and others. All these works display a great amount of curious learning, besides a singular acuteness of thought, expressed in terse, and often forcibly eloquent language. A play of gentle satire gives a piquancy and zest to them that keeps up and heightens the interest. The *Life of Erasmus* is based on that by Le Clerc in the *Bibliothèque Choisie*, and embodies a mass of notes and digressions on the literary and ecclesiastical history of that period. Though it can hardly be called a finished life of Erasmus, it affords a mine of rich material, from which a life worthy of the man might be constructed.

JORULLO, a volcano of Mexico. See MEXICO.

JOSEPH, the name of two princes of the house of Hapsburg, emperors of Germany in the eighteenth century.

JOSEPH I., son of Leopold I., was born in 1678, mounted the throne of Hungary in 1689, and was soon after crowned king of the Romans. In 1705 he succeeded his father as Emperor of Germany. Besides the imperial dignity, he in-

herited the war of the Spanish succession, which, begun in 1701, outlasted the whole period of his reign. Studious, tolerant, pious, and humane, he was of too gentle, perhaps weak, a spirit, to interfere personally in the conduct of the war, yet success everywhere attended his arms and those of his allies. Marlborough and Eugene shared between them the honours of Ramillies, Oudenarde, and Malplaquet; and these victories, combined with the surrender of Naples, the rescue of Turin, and the progress of the Archduke Charles in Spain, seemed to have settled the question in favour of Austria. In the midst of these successes, however, Joseph died, rather suddenly, of small-pox, April 17, 1711, and bequeathed the war and the crown to his brother Charles.

JOSEPH II., the eldest son of Maria Theresa and Francis duke of Lorraine, was born March 13, 1741, was elected king of the Romans in 1764, and, on the death of his father in the following year, became emperor of Germany. During his mother's lifetime, he was nominally a co-regent with her in the hereditary states of the house of Austria, and held the command in chief of the army. But his real power was small, as the empress-queen kept in her own hands the administration of her vast dominions. Much of his time was spent in travel, both in his own and adjoining countries. More than once he visited the hereditary enemy of his house, Frederic of Prussia, for whom he cherished an unbounded admiration, and whom in his subsequent political career he seems to have copied, or at least imitated, as his model. Mounting the Austrian throne on the death of Maria Theresa in 1780, he gave a loose to that spirit of innovation and reform which gained for him the title of imperial avant-courier of the French revolution. His reign naturally falls into three epochs of innovation, organization, and restoration. The first period, from 1780 to 1783, was given up to experimental failures. The next three years were devoted to useful governmental reforms. The third and last period was occupied in retracing most of the steps which he had taken in the previous periods, more especially in the first; and the close of it was marked by the revocation of the various edicts by which he had abolished the constitutional liberties of the several parts of the empire. Uniformity became his ruling passion, and to establish it he did not hesitate to overturn and destroy the historical and political peculiarities of the various nations under his sceptre. Declaring that he alone understood the wants of the country, he issued edict after edict, many of them in the highest degree praiseworthy in their object, but arbitrary and despotic in their operations. Disregarding the various nationalities, he parcelled out his dominions into thirteen governments, and subdivided these into circles, establishing in each a uniform civil and judicial administration. He established general toleration in religious matters, suppressed many convents, withdrew the censorship of the press from the clergy, and forbade papal bulls to be published in his realms without the sanction of the government. The Jews were not only permitted to follow whatever calling they chose, but had access allowed them to the colleges and universities. As all these changes were introduced in total disregard of individual and local rights and privileges, they excited in many places a feeling of hatred which at last found vent in rebellion. His attempts to force the German tongue on his Hungarian subjects led to a revolt, of which he did not live to see the end. A similar indiscretion cost him his valuable Belgic provinces. These disasters, combined with the doubtful issue of the Turkish war, in which he took part along with Russia, preyed upon his mind, and cut him off in the midst of his career, February 20, 1790. See AUSTRIA.

JOSEPHUS, FLAVIUS, the celebrated Jewish historian, was born at Jerusalem, A.D. 37, in the first year of Caligula, and four years after the ascension of our Lord. His advantages of birth were very considerable. His father

Joseph II.
||
Josephus.

Josephus. Matthias, sprung from the highest priestly family, belonged to the first of the twenty-four courses. On his mother's side he was descended from the Asmonæan princes. He was very proud of his high birth; and it was a theme on which he used to dwell with a delighted complacency. He complained bitterly of some malignant persons who had ventured to laugh at his claims to an aristocratic lineage. The wealth and high standing of his parents procured for him the best Jewish education. Such was his progress—at least if his own account of himself is to be believed—that at the age of fourteen he was often consulted by learned rabbis on abstruse points of the Jewish law. At the age of sixteen he began to study with peculiar care the doctrines of the three leading Jewish sects, the Pharisees, Sadducees, and Essenes. Though a Pharisee by birth, and in later life a Pharisee both by belief and temperament, he seems at this period to have inclined to the views of the Essenes. Hearing at least that Banus, a celebrated member of that sect, was living in the wilderness with the rigorous asceticism of a hermit, he joined him, and remained under his teaching for three years. Whatever his real creed was, on his return to Jerusalem he allied himself with the Pharisees, and remained faithful to them ever after. At the age of twenty-six he set out for Rome to intercede for some priests of his acquaintance, whom Felix, the procurator of Judea, had sent to be tried there on some trifling charges. Landing safely at Puteoli after a very narrow escape from death by shipwreck in the Adriatic, he gained the friendship of Aliturus, a famous mime of that day, and a favourite of Poppæa, the wife of Nero. Through the good offices of this actor, Josephus not only obtained the pardon of his friends, but was rewarded with many valuable gifts by the empress. On his arrival in Judea, Josephus found his countrymen bent at all hazard on throwing off the Roman yoke. Knowing well the resources of Rome and the hopelessness of successfully resisting her power, he did his best to dissuade the Jews from their mad attempt. His efforts were thrown away; and though he was well aware that the struggle could only issue in the ruin of his country, he determined to share her fall. His own talents for administration were by this time well known, and to him was assigned the task of governing and defending the province of Galilee. His appointment was violently opposed by a strong party in the Sanhedrim at Jerusalem, headed by John of Giscala, who intrigued against him, opposed his policy, and even tried to take his life. But Josephus having fortified the chief cities, and trained his subjects to war, repelled with ease the first attack of the Romans, and this gained the affection and confidence of the Galileans. This success, combined with his own skill in diplomatic manœuvring, enabled him to crush, or at least to defy his enemies in the state. Meanwhile the Romans had assembled a large force; and, in A.D. 67, entering Palestine with Vespasian at their head, laid the whole country in ashes as they advanced. Hopeless of success, and abandoned by the authorities at Jerusalem, Josephus still tried to make head against the foe. Throwing himself into Jotapata he roused the inhabitants to desperate resistance, and conducted the defence of the town for forty-seven days. At the end of that time the town was stormed, and such of the garrison as had not perished in the siege were put to death by the conquerors. When it came to the governor's turn to die, he demanded to be led into the presence of the Roman general. With great adroitness he assured his captor that he was no chance prisoner, but had been commissioned from heaven to foretell that he was shortly to become the sole head of the Roman empire. Vespasian, finding that Josephus, who had predicted the exact number of days that the siege would last, was looked upon as a prophet, spared his life, and even loaded him with valuable presents. He kept him in close confinement, however, for three years, and even

then only set him free on the urgent instance of Titus. Josephus. When the siege of Jerusalem was begun, Josephus who had accompanied his patron Titus on the expedition, tried to persuade his countrymen to yield; but he was treated by them with scorn as a renegade, and even with the Roman soldiers he was very far from popular. When the city fell, Titus offered to grant any favour he might ask. Josephus asked for the lives of his brother and fifty friends, and begged that the sacred books be spared. Besides his request he obtained a valuable estate in Judea, and on returning to Italy with his patron was rewarded with the freedom of the state, a large annual pension, and a house originally occupied by the emperor himself, in compliment to whom he assumed the name of Flavius. Under Titus and Domitian he was confirmed in all his privileges. The remainder of his life was spent chiefly at Rome in literary pursuits. The exact date of his death is not known. He was alive very near the close of the first century, and probably survived a few years of the second.

Josephus was three times married. His first wife was a captive virgin, whom he espoused at the instance of Vespasian, but appears to have subsequently divorced. His second was an Alexandrian lady, whom, he says, "I forsook because her manners pleased me not, though she was the mother of my three children." His third was a Jewess born of a noble Cypriote family, and, as he himself says, "endowed with as laudable manners as any other woman whatsoever." By her he had two sons, Justus and Simonides Agrippa.

Josephus' character was a strange mixture of strength and weakness. His great abilities for administration, both in peace and war, were acknowledged by his countrymen, and proved in his public career. The manner in which he maintained himself in his province of Galilee, perfected his military organization, and conducted the defence of Jotapata, has been already described, and puts beyond doubt his courage as well as his skill. But though he is undoubtedly entitled to great praise for these exploits, his insatiable vanity appears in every line of his narrative, and seduces him into displays of the most amusing vainglory. From the very first he seems to have been spell-bound by the power and majesty of Rome, and to have lost that faith in the destiny of his own people without which there can be no true patriotism. Since he could not check the progress of the Romans, he could at least hope to reach eminence by making himself useful to them. Hence his mean truckling to the emperors, and his flattery of the great nobles whom he met at court,—a flattery so gross as sometimes to fall little short of blasphemy. What his religious creed was, is exceedingly difficult to decide. In a famous passage in his *Antiquities of the Jews*, first quoted by Eusebius, he speaks of Christ as something more than human, and attests his miracles, death, and resurrection. The authenticity of the passage has been very much disputed. If it be admitted (and the external evidence in its favour is very strong), then Josephus must have been a Christian. On the other hand, the common belief that he was not a Christian condemns the passage as spurious. But it happens that Josephus nowhere else in all his writings commits himself in favour of Christianity. As an impartial historian he could not but accept it as an historical fact; yet even though he may have believed in its truth, he was too sceptical and indifferent to make himself a martyr for the sake of any truth or doctrine whatsoever. It is most probable that the passage in question, without being absolutely spurious, has been modified into its present form by Eusebius, who is well known to have often taken such a liberty in his quotations. As a historian Josephus possesses many valuable qualities. His diction is for the most part purely classical, and his narrative is so clear, lively, and vigorous, as to have earned for him, with some show of reason, the title of the Greek Livy. He claims for himself the merit of strict faithfulness, and under

Joshua
Joudpoor.

certain limitations he deserves it. His most important works are his *History of the Jewish War*, and his *Antiquities of the Jews*. The first of these was originally written in the Chaldo-Syriac tongue for the sake of the Jews dwelling beyond the Euphrates, and was afterwards translated by its author into Greek. It is divided into seven books, and gives the history of the Jews from the taking of the city by Antiochus Epiphanes to its destruction by Titus. The second was written in Greek and was published in A.D. 93. It consists of twenty books, and is dedicated to Epaphroditus, a Roman philosopher of that day. Commencing with the creation of the world, it details the history of the Jews in a continuous narrative from the birth of Abraham to the beginning of the war with Rome. Much of it is taken from the Old Testament; but on the main stem of the narrative many traditions have been grafted, chiefly for the purpose of magnifying the importance of his countrymen with the Romans and refuting many of the calumnies against them. His other works are—an *Autobiography*, and two books *Against Apion*, in which he answers the charges brought against the earlier part of his *Antiquities*. The authenticity of this part of the work had been doubted, on the ground of its being passed over in silence by the Greeks.

The best editions of Josephus are those of Hudson, Oxford, 1720; Havercamp, Amst., 1726; Oberthür, Leipzig, 1782-85; Richter, in the *Bibliotheca Patrum*, Leipzig, 1826; and Dindorf, Paris, 1845.

Josephus has been translated into most of the European tongues. Of the English versions may be mentioned those of Lodge; Lestrangle, Lond., 1702; and Whiston, Lond., 1737. The French translation is by Gillet, Paris, 1756; and the Italian by Angiolini, Verona, 1779. There are several German translations; one by J. F. Cotta, Tübingen, 1736; another by J. B. Ott, Zurich, 1736; and the *Jewish War* by J. B. Frise, Altona, 1804-5.

JOSHUA, the assistant and successor of Moses, was the son of Nun, of the tribe of Ephraim. According to the *Tsemach David*, he was born in Egypt, in the year of the Jewish era 2406 (B.C. 1537). In the Bible he is first mentioned as being the victorious commander of the Israelites in their battle against the Amalekites at Rephidim. He distinguished himself by his courage and intelligence during and after the exploration of the land of Canaan, on which occasion he represented his tribe, which was that of Ephraim (Num., xiii., xiv.). Moses, with the Divine sanction, appointed him to command the Israelites, even during his own lifetime. After the death of Moses he led the Israelites over the Jordan, fortified a camp at Gilgal, conquered the southern and middle portions of Canaan, and also some of the northern districts. But the hostile nations, although subdued, were not entirely driven out and destroyed. In the seventh year after entering the land, it was distributed among the various tribes, who then commenced individually to complete the conquest by separate warfare. Joshua died 110 years old (B.C. 1427), and was buried at Timnath-serah on Mount Ephraim. There occur some vestiges of the deeds of Joshua in other historians besides those of the Bible. Procopius mentions a Phœnician inscription near the city of Tingis in Mauritania, the sense of which was—"We are those who fled before the face of Joshua the robber, the son of Nun" (*De Bell. Vandal.* ii. 10). Suidas—"We are the Canaanites whom Joshua the robber persecuted." Compare Fabricii *Codex Pseudepigraphus Veteris Testamenti*, i. 889, sq., and the doubts respecting this statement in Dale, *De Origine et Progressu Idolatriæ*, p. 749, sq.

JOUDPOOR, or MARWAR, an extensive rajpoot principality of Hindustan, bounded on the N.W. by Jessalmere, on the N. by Bikaner, on the E. by Jeypoor, Ajmeer, and Mewar, on the S. by Oodeypoor, and on the W. by the Runn of Cutch and Scinde. It lies between the 25th and

28th degrees of N. Lat., and has an area of 35,672 square miles. The southern and eastern parts of Joudpoor are fertile, being watered by streams that flow from the mountains. They are chiefly cultivated by Jauts, and they produce wheat, barley, and other kinds of grain common in India; also cotton, sugar, &c. The western portion of the country consists principally of desert or pasture lands, on which is bred a hardy race of horses, camels, and cattle. There are also lead mines in the country. The imports consist of cloth, shawls, spices, opium, rice, sugar, steel, and iron. The exports are salt, camels, bullocks, and horses. The principal inhabitants of Joudpoor are Rhatore rajpoots, who are a brave, handsome race of men, of the purest castes. The rajahs of Oodeypoor, Jeypoor, and Joudpoor formerly enjoyed considerable power and consequence, and their alliance was much sought after by the Mogul emperors of Hindustan. The country is described as having been much more populous in ancient times.

The rajahs of Jeypoor and Joudpoor were employed with their followers in the imperial armies, and attained the highest military rank till the time of Arungzebe, who attempted to enforce the capitation tax on his Hindu subjects, and sought to obtain possession of the children of the rajah Jerwont Sing, who died in the year 1678; a circumstance that gave rise to a war, in which the rajpoots were ultimately victorious, and, after the death of Arungzebe, they only paid a nominal allegiance. Being afterwards weakened by dissensions amongst themselves, they became tributary to the Mahrattas, and were only delivered from their yoke by the British in their successful war against the Pindaries. In 1818 a treaty was concluded between the maharajah of Joudpoor and the British, under which the former became tributary to the paramount power, and bound himself to afford military aid when required. At a later period the chief of Joudpoor suffered his tribute to fall into arrear, supplied the stipulated military assistance reluctantly and tardily, protected plunderers, and was believed to have entered into political correspondence having objects hostile to British interests and influence in India. These acts of misconduct were submitted to with great forbearance for a long period, during which the misgovernment and distraction of the country were extreme; and at length, from all these causes, it was deemed necessary to send a mission to Joudpoor demanding reparation. The mission proving ineffectual, a body of troops was moved to enforce that which negotiation had failed to achieve. Their approach alarmed the rajah, who forthwith displayed tokens of submission. The immediate consequences were, the establishment of a council of regency, with a British agent at its head, to carry on the government in conjunction with the rajah. A variety of useful reforms followed. The rajah died a few years after the commencement of the system which led to these beneficial steps, but they were pursued by his successor, Tukht Singh of Ahmadruggur, who was elected to the vacant throne by the feudal chiefs. The administration being thus confided to able hands, the British withdrew from further interference in the internal affairs of Joudpoor.

(E. T.)

JOUDPOOR, a fortified city, and capital of the above principality, is well built, mostly of stone. It is situated on a hill; and carries on a considerable traffic, by means of caravans, with Gujerat and the Deccan. E. Long. 73. 8., N. Lat. 26. 19.

JOUFFROY, THEODORE-SIMON, an eminent French philosopher, was born in 1796 at the village of Pontets, near Mouthe, a town situated on the verdant slopes of the Jura Mountains. As soon as he was able to read, he perused with avidity the pages of Rollin's *History of Rome*, and was to be found in the fields fighting over again the great battles of antiquity, by means of opposing rows of stones, arranged so as to represent the position of the hostile armies.

Joudpoor
Jouffroy.

Jouffroy. At the age of ten he was placed under the care of one of his uncles in the College of Pontarlier, and afterwards removed to that of Dijon, where his skill in French composition attracted general notice. Some fragments of a five-act tragedy, which he composed at this early age, have been preserved among his papers. His precocious talents procured him admission to the Normal school, in which, at the age of twenty, he was appointed tutor in philosophy. He was shortly afterwards appointed to the chair of philosophy in the Collège Bourbon, from which, after a three years' tenure of office, he retired. When the Normal school was closed in 1822, Jouffroy opened in his own house a private course of lectures, embracing the whole range of the philosophical sciences, and began to write extensively on politics, literature, and even natural history, for the periodical press. In 1826 he gave to the world his translation of Dugald Stewart's *Sketches of Moral Philosophy*, with a preface on the distinction between the facts of consciousness and those of the senses. Two years later he resumed his lectures on the history of ancient and modern philosophy in the Normal school, which had been reopened under a new name. The professorship of Greek philosophy and literature in the College of France was his next preferment, and he shortly afterwards entered the arena of politics as a member of the Chamber of Deputies. The duties of these multifarious offices undermined his constitution so seriously, that, not long after his reception into the Academy of Moral Science, he found it necessary to retire to Italy for the benefit of his health. Here he employed his time in completing the translation of Reid's works, the first volume of which had been published eight years before, in 1828. In 1838 he quitted the College of France to occupy the post of librarian of the university, and in 1840 he was summoned by Cousin to assist the Royal Council of Public Instruction. Meanwhile, his health, never robust, again began to give way, and after two years of continually increasing infirmities he died in February 1842, in the forty-seventh year of his age.

In the philosophy of Jouffroy we find, as in that of the Scottish school, a rational appeal to consciousness as the broad basis upon which the inquirer builds his superstructure. The grand object of his observations and speculations is man; and, adopting the most simple division, he views this moral being in a threefold aspect,—as having existed, as now existing, and as destined to exist hereafter. That he is destined to a future existence is deduced from a consideration of his nature. "Every being," says Jouffroy, "is predestined to a certain end, and that of man is indicated by the instinctive and primitive tendencies which result in knowing, acting, and loving." From the blind impulses of childhood he rises till he comes under the dominion of reason, in so far as regards the government of self, and thence to the still higher elevation of submission to universal order, in which we have the central point, the leading maxim of Jouffroy's ethical system. "The beautiful is order expressed, the true is order thought, and the good is order accomplished." All conflicting claims are to be determined by the answer to the question which involves the greatest amount of good, for that must be accordant with universal order. As we rise from this last to the notion of God, the author of order, it follows that morality and religion are different names for obedience to universal order. But in speaking of good, and the greatest amount of good, the old question arises, whence have we evil? The answer to this brings us to the Theodicee of Jouffroy, or scheme in which he defends the Divine government. Evil, according to him, is to be regarded as an obstacle in the path of man, necessary for the development of those very characteristics which make him what he is,—a being possessing liberty and personality. He even ventures to take his station upon the slippery, if not untenable ground, that the difference between man and the lower

animals consists in this, that while the latter are born and die animals, the former is born animal and dies a free being.

The psychological system of Jouffroy is developed in connection with the second of the leading divisions with which we started,—man as at present existing. Here again we have a simple threefold division into the soul as an intellectual agent, as desirous of action, and as it is *per se*, *i.e.*, apart from the foregoing manifestations. As the source of intelligent acts, whether voluntary or involuntary, the soul possesses the two faculties of observation and reason (the former dividing itself into consciousness, external perception, and memory), and, by affording the knowledge of contingent truths, causes the development of reason, by which we reach the knowledge of absolute and necessary truths. To the soul, as acted upon and determined to will, Jouffroy applied the peculiar term *receptivity*, as he applied the term *productivity* to the soul in the aspect under which we have just been considering it. As liable to be acted upon, the *ego* is exposed to an irritation which, according as it is agreeable or the reverse, produces love, which is a positive desire, or hate, which is a negative desire,—desire being the last simple phenomenon of sensibility, and the only thing which can determine the soul to will. Putting out of view all the phenomena included under the productivity and receptivity of the *ego*, Jouffroy brings us to the *ego* itself, which is a force intelligent, free, simple, and always the same. The distinction between soul and body, or, as he preferred expressing it, the distinction between physiologic and psychologic life, was with him a favourite subject, and one which he approaches frequently from different directions, and illustrated in a variety of ways.

JOVELLANOS, GASPARD MELCHIOR DE, one of the most distinguished Spaniards of modern times, whether as a patriot, statesman, or writer, was born in 1744 at Gijon, in Asturia. Though sprung from an ancient and noble family, he early resolved to win fame and wealth for himself. Selecting the law as his profession, he went through the usual courses of study at the universities of Oviedo, Avila, and Alcalá. A judicial appointment at Seville awaited him immediately on his leaving college; but so disinterested was his zeal for the public service that, though but a poor man, he could with difficulty be persuaded to accept the emoluments of his office. In 1778 his integrity and ability were rewarded with the chief judgeship of the King's Court at Madrid, where he gained the friendship of Campomanes, and the leading literati of Spain, and took a prominent part in most of the scientific societies. About this time he had made the acquaintance of the brilliant French adventurer Caburrus; and when that friend afterwards fell a victim to court-intrigue, Jovellanos was for a time involved in his fall. Retiring to the place of his birth, he devoted himself to carrying out many useful schemes for developing the internal resources of the country. He founded the Asturian Institution for the purpose of improving the agriculture, working the mines, and effecting social and educational reform throughout that province. This institution continued his darling project up to the latest hours of his life. Summoned again in 1799 to take his part once more in public affairs, he repaired to the capital, where he was made home secretary-of-state under Manuel de Godoy, the famous Prince of Peace. The looseness of Godoy's private life, and the miserable character of his policy, disgusted Jovellanos, who used his influence to have his principal dismissed. Intrigue followed intrigue; plot was met by counter-plot; and the final result was that the home secretary was banished to the island of Majorca, and there kept a close prisoner, first in a Carthusian convent, and afterwards in the castle of Belver. He beguiled the seven years of his exile in collecting materials for a history of the island; and, in the intervals of these studies, wrote many bold and vigorous addresses to the king on the wretched policy of his prime

Jovianus. minister. The French invasion changed the aspect of affairs. Jovellanos was recalled; and when Joseph Bonaparte mounted the throne, he was offered the portfolio of the interior. Many liberal and well-informed men had recognised the French king; but Jovellanos, sternly keeping aloof, joined the patriotic party, became a member of the central junta, and contributed to re-organize the cortes. As soon as the parliament had been reconstituted, the supreme junta fell into suspicion and was dissolved. Jovellanos, who had been the guiding spirit of its councils, was involved in its fall. To expose the conduct of the cortes, and to defend the junta and himself, were the last labours on which he exercised his pen. So great were his popularity and influence that it became necessary for his enemies to get rid of him. On the 27th Nov. 1811, the dagger of the assassin deprived Spain of one of her best benefactors and most enlightened patriots.

Jovellanos' literary faculties were of a very high order, and were proved by numerous compositions both in prose and verse. His poetical attempts comprised the tragedy of *El Pelayo* (the valiant Goth who fought against the Moors for the freedom of Spain), a collection of miscellaneous pieces, and a translation of the first book of Milton's *Paradise Lost*. None of these, however, reflect any great credit on his name; and had his fame depended on any or all of them, he would have been long ago forgotten. It is especially as a political economist and legislator that Jovellanos will be remembered. A deep, sure thinker, he was, at the same time, a brilliant rhetorician; and, indeed, as a mere writer of Spanish prose, has no equal in modern times. His *Elogios* on the celebrated architect Ventura Rodriguez, and on the king, Charles III., with the vices inherent in that species of composition, combine a memorable depth of thought couched in language of extraordinary beauty. But the greatest of all his works is his *Informe Sobre un Proyecto de Ley Agraria*, a remarkable monument of political foresight and legislative sagacity. No one ever knew or explained better than Jovellanos did in this and some of his other works the causes of his country's downfall, or point out with greater clearness the true means of restoring it to its ancient greatness.

JOVIANUS, FLAVIUS CLAUDIUS, emperor of Rome, A.D. 363-4, was a scion of a noble Mœsian family, and the son of the Comes Veronianus, a distinguished general and high officer of state under Constantius. Jovian, who was captain of the life guards of the Emperor Julian, accompanied his master on his disastrous campaigns against the Persians. When Julian fell in battle, A.D. 363, Jovian was proclaimed by the army his successor. His first task, on assuming the purple, was to conduct his army back to his dominions. He reached the Tigris in safety; but Sapor with his hosts hung upon his rear, and he found it impossible to cross that great river in presence of the Persian army. Sapor, afraid to drive the Romans to despair, proposed terms of peace, which, ignominious as they were, Jovian was fain to accept. The terms were, that the Romans should surrender their conquests beyond the Tigris, along with the fortress of Nisibis, and many other strongholds in Mesopotamia; and should, moreover, bind themselves to give no aid to the Armenians, with whom Persia was then at war. Saving his army and himself, if not his honour, on these conditions, Jovian hastened westwards to arrange the internal affairs of his kingdom. One of his first acts was to proclaim himself a Christian, and to rescind the edicts of his predecessor against the Christians. He granted protection, however, to such of his subjects as adhered to the old system; and when urged by some importunate sectaries to help them against other sectaries, he sternly reminded them that impartiality was the first duty of an emperor. Himself strictly orthodox, he upheld the Nicene creed against the Arians, and reinstated the ecclesiastics who had suffered

at their hands. One of his first acts, indeed, on arriving at Antioch, was to restore his friend Athanasius to his see of Alexandria, from which the machinations of the Arians had driven him. After waiting a few months at Antioch to receive homage from the various provinces of the empire, he set out for Constantinople, and, taking Tarsus on his way, paid the last honours to the ashes of Julian. Continuing his journey in the face of an unusually severe winter, he arrived at Aucyra, where he assumed the consular honours, and a few days later at Dadastana, a frontier town of Galatia and Bithynia. On the following morning (Feb. 17, 364), he was found dead in his bed. His death was attributed to various causes. Some say that he was suffocated by the fumes of a charcoal fire in his chamber; others, by exhalations from the plaster with which it had been newly laid. It is most likely that he died under the dagger or poison of an assassin. He was in the thirty-third year of his age, and had only reigned for seven months. Valentinian was proclaimed his successor by the army.

JOVIUS, PAULUS, a celebrated historical and biographical writer of Italy, was a scion of a noble family of Como, and was born in that town in 1483. His own name was Paolo Giovio, but as his most important works are written in Latin, he is better known under the Latinized form of that name. Choosing medicine as his profession, he studied at the universities of Padua and Pavia; but, in the course of his studies, being seized with the idea of becoming the historian of his age, he abandoned his first choice and devoted himself to the career of letters. His first care was to master the Latin classics chiefly with the view of forming a good Latin style for himself. His success was decisive, and gained him the favour of Leo X., who, on reading some of Giovio's compositions, declared that "after Titus Livius there was no writer more elegant or more eloquent." Honours and rewards soon poured in upon the lucky historian, who was sent upon various important missions to different countries in the train of Giulio de Medici. When this patron afterwards became pope, under the name of Clement VII., he rewarded Giovio's services with the bishopric of Nocera. The historian, however, was too fond of the literary society and other attractions of the capital to exchange them for a see in the country, and accordingly entrusted the duties of his diocese to a deputy. In 1530, when the Emperor Charles V. met the pope in the famous conference of Bologna, Giovio was present, and heard from that monarch's own lips the details of his recent expedition against the Algerian pirates, intending to incorporate them in the historical work on which he was then engaged. After the death of his patron, Giovio was regarded with very little favour by the new pope, Paul III. He lived freely, talked freely, and wrote freely, and was therefore a fair match for the satirists of that day to shoot their arrows at. In religious matters he was described as a latitudinarian, and even as an infidel or an atheist; and it is certain that his morals were very far from being such as those of a bishop ought to be. On the accession of the austere Paul III., Giovio found it convenient to withdraw from the papal court altogether. He retired to his native town where he built himself a delightful villa, and gratified his luxurious tastes with the ample means he had amassed at Rome. The formation of a picture gallery and a museum was the business and the amusement of his later years. But he was too much of a courtier both by habit and disposition to endure the unbroken quiet of a country life. His humorous conversation and genial bonhomie made him a welcome guest at most of the Italian courts, and there he continued to spend a considerable part of each year. In the course of one of these periodical visits at Florence, he was seized with a violent attack of gout which carried him off in December 1552. He was buried in the church of St Lorenzo, where a monument records his virtues, his piety, and his learning.

Jovius.

Juan
Fernandez.

Giovio's works are of very different degrees of excellence and value. His *Historia sui Temporis*, 2 vols., 1550, though it contains much interesting information, is nearly valueless from not being trustworthy. Quite reckless as to the accuracy of any statement, he was too lazy and careless to verify it; and as he picked up a great deal from the gossip of the papal court and the strangers who visited it from all parts of the world, he could not but incorporate much in his history that was false with what was true. The *Historia* is, besides, characterized by so strong a spirit of partiality towards its author's friends and patrons, that it is practically useless as a historical guide. Charles V. detected this weakness of the historian, whom he discarded as a flatterer, and condemned as "writing with the golden pen of history." Giovio had warmly praised Charles' liberality; but when he found that all his arts could not wile a single ducat out of the stingy monarch, he denounced him (though not till after his death), as a man of the most niggardly parsimony. Greatly superior in literary finish as well as moral tone are his *Illustrium Vivorum Vita*, a series of biographical sketches of his most eminent contemporaries. This work, with some small deductions for defects, like those of the *History*, throws a useful side light on the annals of these stirring times. His only other work in Latin was that which first made him; it was entitled *De Piscibus Romanis*, and was dedicated to the Cardinal Louis de Bourbon. Of his vernacular compositions his *Lettere Volgare*, published after his death, are alone worthy of notice. Many of them are in a style of jovial humour that makes them well worth reading even in the present day.

JUAN FERNANDEZ, an island in the South Pacific, about 400 miles W. of the coast of Chile, in S. Lat. 33. 40., and W. Long. 79. It is about 15 miles long by 6 broad, and contains an area of nearly 65 square miles. The coast line is much indented, and the shores generally abrupt. On the north side the mountain called *El Yunque*, from its resemblance to an anvil, attains an elevation of 3000 feet above the sea level. The surface of Fernandez is irregular, with a general declination from N. to S. Its climate is agreeable, the island being neither visited with tempestuous winds nor exposed to the extremes of heat or cold. Little rain falls, but copious dew prevents any injury to vegetation from drought. The valleys on the N. are well sheltered, and a fine black vegetable mould forms the soil. The rocks of the island are either basaltic, trap, or volcanic, and are much disturbed by earthquakes. The soil produces oats, turnips, radishes, apples, strawberries, melons, peaches, figs, sandal-wood, and cork; while off the coast fish of every kind abound, and seals are plentiful. The only quadrupeds, however, that live on the island have been exported thither by accident or otherwise.

Juan Fernandez is only of importance as a calling place for vessels, forming a convenient stage for those sailing between Chile and Australia as well as for those coming round Cape Horn, for Lima or California. Very good water may be had on the island, and also fruits in considerable variety. There are in all three harbours, namely, Port English on the S.E. side, Port Juan on the W., and Cumberland Bay on the N.E. Of these the last is the safest and the only convenient one, having, it is said, 10 fathoms of water at two cables length from the shore, and plenty of fresh water at the head of the bay.

The history of Juan Fernandez is necessarily associated with the events which happened during the exploratory navigations of the Pacific. The island long formed a resting place for the early Spanish and English navigators in these waters. The time of its discovery and the name of the first European who sighted its shores are subjects of doubt. It is certain, however, that one Juan Fernandez visited and gave his name to the island. The advantages which this island afforded for repairing and victualling, ren-

dered it a principal resort of the buccaneers in that part; and, in order to deprive them of supplies, the Spaniards landed a number of Chilean greyhounds on the island for the purpose of exterminating the goats, which were thus driven to the steep and inaccessible elevations. About the year 1750 the Spanish government established a colony here, consisting of civilians, and a small garrison; but the settlement had hardly been established when it was destroyed by an earthquake, the sea having risen and overwhelmed the houses and carried off 35 persons, among whom were the governor, his wife, and children. This convulsion was also severely felt in Chile and Peru.

During the War of Independence in Chile which lasted from the year 1811 to 1818, Fernandez was used by the royalists and republicans respectively, according to the party in power, as a penal settlement for political offenders, and continued in the hands of the Chilean republic after the termination of that strife. The small penitentiary that remained in the island was, however, all but totally destroyed by the earthquake of 1835, and the Chilean government, after making another vain endeavour to colonise it, gave up the attempt and ultimately withdrew the garrison. It then remained unoccupied for a considerable time, until an adventurer from the United States rented the island from Chile and colonized it. This also was unsuccessful, and the settlement broke up. Of late years the occupants have been few in number, amounting to from ten to twenty, who live in rudely constructed huts not far from the sea shore, depending on the natural produce of the soil and on the seal fishing; they also earn small sums of money by supplying the ships with fresh provisions. The advantages possessed by Juan Fernandez as a calling station for vessels have been considerably overrated. Its proximity to the port of Valparaiso is a sufficient reason for shipping bound for Chile not breaking their voyage at the island, except in cases of emergency; while vessels outward bound would have still less occasion to anchor in Cumberland Bay, only 400 miles from the point of departure.

It is well known that here Alexander Selkirk, a Scotsman, lived alone for more than five years; and it is generally believed that the narrative of his sojourn formed the foundation on which Daniel Defoe reared his celebrated work of *Robinson Crusoe*.

About 70 miles W. of Juan Fernandez is the island called Fernandez de Afuera (to seaward), with precipitous shores, on which there is always a high surf.

JUBA I., the son of Hiempsal, king of Numidia, succeeded to the throne on the death of his father, about B.C. 50. In the civil wars of Rome he espoused the cause of Pompey, induced both by a spirit of political conservatism, and by hatred to Cæsar, with whom he had quarrelled violently when young. He gained a signal victory at Utica over Curio, Cæsar's lieutenant in Africa, and barbarously put to death all the prisoners that fell into his hands. When the Pompeian party was overthrown at Pharsalia, Juba still continued faithful to the cause, raised large masses of troops to check the conqueror's passage through Africa, and at one time reduced him to great straits. Joining his forces to those of Scipio and Cato, he encountered Cæsar at Thapsus. The allied army was utterly routed, and Juba fled for refuge to his own dominions. A rebellion had broken out among his subjects in his absence, and Juba, in despair, put an end to his life. His kingdom was reduced into the form of a province, of which the historian Sallust was the first governor. Juba plays a conspicuous part in Addison's tragedy of *Cato*, with whose destiny his own had latterly been linked.

JUBA II., the son of Juba I., was, after his father's death, carried captive by Cæsar to Rome. He was there carefully educated, and, according to Plutarch, "soon equalled, in learning and knowledge, the wisest philoso-

Juba I.
||
Juba II.

Jubilee.

phers of Greece and Rome." Identifying himself with the cause of Augustus, he fought on his side, and was rewarded for his valour with the kingdom of Mauritania. He cultivated the arts of peace, and made himself so much beloved by his subjects that they ranked him among their gods, and raised numerous statues in his honour. He married Selene, or Cleopatra, the daughter of Antony and the Egyptian Cleopatra. Coins and medals commemorating their reign are still extant. Juba's learning was attested by historical writings, which were held in high repute, and were frequently quoted by such men as Pliny and Plutarch as ultimate authorities on many points. They were written in Greek, and, so far as is known, comprised the *History of Africa*, in which he made use of the Punic authorities accessible to him, and thus greatly enhanced their value; *The Antiquities of Assyria and Rome*; *The History of Arabia, with Notes on its Natural History*; *The History of Painting and Painters*; a *History of Theatres*, of which some fragments have been preserved; an *Essay on the Source of the Nile*. The body of these works has been completely lost, but enough of them has been preserved in quotation to show that their loss was really to be regretted. A detailed account of the life and writings of Juba by the Abbé Sévin, is preserved in the *Mémoires de l'Académie des Inscriptions*, vol. iv., p. 457.

JUBILEE, a festival celebrated among the Jews every fifty years, and which led to important changes in their social condition. The word is supposed to be derived from *jobel*, a ram's horn, which was used as the trumpet for proclaiming the arrival of the year of jubilee; or, according to others, it was derived from *jabal*, to *recall* or *return*, because slaves were restored to liberty, and exiles recalled during this year. The periodical recurrence of the jubilee is closely connected with the Sabbatical institutions of Moses. As the seventh year, as well as the seventh day, was to be observed as a period of rest, it follows that every forty-ninth year would be one devoted to rest, and during it no crops were to be sown; but, according to the enactment in Exod. xxv., the year of jubilee was to be one of rest also, so that during two successive years there would be no crops sown. This has appeared such a difficulty to many, that they have endeavoured to prove the year of jubilee to be the forty-ninth instead of the fiftieth; but, in opposition to this, there are insuperable objections, for, in Exod. xxv. 8-17, the fiftieth year is repeatedly referred to as that on which the jubilee was to be celebrated. As to the difficulty, that a famine would follow if, for two successive years, all agricultural operations were neglected, it is to be remembered that the Jews were under a theocracy, and, so long as the Divine command was faithfully obeyed, there was no danger of famine. The injunction which required all the males periodically to visit Jerusalem necessarily left the country exposed to foreign invasion, but so long as they obeyed the Divine injunction, no man was to desire their land.

The object of the jubilee was to prevent the rise of any great disparity between the social condition of individuals. If the institution did not encourage splendid affluence on the one side, it helped to prevent sordid pauperism on the other. It tended to restrain cupidity, and preclude domestic tyranny, as well as to remind the rich and poor of their essential equality. It also served to preserve the distinction of families and tribes down to the coming of Messiah. For it is admitted that the original institution was in actual operation after the Babylonish captivity, as indeed can be proved from Ezek. xlvi. 17; Maccabees vi. 49; Josephus *Antiq.* xiv. 10, 6; and Tacitus, *Hist.* v. 4. The *acceptable year of the Lord*, spoken of by Isaiah before the captivity, must, without doubt, refer to the year of jubilee. Like the Greek *Olympiads* and the Roman *Lustra*, the jubilee was also most useful in a chronological point of view.

In modern times the word jubilee has been used to denote the ceremony at Rome, during which the pope grants plenary indulgence to those who visit the churches of St Peter and St Paul. This jubilee first took place under Boniface VII. in 1300, and was to return every 100 years; but as it was the means of bringing vast wealth to Rome, Clement VI. shortened the time to fifty years. This period was in its turn reduced to thirty-five years, and in 1475, by Sixtus IV., to twenty-five years. The privilege of holding jubilees was also bestowed upon princes and convents, and in process of time the celebration of a jubilee was determined as occasion required.

JUDAS MACCABEUS. See **JEW**s, and **JERUSALEM**.

JUDE, or **JUDAS**. There were two of this name among the twelve apostles—Judas, called also Lebbaeus and Thaddæus (Matt. x. 4; Mark iii. 18), and also Judas Iscariot. Judas is the name of one of our Lord's brethren, but it is not agreed whether our Lord's brother is the same with the apostle of this name. Luke calls him *Ἰούδας ἱακώβου*, which in the English version is translated "Judas, the brother of James." The ellipsis, however, between *Ἰούδας* and *ἱακώβου* is supplied by the old Syriac translator with the word *son*, and not *brother*. Among our Lord's brethren are named James, Joses, and Judas. If, with Helvidius among the ancients, and Kuinoel, Neander, and a few other modern commentators, we were to consider our Lord's brethren to be children of Joseph and the Blessed Virgin, we should be under the necessity of supposing that there was a James, a Joses, and a Judas, who were uterine brothers of our Lord, together with the apostles James and Judas, who were children of Mary, the sister or cousin of the Virgin. If, however, the hypothesis of their being children of the Blessed Virgin be rejected, there remains for us only a choice between the two opinions, that our Lord's brethren were children of Joseph by a former wife (Escha, or Salome, according to an apocryphal tradition), which was the sentiment of the majority of the fathers (still received in the Oriental Church), and that adopted in the Western Church, and first broached by St Jerome, that the brethren of our Lord were his cousins, as being children of Mary, the wife of Cleophas, who must therefore be considered as the same with Alphæus. If we consider James, the brother of our Lord, to be a different person from James the son of Alphæus, and not one of the twelve, Jude, the brother of James, must consequently be placed in the same category; but if they are one and the same, Jude must be considered as the person who is numbered with our Lord's apostles. We are not informed as to the time of the vocation of the Apostle Jude to that dignity. Only one circumstance relating to him is recorded in the Gospels. Nor have we any account given of his proceedings after our Lord's resurrection, for the traditional notices which have been preserved of him rest on no very certain foundation. It has been asserted that he was sent to Edessa, to Abgarus, king of Osroene (Jerome *Annot. in Matt.*), and that he preached in Syria, Arabia, Mesopotamia, and Persia; in which latter country he suffered martyrdom (Lardner's *Hist. of the Apostles*). Jude the Apostle is commemorated in the Western church, together with the Apostle Simon (the name, also, of one of our Lord's brethren) on the 8th of October. There is an interesting account preserved by Hegesippus (Eusebius, *Hist. Eccles.* iii. 20) concerning some of Jude's posterity:—"When Domitian," he observes, "inquired after David's posterity, some grandsons of Jude, called the Lord's brother, were brought into his presence. Being asked concerning their possessions and mode of life, they assured him that they had thirty-nine acres of land, the value of which was 9000 denarii, out of which they paid him taxes, and maintained themselves by the labour of their hands. The truth of this was confirmed by the hardness of their hands. Being asked concerning

Juggernath.

Christ and the nature of his kingdom, they replied that it was not a kingdom of this world, but of a heavenly and angelic nature; that it would be manifested at the end of the world, when he would come in glory to judge the living and the dead, and render to every man according to his works. Having observed their humble condition and their harmless principles, he dismissed them with contempt, after which they ruled the churches, both as witnesses and relatives of the Lord."

JUDE, *Epistle of*, is placed by Eusebius among the *controverted books*, having been rejected by many of the ancients. It is, however, cited by Clemens Alexandrinus (*Strom.* iii. 431), by Origen (*Com. in Matt.*, &c., &c.), and by Tertullian (*De Habit. Fam.*). It is also included among the books of the New Testament in the ancient catalogue discovered by Muratori, a work of the second century. It is found in the catalogues of the Councils of Laodicea, Hippo, and Carthage, and in the apostolical canons, but is wanting in the Peshito or ancient Syriac version. It is, however, cited as of authority by Ephrem. In modern times its apostolic source at least, if not its canonicity, was called in question by Luther, Grotius, Bolten, Dahl, Berger, and Michaelis, but it is acknowledged by most to be genuine. Indeed, the doubts thrown upon its genuineness arose solely from the writer having cited two apocryphal books. In regard to the authorship moderns are divided in opinion between Jude the apostle and Jude the Lord's brother, if indeed they be different persons; Hug and De Wette ascribe it to the latter. The author simply calls himself Jude, the brother of James, and a servant of Jesus Christ. This form of expression has given rise to various conjectures. Dr Lardner supposes that Jude's Epistle was written between the years 64 and 66, Beausobre and L'Enfant between 70 and 75 (from which Dodwell and Cave do not materially differ), and Dr Mill fixes it to the year 90. If Jude has quoted the apocryphal book of Enoch, as seems to be agreed upon by most modern critics, and if this book was written, as Lücke thinks, after the destruction of Jerusalem, the age of our Epistle best accords with the date assigned to it by Mill.

JUDEA. See PALESTINE.

JUDENBURG (the ancient *Idunum*), a town in the Austrian province of Styria, capital of a cognominal circle, on the Mur, 38 miles W. of Grätz. In the middle ages it carried on an important trade with Germany and Italy, but at present it has scarcely any trade, and its chief manufactures are gunpowder and ironware. On 7th April 1797, an armistice was signed here between the French and Austrians. Pop. about 2000.

JUGDULUK, a village of Afghanistan, in the defiles between Jelalabad and Cabool, 5375 feet above the level of the sea, in N. Lat. 34. 25., E. Long. 69. 46. It was one of the principal scenes of the massacre of the British troops retreating from Cabool in the beginning of 1842.

JUGGERNATH, properly JAGATNATHA (*the Lord of the World*), a celebrated temple and place of Hindu worship, on the sea-coast of Orissa, and district of Cuttack, esteemed the most sacred of all the Hindu religious establishments. It is situated a few miles to the N.E. of the Chilka Lake, close to the sea shore, and when seen from a distance is a shapeless mass of building, but forms an excellent landmark for navigators in approaching so low a coast. The temple of Juggernath stands within a square area inclosed by a lofty stone wall measuring 650 feet on a side. The inclosure is entered on the E. by a grand gateway, from which a broad flight of steps gives access to a terrace 20 feet in height, inclosed by a second wall 445 feet square. From this platform the great pagoda rises to the height of about 180 feet from the platform. At the gate of the outward wall are two large statues of singhs, an imaginary or fabulous animal, nearly as large as an elephant. Juggernath is said to be one of the incarnations of Vishnu;

but the original dedication of the temple is involved in fable. Jugurtha. It is known to have existed for above 800 years, and is mentioned as a celebrated place of Hindu worship by the oldest Mohammedan historians of India. The idol itself is a huge disgusting image of the human form, made of wood, with a frightful black visage, and a distended mouth foaming with blood. On each side of him is another image, one part of which is painted white, and the other yellow; the first is said to be the image of his sister Shubudra, the other that of his brother Balaram. The throne of the idol is placed on a stupendous car or moveable tower about 60 feet high, resting on wheels, which, from the weight, indent the ground deeply as they move along. Formerly devotees threw themselves under the wheels, and were crushed to death, but these horrible deeds are now prohibited by the British government. The tower is drawn along by the people by means of ropes, amidst the shouts of the ignorant multitude; and upon the car are the priests and attendants. The concourse of Hindu pilgrims to this shrine is immense; the aged come to die at Juggernath; and so numerous are these pilgrims, that the approach to it is known at the distance of 50 miles by the quantity of human bones strewed on the way. The impurity of the Hindu idolatry is strongly indicated by the indecent sculptures that cover the walls of the temple and the sides of the machine.

The resort of Hindu pilgrims to Juggernath is the source of a considerable revenue; and the British, by the conquest of the province of Cuttack from the Mahrattas in 1803, had succeeded to all their rights as sovereigns, and consequently to the right of collecting this tax on the superstition of the inhabitants. The pilgrim tax thus became a regular source of revenue to the East India Company. At home the measure was disapproved by the Court of Directors, but the president of the Board of Control, Mr Dundas, took a different view; and, through his influence, a despatch was framed, to the effect that, as the tax on pilgrims had been levied under Mohammedan and Mahratta governments, there did not appear any objection to its continuance under the British government. In 1839, under the administration of Lord Auckland, the subject came again under notice, when arrangements were made for the abolition of the pilgrim tax, and shortly after the British government wholly disconnected itself from idolatrous worship. It is a circumstance for congratulation that the government has thus purged itself from a foul scandal, which lowered its character and impaired its usefulness. The superintendence of the temple is now exercised by the rajah of Khoordah, who is forbidden to receive any payments from pilgrims except such as may be voluntarily offered. One of the chief periods of pilgrimage is in March, when the Dole Jattrah takes place; and the other in July, when the Ruth Jattrah is celebrated. Distant S.W. from Calcutta 250 miles. E. Long. 86. 5., N. Lat. 19. 49. (E. T.)

JUGURTHA, the Numidian usurper, occupies a prominent place in the history of Rome, not only from the greatness of his own exploits, but as having furnished the subject of one of the most masterly pieces of historical writing that antiquity has handed down to modern times. He was born shortly before the middle of the second century B.C. He was the illegitimate child of Mastanabal, the youngest son of Masinissa, king of Numidia. He was brought up by his uncle, Micipsa, and at an early age gave signs of that warlike, intriguing, and ambitious spirit which enabled him for some years to defy the generals and armies of Rome itself. In the hope that he might fall in battle, Micipsa gave him the command of the troops which he was sending into Spain to help the Romans in the Numantine war. Jugurtha distinguished himself greatly, and returning home in safety at the end of the war, was adopted by Micipsa, and named joint-heir with his own sons, Adherbal and Hiempsal. Micipsa died soon after, and Jugurtha,

Julian
Calendar
||
Julianus.

aspiring to the undivided sovereignty, caused Hiempsal to be murdered, and Adherbal only escaped the same fate by a timely flight to Rome, where he laid his case before the senate. A commission was appointed to decide upon the claims of the rivals. By means of unscrupulous bribery Jugurtha secured the largest and best portion of his uncle's kingdom. Scarcely had peace been restored, when Jugurtha invaded his cousin's territory, defeated him in the open field, shut him up in Cirta, his capital, and having taken that city by storm, cruelly put him to death. This outrage excited great indignation at Rome, and war was immediately declared against the usurper. Partly by a desperate resistance, partly by skilful bribery, Jugurtha foiled the generals opposed to him, and was by them confirmed in possession of the whole realm of Numidia. The senate refused to sanction this arrangement, and Jugurtha repaired to Rome under the public guarantee to plead his cause in person before the senate. Unstinted bribery was as effective now as ever, and he practically gained his case by prevailing on the senate to suspend judgment altogether. This success encouraged him to fresh outrages. Hearing that his cousin Massira was plotting to supplant him on the Numidian throne, he caused him to be assassinated. The murder was traced to him; but as he had come to Italy under the public guarantee, it was impossible to punish him in Rome. He was immediately ordered out of Italy. On quitting the city, he is said to have looked back upon it, and to have apostrophized it as "venalis, et mature peritura si emptorem inveniet." War was now formally declared, B.C. 111, and the campaign opened disastrously for the Romans. Aulus Posthumius was surprised, surrounded, and, with his whole army, sent under the yoke. Metellus, the new consul, next took the field with fresh troops, and prosecuted the war with great vigour. Bribes were offered to him in vain by his wily adversary, who was speedily reduced to desperate straits. Caius Marius next took the command; but Jugurtha, aided by the Mauritanian Bocchus, still continued to make head against this terrible foe. Town after town fell into the hands of Marius, and a bloody pitched battle at last laid Africa at his feet. Bocchus temporized, and, as the price of his own safety, delivered up his ally to the Romans. Jugurtha was carried to Rome, where, after decking the triumph of Marius, he was thrown into the Mamertine prison, and cruelly put to death, B.C. 106. (Sallust's *Jugurtha*; Plutarch's *Life of Marius*; Diodorus Siculus, *Fragm.*, vol. x., p. 141.)

JULIAN CALENDAR. See CALENDAR.

JULIANUS, FLAVIUS CLAUDIUS, emperor of Rome from December 361 to June 363, was the son of Julius Constantius, and nephew of Constantine the Great, and was born in A.D. 331. On the death of Constantine, the soldiers, to assure the empire to his sons, murdered his collateral relations. Julian and his half-brother Gallus alone escaped. Constantius the new emperor hearing that his cousin was still in life, consigned him to the care of Eusebius, bishop of Nicomedia. By this prelate and the learned eunuch Mardonius, Julian was trained not only in every branch of polite literature, but in the doctrines of the Christian system. At a befitting age he was made a reader in the church, and in that capacity used to expound the Scriptures to the people. At the age of fourteen he was transferred to the castle of Macellum, where he and Gallus were educated together under the strictest surveillance. When Constantius, who was childless, found it necessary to adopt Gallus as his heir, Julian returned to the capital to carry on his studies, and there made the friendship of the sophist Libanius. Reasons of state induced his cousin to send him back once more to Nicomedia, where he fell under the sway of Maximus of Ephesus, and other Platonists. After the tragic death of Gallus in 355, Julian was sent to Milan, where he remained for some months as

Julianus.
closely watched and guarded as ever. More than once his life, endangered by the suspicions and caprice of his imperial cousin, was saved at the instance of the empress Eusebia. By her advice he was now invited to court, and named heir to the purple. The emperor next gave him his sister Helena in marriage, and assigned to him the government of Gaul, which the hordes of German invaders were then laying waste with fire and sword. In four successful campaigns Julian displayed his bravery and military skill. The Germans were driven across the Rhine, and Chnodomar, their most powerful king, taken prisoner. Fixing his headquarters at Lutetia (Paris), he set himself to repair the havoc of the barbarian invasions. Cities were rebuilt, impost and taxes abolished, and rapacious governors punished. All these reforms were brought about in such a way as to gain to their author the highest credit for gentleness and clemency, as well as wisdom and sagacity. When the war with Sapor, king of Persia, broke out, Constantius, alarmed at his cousin's growing popularity, took the occasion to draft away to the East the veteran legions of Gaul. When they were preparing to depart, Julian assembled them at Paris, and formally bade them farewell. His address was received with shouts of displeasure, and before he could understand what was meant he found himself saluted as emperor. His first step was to announce the fact to his cousin, whose timely death saved the Romans from the scourge of a civil war. Julian hastened to the capital, and was quietly invested with the imperial purple. His first act was to put an end to the reckless and wasteful extravagance which had prevailed at the court of his predecessor. He himself affected the extreme of simplicity, always walked on foot, prided himself on the length of his nails, and the inky blackness of his hands; and, in his *Misopogon*, "celebrates with visible complacency the shaggy and *populous* beard, which he fondly cherished after the example of the philosophers of Greece" (Gibbon, ch. xxii.). To carry out his reforms he established, at Chalcedon, on the Asiatic side of the Bosphorus, an extraordinary chamber of justice, consisting of six judges of the highest rank in the state and army. The object of this tribunal was to bring to trial such public men as in the last reign had abused their influence with the emperor to grind down and oppress the people. Many guilty persons were condemned and punished, but unfortunately some who were quite innocent shared the same fate. In the latter class was Ursulus, the able and honest treasurer of the empire, "over whose fate," in the words of the historian Ammianus, "justice herself appeared to weep." Among the wise edicts which Julian had published on ascending the throne, was one proclaiming universal toleration. His own conduct, however, was soon marked by a keen and even bitter hatred to Christianity. Though brought up in that faith, he had never owned himself its disciple; and the name of the Pagan would have suited him better than that of the Apostate, which was fixed upon him when he abolished Christianity as the religion of the empire. Revoking the edict of universal toleration, he persecuted the Christians, confiscated the revenues of their churches, and taxed them heavily to rebuild the heathen temples, which, in their day of power, they had pulled down and plundered. He excluded them from every, even the meanest, office of state; and by a special edict forbade them either to study or to teach polite literature. With his connivance, if not at his instigation, the whole paganism of the empire rose in arms against the disciples of the new faith, and imprisoned, tortured, and even offered them as victims on the altars of the heathen gods. Such of the unfortunates as claimed Julian's protection were answered with the heartless taunt that "Every Christian is called upon to suffer." Among the victims was the aged Marcus, bishop of Arctunsa, who had saved Julian, when a boy, from the general butchery of his father's

Julianus. family. When the emperor heard that his old preserver had been ignominiously dragged through the mud and tortured to death, he allowed the perpetrators of the foul deed to pass unpunished. The feeble efforts which he made to check these and similar excesses only served to stimulate the fanaticism of the persecutors. Meanwhile, Julian had resolved to make war upon Sapor, king of Persia. On his way to the East he made Antioch his head-quarters till the expedition should be completely organized. During his sixth months' residence in that city, his unkingly dress and manners, ill-trimmed beard, and strange retinue, offered a tempting mark to the shafts of ridicule, and gave abundant occupation to the epigrammatists and small wits of the place. Julian avenged himself in his famous satire of *Misopogon*, or Beard-hater, the most trenchant and original of his works. He afterwards took a far more terrible vengeance, by appointing to the government of the city one of the worst men in his dominions. When the inhabitants remonstrated, he replied, "I well know that Alexander is a bad man, and does not deserve a government; but he is exactly such a governor as the greedy and insolent Antiochians deserve." When everything was at last ready, Julian set out on his expedition with a brilliant and well-appointed army of 65,000 men. The campaign brought out the better qualities of his nature. He was indefatigably active, and exposed himself to every hardship like the meanest soldier. Success at first attended his arms. He crossed the Euphrates, and afterwards the Tigris, without loss, took several strongly fortified towns, and defeated the Persians in many skirmishes. His nimble foe, however, refused to close with him in a pitched battle, but his clouds of light horsemen cut off the foraging parties, and the Romans were soon reduced to great straits for supplies. Still, they held out so gallantly, that Sapor seriously thought of suing for peace, when, in a skirmish of outposts, the Roman emperor fell mortally wounded. Brought back to his tent, and feeling that he had but a short time to live, he spent his last hours in discoursing with his friends on the immortality of the soul. He reviewed his reign, and declared himself satisfied with his own conduct, and as having neither penitence nor remorse to express for anything that he had done. He died on the 27th July 363, after a reign of one year and nearly seven months. In accordance with his own instructions, his ashes were carried to Tarsus, in Cilicia, where a stately monument was erected to his memory by his successor, Jovian.

The character of Julian is one of the most interesting and difficult of historical problems. He seemed to have embodied, if not reconciled in himself, qualities in their own nature most opposite. With brilliant endowments, he often acted as for the most part fools only act. Naturally, and to the last humane, he allowed his kingdom to be drenched with the blood of his Christian, in other words, his best subjects. Many of his acts and edicts were lofty in aim and wise in effect; others were illogical and arbitrary. His personal morals were austere pure, and many of his meanest subjects were both better clad and better fed than he; yet he lavished his wealth and hospitalities on the sophists whom he chose as his friends. With all his modesty and self-denial, he had no small share of vanity, which showed itself in his eager thirsting for posthumous fame. To be remembered, when other monarchs of his line should be forgotten, was to him a prize worth any amount of hardship and self-sacrifice. When in early life his chances of the throne were very small, he sought to immortalize himself as an author; and, to make his character as marked and unique as possible, he affected those eccentricities from which in later life he failed, if indeed he ever tried, to disengage himself. When he came to assume the purple, his imagination glowed with the hope of doing some great deed that should transmit his name to prosperity. His visions of

military glory were soon dispelled, when he found, at first, no foe against whom to concentrate the whole power of his empire. In the internal administration of his kingdom he found "ample room and verge enough" for reform, which he was not long of effecting. Such services as these, however, posterity was likely to regard as mere acts of duty, for which no special credit was due to him. A much better chance lay in his restoring the ancient greatness of the republic and the empire, and with it the religious system under which its triumphs had been achieved. Paganism, though on the wane, was still able to oppose a strong front to the new faith. Personally, Julian had little reason to prefer the new to the old. From his own relations—all adherents of the former—he had suffered nothing but cruel maltreatment, and more than once had narrowly escaped with his life, while the Christian church itself presented a sad spectacle of schism, disunion, angry controversy, and intolerance. On the other hand the friends of his youth, as of his riper years, had all been pagans, and by them he had uniformly been caressed, flattered, and admired; while the unity and splendid ceremonies of the pagan worship were probably not without their influence. It is ridiculous to suppose that he did not see through the absurdities of the old mythology; but it was part of his tactics to profess reverence for the deities of Rome, and he himself used to sacrifice to the mother of the gods and compose orations in honour of Apollo, whose son he ordered himself to be called. The sophists, his chosen friends, were not slow to confirm what his vanity had already whispered; and it is not difficult to see why they should have done so. Encouraged by their advice and the hopes of immortal fame, of which he might count himself secure, if successful, Julian came forward as the champion of paganism. It would almost seem as if, in doing so, he had done violence to the dictates of his conscience and the early religious impressions, from which his chequered career could hardly have set him free. If, in coming to this conclusion, we disregard the fierce attacks of the Christian fathers, Gregory of Nazianzus, Cyril, and Jerome, who accused him of downright hypocrisy, it is much less easy to reject the testimony of his own friend Libanius, and the historian Ammianus, who unconsciously make a similar admission.

Even had he not reigned, Julian's name would, in all probability, have been saved from oblivion by his writings. Of these the best are his *Letters*, especially that to Themistius, in which, in a lofty style, and with great closeness and force of reasoning, he details the duties of a sovereign. His *Cæsars*, or *The Banquet*, is a satire in which the Roman emperors are described as one by one seating themselves round a table in heaven, and defending themselves from the attacks made on the vices, crimes, and follies of their earthly career by Silenus. Gibbon pronounces this work one of the most agreeable and instructive productions of ancient wit. His *Oration*s are less interesting. His narrative of his *Gaulic Campaigns*, as also his *Refutation of the Christian Religion*, has unfortunately perished. The best editions of Julian's complete works are those of Petavius, Paris, 1630; and of Ezechieel Spanheim, Leipzig, 1696. (*Life of Julian*, in Gibbon's *Decline and Fall*; *Vie de Julien*, by the Abbé de la Bletterie; *Vie de Julien*, by M. Thourlet; *Histoire de Julien*, by M. Jondot; Neander's *Ueber den Kaiser Julian*, &c., &c.)

JULICH, the capital of a cognominal circle in the Prussian province of Aix-la-Chapelle, is situated on the Roer, 15 miles N.E. of Aix-la-Chapelle, and 24 miles W. of Cologne. It is strongly fortified, and has a citadel of great strength. Chief manufactures, woollen cloth, leather, and soap. Jülich is the ancient *Juliacum*, and is said to have been founded by Julius Cæsar. Pop. 2890.

JULINDER DOOAB, a tract of country in Upper India, lying, as the word Dooab implies, between two rivers,

Julich.
||
Julinder
Dooab.

Julius I. which, in this case, are the Beas and the Sutlej. It has an area of about 374 square miles. This territory came into British possession during the earlier operations against the Seikhs, and was permanently retained as a portion of the British dominions under the Treaty of Lahore, concluded in March 1846, whereby the Maharajah of the Punjab ceded to the East India Company, in perpetual sovereignty, all his territory between the Beas and the Sutlej. The tract is situated between the 31st and 33d degrees of N. Latitude.

Julius II.

JULIUS I. succeeded Marcus on the papal throne A.D. 337. It was during his pontificate that the church was embroiled by the Arian heresy. Athanasius, bishop of Alexandria, driven from his see by the Eusebians, had repaired to Rome to defend himself from the charges brought against him by them. Julius received him with honour; and, in a council held at Rome in 342, but which the Eusebians refused to attend, the deposed bishop was held to have completely cleared himself. The Eusebians complained, and another council was held at Sardica in Illyria. This council likewise they refused to attend; and Athanasius was again acquitted. The two parties then mutually communicated each other, the Eastern faction being peculiarly indignant at Julius, whom they accused of being the author of the whole evil. Another cause of their bitter feeling seems to have been that the council invested the bishop of Rome with the power of arbitrating on matters relating to the deposition of a bishop. After a pontificate of fifteen years, Julius died in 352. Two letters of his are extant, both bearing upon the affair of Athanasius. Some others have been spuriously ascribed to him.

JULIUS II., one of the greatest of all the successors of St Peter, came to the throne on the death of Pius III. in Nov. 1503. He was the nephew of Sixtus IV., but his own parents were obscure and poor persons in the little town of Abizal, near Savona. Entering the church and occupying successively the sees of Carpentras, Ostia, Albano, Bologna, and Avignon, he had reached all but the highest grade in the church as Cardinal della Rovere. From an early age he had taken an active part in all the political movements of that stirring age. Few of his contemporaries were so well able as he, either to read or to control the signs of the times; and he was likened to Virgil's Neptune lifting his serene head above the billows, and calming their fury with a glance. His keen sagacity pierced into the inner core of men. His mind was capable of forming vast designs, while his intellect, fertility of resource, and indomitable will enabled him to give them practical effect. These qualities, combined with a boundless ambition, a courage which nothing could daunt, and an insatiable passion for war, went to form a character apparently better adapted to lead great armies, or govern a great state, than to diffuse and maintain peace and good-will among men. The great idea of his life, as soon as he assumed the tiara, was to enlarge the territorial domains of the church. This aim he always kept steadily in view, and before his death he could boast that he had laid the foundations of such a power as never pope before him had possessed. His first step was to rid himself of Cæsar Borgia, whose crimes, passions, and power had long made his name a watchword of terror in Rome. Julius was dexterous enough to drive this scourge of the country out of his dukedom and possessions in the Romagna; but he found that his claims to the conquered lands were contested by the Venetians who had seized Ravenna, Rimini, and other important places. They were determined to keep them at all hazards, and Julius was far too weak to cope with them in war unaided. It was to no purpose that they offered to do him homage and pay him tribute for what they looked upon as their lawful conquests. The pope refused to content himself with anything short of their unconditional surrender of these cities and lands to the church, as repre-

sented in his own person. The Venetians were obstinate, and Julius organized against them, in 1508, the celebrated "League of Cambray," by which the Emperor Maximilian of Germany, Louis XII. of France, and the Duke of Ferrara, bound themselves to blot out the republic of Venice from the map of Europe, and parcel out its dependencies among them. But the pope, resolute as he was to assert his rights to the hereditary possessions of the church, had no desire to see either French or Germans (or, as he called them, "the barbarians") secure a permanent foothold in the Italian peninsula. No sooner, therefore, had he vindicated his ancestral rights, and been confirmed in his conquests of Parma, Piacenza, and Reggio, than he concluded peace with Venice, which, after a disastrous war of two years, was ready to listen to his overtures. To rid Italy of "the barbarians," he tried to sow the seeds of discord between the French and Germans. Foiled in this attempt, he called in the Swiss to his aid, and with their help took the field in person against the French in Lombardy. In 1511 he laid siege to the town of Mirandola, took it, and caused himself to be drawn over the frozen trenches, and through the breach into the ruins. The summer campaign was less prosperous, and was marked by the loss of Bologna to the pope. In the autumn, however, he formed what he was pleased to call a "holy" league with the Swiss and Venetians, and the kings of Spain and England. The allied troops took the field in the following year. Under their cruel but able general Gaston de Foix, the French made a most gallant resistance; but in the desperate fight of Ravenna they were utterly routed. Their commander was killed, and the relics of the army were speedily driven across the frontier into their own country. But though he had thus rid himself of the French, he had little reason to pride himself on his success. Italy was as full as ever of "barbarians"—the motley armies of Spain, Switzerland, and Germany,—who took upon themselves to remodel the internal constitution of such of the Italian states as were in their power. Julius did not live to see all the evils which his policy entailed on his country, as he died after a brief illness, Feb. 21, 1513. But he witnessed the overthrow of the Florentine republic, and the beginnings of other changes well calculated to fill with gloomy forebodings a mind so acutely alive as his to the political tendencies of the age.

Though Julius left no literary record of his genius, he was a warm and enlightened patron of literature and the fine arts. He treated with marked honour the leading scholars of that age, Bembo, Castiglione, Flaminio, and others, and enriched the library of the Vatican with many rare and precious books and MSS. He gave full scope to the genius of Bramante, and with his own hand laid the foundation of the new church of St Peter, which that architect had planned. Michael Angelo and Raphael owed their early fame to his patronage. Perugino reached in his pontificate the acme of his renown, and Leonardo da Vinci then first came forward to share with Michael Angelo the suffrages of the world. The reign of Julius in short was the golden dawn of that day which reached its splendid noon under Leo X.

JULIUS III., Cardinal del Monte, whose family name was Giocchi, succeeded Paul III. in 1550. One of his first acts was to recommence the sittings of the Council of Trent, which had been discontinued under his predecessor. A silly quarrel between him and Ottavio Farnese, involved France and the Empire in a bloody war. One of its consequences was another suspension of the Council of Trent; for which Julius was secretly very thankful, as the debates had threatened to be troublesome and complicated. The closing of the council seems to have been the last act of his public life. The remainder of his days were spent in an imbecile and immoral self-indulgence. He died in 1555, in the sixty-fourth year of his age, and sixth of his pontificate.

Julius III.

Jumbasier
||
Junagur.

JUMBASIER, a town of Hindustan, in the province of Gujerat, and district of Broach, situated on the headland projecting between the estuaries of the rivers Nerbudda and Myhee. It exports to Bombay and other places, cotton, grain, oil, and piece-goods. The tide rises from five to six fathoms. It is 28 miles from the town of Broach. N. Lat. 22. 2., E. Long. 72. 50.

JUMILLA, a town of Spain, province of Murcia, on the S. declivity of a hill, the summit of which is crowned by a castle, 37 miles N. by W. of Murcia. The streets, though mostly narrow, are paved and clean, and the houses are generally well built. Jumilla is the see of a bishop, and has two handsome parish churches, one of which is adorned with fine frescoes and paintings, two convents, an hospital, and a public granary. There are a number of oil and corn mills in the town, and several branches of manufactures are carried on. Pop. 8397.

JUMNA. This celebrated river takes its rise in the Himalaya Mountains, at the south-western base of the group called the Jumnotri Peaks, at an elevation of 10,849 feet above the sea-level, and in Lat. 31., Long. 78. 32. It first holds a course, for about 100 miles, in a S.W. direction, through the mountainous districts of Gurwhal and the Dehra Dhoon, during which it receives the waters of the Berai-Ganga, the Budeear, Comalda, Rickna, Khootnee, Aglar, Tonse, Giree, and Asun. From the point of its confluence with the last named stream, the Jumna takes a direction, first westerly, then southerly, and flowing through a ravine in the Sewalik Mountains, it enters the plains of Hindustan in Lat. 30. 20., Long. 77. 38. After emerging from the mountains, it throws off the Delhi and Dooab Canals, the former issuing from its right, and the latter from its left bank. It then directs its course in a parallel line to that of the Ganges, until, after passing the cities of Delhi and Agra, it falls into the Ganges at Allahabad, in which, as the holier and rather the larger stream, its name is absorbed. Between Delhi and Allahabad the Jumna receives the waters of many considerable streams, among which may be enumerated the Chumbul, the Sind, the Betwa, and the Cane. Jacquemont styles the Jumna in the lower part of its course, an enormous river; in the rainy season, it is in some places a mile in width, with a very rapid current. The total length of this river, from its source to its confluence with the Ganges at Allahabad, is 860 miles. The streams at the junction are nearly equal in volume; the Ganges, the deeper, with yellow water; the Jumna, the more rapid, with water as clear as crystal, but considered less palatable and wholesome than that of its fellow. The confluence of the two rivers takes place in Lat. 25. 26., Long. 81. 45. The Jumna is only useful as a military barrier to the British territories during the rainy season, when all field operations are impracticable. At this period it may be navigated by flat-bottomed boats of considerable burden; but at other times it is of no utility to commerce. Above its junction with the Chumbul, or 10 miles below the fort of Etayeh, it is fordable, except for a few weeks during the rainy season. From Calpee to its junction with the Ganges there is no obstruction, and only one place where, in the dry season, the passage is rendered difficult by a bank of limestone. It is mentioned by Bishop Heber that its waters act on strangers like the Cheltenham waters. (E. T.)

JUNAGUR, a town of Hindustan, in the province of Gujerat, possessed by an independent native chief, now one of the British allies. He and other chiefs engaged, in 1808, with the Bombay government, not to connive at piracy, and to permit a free and open commerce with the British vessels, on paying the stipulated duties. The chief, a Musselman, styled the Nawaub of Junagur, possesses a territory estimated to contain a population of 284,300 souls. Junagur is distant N.W. from Bombay 235 miles. Lat. 21. 31., Long. 70. 31.

Jungfrau
||
Junius.

JUNGFRAU (*i.e.*, VIRGIN), one of the most picturesque mountains in Switzerland, rises very steeply from the valley of Lauterbrunnen to the height of 13,671 feet. It is one of the ridges of the Bernese Alps, separating the cantons of Valais and Berne. It is in reality a group of mountains, increasing gradually in height, and separated by deep ravines. Of these heights, the Silberhörner, on the W. side, are remarkable for the graceful forms assumed by the snow which covers them. The Jungfrau, like the other mountains of the chain to which it belongs, is characterized by its sharp edge, the summit being not more than two feet broad. As seen from the Wengern Alp in full front, it appears a massive mountain, but as seen edgewise it is narrow and sharp. This, it is said, may be owing to the gneiss rock, of which it is composed, splitting into immense plates. The top of the Jungfrau was long considered inaccessible. In 1811, however, the Brothers Meyer of Aarau laid claim to having reached the summit. In 1828 six peasants of Grindelwald made a successful ascent. On the 28th Aug. 1841, a party of scientific gentlemen, including MM. Forbes and Agassiz, proceeding by the glaciers of Oberaar, Viesch, and Aletsch, succeeded in gaining the top. While they were there the thermometer fell to six and a half degrees below zero. Lichens were found on the highest exposed rocks.

JUNIEN, St, a town of France, department of Haute-Vienne, and arrondissement of Rochechouart, on the right bank of the Vienne, at its confluence with the Glane, 8 miles N.E. of Rochechouart. It is built in the form of an amphitheatre, and is surrounded by boulevards, planted with trees, and commanding pleasant prospects of the surrounding country. The inhabitants are actively engaged in the manufacture of serge, blankets, gloves, hats, woollen cloths, leather, and earthenware. Pop. 5500.

JUNIPER. The juniper tree belongs to the natural order *Conifera*, and is useful, both for its wood and its berries. The Virginian species, which is called *red cedar*, affords a light and durable material valuable in ship-building. It attains the height of about 30 feet, and grows well in barren soil. The berries used for flavouring gin are obtained from the *Juniperus communis*, and about 200 tons of them are annually imported to this country. They are also used for imparting pungency to beer. When roasted and ground, they afford a substitute for coffee. The oil of juniper is an important ingredient in varnish for pictures, wood-work, &c. The berries have also a diuretic property, and are used in medicine. The heavy duty to which they were subject was abolished in 1845. See BOTANY; nat. ord. 220, *Conifera*.

JUNIUS, FRANCISCUS, an eminent scholar and philologist of the seventeenth century, was born at Heidelberg in 1589. His father, whose name was also Franciscus, was a Protestant minister at Leyden, and a professor in the university of that city. He had made himself a considerable name by the Latin translation of the Scriptures, which he had written with the assistance of Tremellius, and which is still favourably known under the name of its conjoint authors. After his death in 1603, his son, abandoning study, followed the military profession, till the truce of 1609 put an end to his hopes of preferment in that career. During the next ten years, he devoted himself solely to study and literary pursuits. Passing over to England in 1620, he became librarian to Thomas Howard, earl of Arundel, one of the best of the many good men who have borne that title. During the thirty years in which he held that office he amassed vast treasures of antiquarian, and especially of philological lore. His attention had early been drawn to the languages of northern Europe, more especially to the Gothic. This tongue is now universally allowed to belong to the great Teutonic family. A dialect of it was, at a very remote period, spoken in Scandinavia, and another at a still

Junius
||
Juno.

more distant epoch, in Moesia and Thrace. For the benefit of the Goths inhabiting these two latter countries, their bishop, Ulphilas, had translated the historical part of the New Testament. His MS. was discovered in the library of the abbey of Werden in Westphalia, and is now preserved at Upsala in Sweden. It is written on vellum leaves of various hues, violet being the predominant colour. The letters are an adaptation of the capitals of the Greek and Latin alphabets, and are all of silver except the initials, which are of gold. Junius did a real service to letters when, in 1665, he published a facsimile of this "codex argenteus," or silver book, by far the most precious relic of the Gothic tongue, and illustrated it with many learned and valuable notes. As early as 1637, Junius had made his name known by his useful essay, in three books, *De Pictura Veterum*. Of this work, he himself published an English version in the following year. But the most useful of all his writings, and one which has been largely turned to account by all English lexicographers, is his *Etymologicum Anglicanum*, in which he evolves the Saxon element of the English tongue with great acuteness and learning. When on a visit to Germany in 1650, he learned that a curious dialect was spoken in some parts of Friesland. Two years' residence and study on the spot satisfied him that the language in question was identical with the Saxon, and proved of great advantage to him in his collateral researches. In 1674 he returned to England, and spent his remaining years at Oxford. He died in 1678 at Windsor, where he had gone to visit his nephew, the illustrious scholar, Isaac Vossius. His valuable collection of MS. he bequeathed to the Bodleian library at Oxford, and the grateful university erected a handsome monument to his memory.

JUNIUS, LETTERS OF. See FRANCIS, *Sir Philip*.

JUNKSEYLO or SALANG, an island of Siam, on the W. coast of the Malay peninsula, and separated from it by a narrow channel about a mile in width, and nearly dry at low water. The island is about 25 miles in length, by 10 miles in breadth, and has at its northern extremity a harbour called Popra, which may be entered over a mud bar during the spring tides by ships drawing 20 feet of water. The anchorage round the island is generally good, with a mud bottom. Previous to the settlement of Prince of Wales' Island, it carried on a considerable trade. It has valuable tin mines which formerly yielded an average of 500 tons annually, but several of the richest mines are said to be now nearly exhausted. Pop. about 6000. N. Lat. 8., E. Long. 98. 30.

JUNO, a Roman divinity, corresponding in most of her attributes to the Here of the Greeks. She was the daughter of Saturn and Rhea, the sister and wife of Jupiter, the queen of heaven; and, as the only married goddess among the Olympians, the especial protectress of marriage and married women. Many places of Greece contested the honour of having given her birth, especially Argos and Samos, which long remained the principal seats of her worship. Though the Samian temple of the goddess was the largest and most splendid, Argos seems to have been the cradle of her worship, which at a very remote period spread through the Peloponnesus, and thence into all the adjoining countries. In Greek sculptures and reliefs Juno is generally represented in a splendid *stola*, sometimes sitting or standing in a light car drawn by peacocks, and attended by the Auræ or air-nymphs, or by Iris, the goddess of the rainbow. At Rome she was worshipped under the titles of *Pronuba*, as the goddess of marriage; *Matrona*, as the goddess of married women; *Lucina*, as presiding over child-birth; *Moneta*, as the warner, in which capacity she had a temple on the capitol on the site of Manlius' house. In this temple the mint was afterwards established. Her other titles were very numerous, but they all had reference to some of the qualities indicated in those already mentioned. The great

Jupiter
||
Jura.

annual festival in her honour, in which all the married women of Rome took part, was called Matronalia, and was celebrated on the first day of March.

JUPITER, the great deity of the Romans, whose attributes corresponded almost exactly with those of the Greek Zeus. The etymology of the word, which is a corruption of Jovis-pater, Dies-piter, or Diu-piter, fixes down its meaning as father of day, or light, or air, and points out Jupiter as having been originally the god of the elements and the controller of the operations of the upper air such as the thunder, rain, snow, &c. Hence in the classics the word is very often used to denote the open air. The root of the word occurs in the kindred languages—Sanscr. *deva*, Greek *θεός*, Latin *deus* and *divus*—which are all nearly allied to Zeus or Ju-piter. In Greek and Latin the oblique cases, Jovis, Jovi, Jovem, are exactly identical with Διός, Δι, Δία, by the same change of letters as in ζυγόν, *jugum*, and *dies*, *diurnus*, *giorno*, *jour*.

In the old mythology there were three deities known under the name of Jupiter. Of these the most celebrated was the son of Cronos and Rhea. He was born in Crete, and his mother's care saved him from his father's cruelty at his birth. When he grew up he dethroned his father, and divided his kingdom, reserving to himself the upper world of air and earth, and assigning to Neptune the sea, and to Pluto the nether world. The deposed monarch called in the Titans to his aid, but though they made head for a time against the usurper, they were finally overthrown and destroyed. His throne established, Jupiter reigned in heaven and earth with irresistible authority and infinite wisdom. Of his wives the most famous was Juno, by whom he had Mars and Vulcan. His marriage, his loves, and his quarrels were among the commonest themes of the old mythology. His worship was widely diffused throughout Greece and Italy. The most famous of his temples was that on the Capitoline Hill of Rome, where he was worshipped under the title of Jupiter Optimus Maximus. On ancient coins and sculptures the father of gods and men was commonly represented as seated on a throne of ivory, grasping in his right hand a sheaf of thunderbolts, and in his left a sceptre. His favourite bird, the eagle, stands on the right side of the throne.

JURA, an island on the W. coast of Scotland, one of the inner Hebrides, 5 miles W. of the Mull of Cantire, between N. Lat. 55.52. and 56. 9., and W. Long. 5. 43. and 6. 8. It is bounded N. by the Gulf of Corrievecan, E. by Jura Sound, S. and S.W. by Islay Sound, and W. by the Atlantic Ocean. The island is 23 miles in length from N.E. to S.W., by 6 miles in average breadth, and contains an area of about 156 square miles. A chain of rugged hills traverses its whole extent, interrupted only by Tarbert Loch, an arm of the sea, which stretches into the island for about 6 miles, nearly separating it into two parts. Jura differs much in aspect from its sister isle, Islay, although belonging to the same geological formation. The soil is inferior and the minerals unimportant. Some good slate is quarried, and a very fine sand found on the western shore is used for making glass. Bere, oats, turnips, and potatoes form the chief crops, the first being raised for the distilleries here and in Islay. Jura belongs to the parish of Jura and Colonsay. In 1851 there were 200 inhabited houses, and a population of 1064. See HEBRIDES.

JURA, an eastern frontier department of France, formerly a part of the province of Franche-Comte, lying between N. Lat. 46. 16. and 47. 19., and E. Long. 5. 16. and 6. 11. It is bounded N. by the department of Haute-Saône, N.E. by that of Doubs, E. by Switzerland, S. by the department of Ain, W. by that of Saône-et-Loire, and N.W. by that of Côte d'Or. It is 114 miles in length from N. to S., and 40 miles broad, containing an area of 1928 square miles. The surface of the country is for the most part irregular, traversed

Jura
Mountains.

as it is by the Jura Alps, from which it takes its name. This mountain range enters the department from Switzerland, and runs in a southerly direction, attaining at some places an elevation of 4000 to 6000 feet. The eastern portion of Jura is the most elevated, the western for a considerable extent is level, while the middle districts form a series of table-lands. The climate is variable according to the contour of the country. In the higher regions it is cold and tempestuous in the winter, and humid during the warmer months. The chief rivers are—the Ain, Doubs, Seille, and Oignon, the latter forming the northern boundary of the department. They are navigable only for small barges. The soil is various. In the level parts to the W. it is a marly clay which is very productive, while in the highlands it is calcareous, thin, and stony. The products are similar to those of the neighbouring departments, including wheat, rye, maize, hemp, wine, and fruit, besides butter and cheese. Cattle and sheep in large numbers are fed on the hill sides, and on the extensive plateaux. Of 1,234,097 acres contained in the department of Jura, 452,498 are arable, 359,286 under wood, 195,242 moors and heaths, 124,907 acres under grass, 51,959 under vines, 29,662 roads, buildings, &c., 13,623 rivers, lakes, canals, &c., and 6920 in gardens and nurseries. Agriculture generally is progressing. The number of wolves and foxes which come from the mountains in winter do considerable damage, especially to the flocks, which require to be tended with great care and kept in strong and high folds. In Jura manufacture is mostly confined to the nicer articles of workmanship, as the making of clocks and watches, and the turning of wood, ivory, bone, and horn. The coarser manufactures include paper, linen, wool, leather, tiles, chemicals, and hardware. The corn grown here is sufficient for the wants of the inhabitants, without having recourse to importation.

The following are the political divisions and population of the department:—

Arrondissements.	Cantons.	Communes.	Pop. 1851.
Lons-le-Saulnier.....	11	212	108,214
Poligny.....	7	152	78,311
Dôle.....	9	138	75,350
Saint-Claude.....	5	82	51,486
Total	32	584	313,361

The principal towns are Lons-le-Saulnier, the capital, (with 9400 inhabitants), Dôle, Poligny, and Saint-Claude.

JURA MOUNTAINS (Ger. *Leberberg*, Fr. *Jorat*), a chain in the S.W. of Switzerland, extending from the canton of Schaffhausen S.S.W. to Savoy. The curve which it forms is about 200 miles long, its breadth being about 30 miles. The Jura chain strikes through Soleure, Berne, and Neuchâtel, parallel to the great range of the Bernese Oberland, and forms the frontier between the Canton de Vaud, and the French department of Jura. The N.W. portion of the range is low; further to the S.W. it is precipitous on the Swiss side; and on the French side it gradually retires in ridges, which successively become lower. Some of the highest points of the range are as follows:—

	Feet.		Feet.
Mont Molesson.....	6577	Dôle.....	5510
Reulet de Thoiry.....	5627	Mont Chasseral.....	5410
Grand Colombier.....	5567	Mont Chasseron.....	5400
Mont Tendre.....	5521		

The following are some of the passes:—Fort Ecluse, close under Mont Vouache; Col de Villeneuve, S. of Grand Colombier; Marchairu, S.W. of Mont Tendre; Echelle, S.W. of Mont d'Or; Verrieres, near Pontarlier; Pierre Pertuis, an immense archway cut through the rock in the Valley of St Imier as early as the time of the Romans;

Jurieu.

and the Klus Pass in Ballsthal, important as a military station in time of war. The chief roads by which the range is crossed are from Nyon into France, over St Cergue; from Orbe, Yverdon, and Neuchâtel, to Pontarlier—the latter of these being by the picturesque Motiers Travers; also from Neuchâtel to Morteau in France; from Biel to Porrentruy; two from Basle to the interior of Switzerland, viz., the Upper and Under Hauenstein; over Stafellegg, between Frickthal and Aarau; over Bötzbegg between Basle and Zurich, an old road which existed in the time of the Romans.

Geologically the Jura chain is a limestone formation, varying between grey and yellow in colour. (For the Jurassic formation, see MINERALOGICAL SCIENCE.) The strata are tilted up sometimes almost perpendicularly, and contain stalactite caverns usual in limestone districts. The more remarkable of these grottoes are in the valleys of Verrieres, Travers, Orbe, and Frick. Beds of marl and clay are found alternating with the limestone. Marble, asphalt and gypsums are also found; iron and coal never in such abundance as to form an important source of wealth. The iron mines have as yet been turned to account only by the French. The same remark applies to the rich salt springs of Salins, Montmorot, Courbauson, Tormont, Grosion, and in the neighbourhood of Poligny, which occur in the chain. The fossils consist of the bones of large Saurians, Didelphis, crabs, shells, ammonites, zoophytes, coral, wood, &c. The trees which at present grow on the range are mainly pine and box. The former are found in large quantities near Poligny, and afford materials to the French for ships of war. The forests of ash, lime, beech, &c., also afford an abundant supply of wood for the iron-foundries and salt works of Arc, Salins, &c. During the rigour of winter the inhabitants occupy their time in cutting all sorts of fancy articles of wood, from which they derive considerable revenue. Wolves are numerous; and the brown bear, at one time so destructive to herds, is still found in the more secluded parts of the Western Jura.

The pastures are covered with the herds which supply the Gruyere cheese. The meadows are so well watered by nature and art that they yield three crops a-year; vineyards occur in the valleys. There are no glaciers, and snow lies only in the sheltered ravines. A remarkable phenomenon, occurring all along the Swiss side of the Jura, is the existence of large detached blocks of granite and gneiss, the chain itself consisting of limestone. The largest of these blocks is the Pierre-a-bot (toad-stone), upwards of 60 feet long. It is about 2 miles above Neuchâtel, and the nearest rock of the same kind is found at Great St Bernard. In the same way protogine blocks occur near Geneva, which must have come from Mont Blanc; while towards the N.W. extremity of the range others occur, which must have come from the direction of the Grimsel. It has been supposed, accordingly, that these masses were borne by huge glaciers along the Arve, the Rhone, and the Aare, across the plain of Switzerland, and thus deposited in the places in which they now stand.

JURIEU, PIERRE, a French Protestant divine of considerable note in his day as a controversialist, was born in 1637 at Mer in Orléanais. Trained at the academy of Saumur, he was sent to Holland, and afterwards to England to finish his studies. Returning home, he was appointed to the living which his father had held at Mer, and was afterwards promoted to the professorship of Hebrew and Divinity in the Academy of Sédan. In 1681 that seat of learning was suppressed; and Jurieu, who had made himself obnoxious to government by a satirical pamphlet against the established clergy, retired to Rotterdam, where he became pastor of the Walloon church. Persecution and exile soured his temper, and the remainder of his life was made up of quarrels and controversies with men of his own or

Jury Trial. the opposite party. At the very moment that he was attacking Beauval, Basnage, and Saurin, he was constituting himself umpire between Bossuet and Fénelon, both of whom he insulted with an audacity little short of insane. When his friends Bayle and Jacquelin interfered to moderate a little the fury of his wrath, he labelled and ridiculed them as if they had been his bitter foes. The Catholic controversialists of the day used to call him in irony the Goliath of Protestantism. Though he is now chiefly remembered for his quarrels, Jurieu was a man of real learning and ability; but all his good qualities were stultified by the bad temper, fanaticism, and occasional insanity that marked alike his writings and his conduct. His works, with the exception of his *Treatise on Devotion*, are all controversial, and have long since passed into oblivion. Jurieu died at Rotterdam in 1713, in the seventy-sixth year of his age.

JURY TRIAL, the most thoroughly expressive feature in the administration of British justice, is, in its essential principle, nothing more than the citizen's right to have the judgment of an impartial committee of his fellow-citizens on any question of fact tending to affect his life, his liberty, or some important patrimonial interest. The origin of the practice has been traced by juridical antiquaries into many and far diverging sources, but they have all been found converging in one direction, by the influence of a common determination, which seems to have ever guided the purpose of the Anglo-Saxons and some other northern races, in the practical application of such existing institutions as could be influenced to the end in view. Guided by a suspicion that the interests of free men could not be entirely confided either to their political rulers or to trained officers of the law, the end they had thus ever before them was to obtain the judgment of a fairly selected body of their equals to decide those simple questions of fact, which all men of sense and perception can better decide according to the rules of every-day life which guide their own actions, than the best trained philosopher or lawyer can by the application of abstract principles or traditional practices. Thus, the jury has been identified with the compurgators of the Saxons; with the inquisitors or assessors who investigated and certified to the Norman lord the extent of his feudal rights; with the peers who represented the interests of the vassals in the court of the feudal seigneur, as parliament represented the interests of the tenants of the crown; with the *judices* of the Romans, and with the *dicasts* of the Greeks. Perhaps the practice of jury trial has drawn something from all of these sources except the last; and we may even see their divergencies typified at the present day. Thus the necessary unanimity of the English jury is supposed, not without reason, to be a relic of the accused Saxon's privilege to clear himself by the oaths of twelve compurgators who believed him guiltless, while the Scottish verdict by a majority bears the character of the old feudal court of peers, where each member gave his council and his vote. However humiliating it may be to trace the "palladium of our liberties" to such a source, yet there is no resisting the evidence, that the practice which had most concern in the formation of jury trial was that compurgation which was one of the ordeals on which men threw their cause, influenced in some instances by superstition, in others by a propensity for gambling, in many by a reliance on their own audacity and discretion, but in none by an expectation that justice would be impartially administered through mere human wisdom. The ordeal of battle lived so long in the theory of English law, as to have been absolutely claimed so lately as the year 1817, as a remedy against the abuse of its rival ordeal, trial by jury. Down to that time, the process called an Appeal in murder enabled the relations of a person said to be murdered to appeal from the acquittal of a jury to another jury, whose verdict, if it condemned the accused, could not, like ordinary verdicts of guilty, be obviated by the royal preroga-

tive of mercy. On this, the last reference to a jury by appeal **Jury Trial** of murder, the accused offered the other ordeal of battle, and the legislature had to deal with, and abolish both these remnants of barbaric practice. (See **APPEAL**.) Nine hundred years earlier—in the tenth century—the northern sagas afford evidence of an almost identical competition of ordeals. Thus, a report, as it may be termed, relative to a litigation by Egil Skallagrimson, is thus translated by a Norse scholar: "When Atli entered the court with the jurors, Egil met him, saying that he had no mind to receive the oath of a jury for his money. The law which I offer, he said, is different; we shall fight a duel here in court, and let the money be his who gains the victory. What Egil said was indeed law, and an ancient custom, for every man had a right to challenge another, whether he was a defender or prosecutor in a cause. Atli said that he would not refuse Egil's challenge. You speak, said he, what I ought to speak. Then Atli and Egil shook hands, mutually ratifying their agreement to fight. He who gained the victory was to have the estates about which they contended" (Egil's Saga; *Repp on Ancient Juries*, 10).

There was still a third class of ordeals, which was essentially the ordeal by miraculous intervention. It is exemplified in the well-known ceremony of walking blindfold on a path where red-hot ploughshares were laid down at intervals. The origin of this ordeal is attributed to the legend of Bishop Boppo, who, when engaged in the conversion to Christianity of the obstinate Jutlanders, was quite unsuccessful, until he tested the truth of his faith by putting his hand in a red-hot iron glove, and withdrawing it unhurt. Such a form of ordeal naturally fell into the hands of the priesthood, who would constitute themselves the agents of miraculous intervention, and it became unpopular among the lay opponents of spiritual supremacy. The ordeal by combat, too, held out more hope to those who wielded force or policy than to those who sought abstract justice; and it at last diverged through the institutions of chivalry to the single combats of later times. The duel so peculiar to the manners of Europe in the present, or perhaps it should more properly be said in the previous generation, was, with its special ceremonies and obligations, the natural descendant of the ordeal by battle. The ordeal by compurgation had much to recommend it in preference to the others among a people eminent for their common sense and their attachment to justice. It adjusted itself to the system of frank-pledge, or common liability. If the person who committed a depredation was not discovered the neighbours were responsible for it. What then more just than to admit the innocence of him who could get a sufficient number of those neighbours to express their belief in it?

In the laws of Alfred, to whom trial by jury, along with many other national institutions, is popularly attributed, the system of compurgation is briefly described thus:—"If any one accuse a king's thane of homicide, if he dare to purge himself, let him do it along with twelve king's thanes. If any one accuse a thane of less rank than a king's thane, let him purge himself, along with eleven of his equals, and one king's thane." Hallam justly warns us not to be misled by the number twelve in identifying the Saxon practice with proper jury trial. From whatever cause it may have happened, this number seems to have been consecrated by the northern nations to numerous collective functions. By the treaty of Ethelred III. certain disputes between Welsh and English were adjusted by a standing committee of twelve men, six of them Saxon and six Welsh. By a law of the same prince, a committee of twelve thanes sat as assessors to the sheriff. Many forms of inquest were held through twelve men. When the throne of Norway became vacant, twelve men from each of the great provinces were selected to undertake the responsible duty of appoint-

Jury Trial. ing a successor; and it is said that the humble ceremony of the return of the constable in the court-leet of an English manor, was the last representative of this method of delegated selection.

No one of these is to be counted the sole origin of jury trial; nor can it be exclusively traced to the feudal practice of the assembling of the chief vassals or *pares curiæ*, to assist the feudal lord with their council. But with that peculiar facility for turning to improved practical account ancient institutions with the least possible change either in their name or their character, through which the British constitution has developed itself, the jury system grew to maturity by absorbing into itself more or less vitality from nearly all these elements. An institution very like it in external character has been found in the customs of Normandy, and was prevalent in several of the French provinces. The English institutions were thus so far impregnated with the Norman character after the conquest, that some antiquaries have held jury trial to be an institution of entirely Norman extraction. In *Magna Charta*, and the other confirmations of liberties by the early kings, it is provided that "no freeman shall be taken or imprisoned, or be disseized of his freehold or liberties or free customs, or be outlawed or exiled, or any otherwise destroyed; nor will we pass upon him, or condemn him, but by lawful judgment of his peers, or by the law of the land." By the more rigid juridical antiquaries it has been called a mistake in Blackstone and other popular writers, to suppose this passage to refer to trial by jury, since it speaks of a separate practice common to England with other feudal countries—the inquisition by peers;—but it was one of the systems out of which the modern practice of jury trial was moulded, and was, in fact, the form in which it existed through a considerable period of the twelfth and thirteenth centuries.

In all their shapes and characters it must be kept in view that the early jurors were rather witnesses than judges. They did not sit to receive the testimony of others, but they communicated the resolution adopted on the ground of their own knowledge. This feature is the more remarkable, as one of the great objects in the theory of modern jury trial is to obtain the decision of persons whose judgments are unwarpd by previous acquaintance with the matter at issue, or the statements of the parties in dispute. The obsolete principle is still represented in the term verdict, *vere dictum* (truly said), as applied to the decision of a jury. In Scotland there is a still more palpable relic of the principle, in the oath put to a jury, which is to the effect, that the juror shall "the truth tell, and no truth conceal," in passing on the assize. The Scottish jury was feudal in its institution, having probably been directly imported from France, and its character as a testifying, rather than an adjudging body, lasted down to a comparatively late period. For instance, in the year 1606, Maxwell of Gribtoun, and his followers, were charged with a murderous attack on his relations, with whom he disputed the possession of the family estates. Among other outrages the offenders laid siege to the tower or keep of Newbie, the family seat and stronghold; and altogether the affair was one of those savage feuds in which all the neighbours were deeply embarked on one side or the other, and any such thing as impartial testimony was out of the question. The Privy Council, which frequently acted as a court of justice, endeavoured to deal with the case, but were impeded by the total want of testimony, and it was brought into the Court of Justiciary on the principle that, as that tribunal had the services of a jury, testimony was unnecessary for its guidance. The Lord-Advocate represented that crimes are often committed secretly, and in such manner that no witnesses can be cognizant of them, and therefore it is that crimes need not be proved by witnesses, but are referred

to the knowledge of a sworn assize, whose determination, according as they are persuaded in their conscience, is a sufficient warrant to themselves, and a just cause of conviction. The notoriety of the offence was all the material offered for the guidance of the jury; and they were told the singular rule of law, that, with this notoriety before them, if they could not conscientiously cleanse or absolve, they must of necessity convict, and they did so. (Pitcairn's *Criminal Trials*, ii., 266.) In the trial of James Scrimgeur for murder in the year 1619, a stand appears to have been taken by the crown lawyers against the admission of witnesses to contradict the accusation, and influence the minds of the jury. "Thair aucht," said the prosecutor, "na witnesses be ressaut befor the assyse, seing the hail poyntis consists *in facto*, and the tryell thair of is remittet to the assyse, quha becumis bayth tryeris and witnesses thairin" (*Ibid.* iii., 470). It used at the same period to be customary to put juries on trial for "wilful error," or a finding contrary to what they knew to be the truth, and the analogy of the character and functions of the jury was carried out in the punishment of such error, which was the same as the punishment for perjury.

The practice of punishing juries for improper verdicts was known also in England, but it disappeared at an early period; and nearly a century before the date of the instances cited from Scottish practice, the jury in England had acquired the function expressed in the obligation of their oath, to "give a true verdict according to the evidence." Although no longer the neighbours of the party concerned, acting on their own personal knowledge of the state of facts, yet, as representing "the country," a jury was looked upon as the jealous protectors of the innocence of their fellow-countrymen. Hence it seems to have been held unfair to arraign a foreigner before a jury entirely consisting of Englishmen, and the jury *de medietate lingue*, of which one half were aliens, was early conceded to the trial of foreigners, and has been a permanent feature of the English administration of justice.

Trial by jury became a peculiar instrument of the common law courts. In the courts of civil or ecclesiastical origin, the method of inquiry was by commission; but the inquisitorial secrecy in which this process was supposed to be involved has always rendered it unpopular; and in equity proceedings it became the practice to take the aid of the common law courts, and send disputed matters of fact to be decided by juries on issues. The staple questions on which juries decide in England are, in the first place, all the heavier offences, and, in the second place, disputed matters of fact in litigations before the common law courts. In these it came to be the form, that when issue was joined by the simple and distinct announcement, "And this the said A prays may be inquired of by the country;" or, "And of this he puts himself upon the country, and the said B does the like;" that the court, by the appropriate writs, caused to be summoned on such a day "twelve free and lawful men, who are of kin neither to the foresaid A nor the foresaid B, to recognize the issue of the truth between the said parties." Before an indictment for a crime comes before the real working jury, it is still customary for the grand jury "to find a true bill;" but this preliminary, which was formerly one of the solid barriers against oppression, has become little better than a ceremony. Antecedent to the grand jury, in cases of violent death, is the coroner's inquest, which has become a somewhat clumsy means of achieving the very desirable object of preserving a certified official record of all the circumstances connected with the discovery of a dead body, or the occurrence of a violent death. Thus, a person tried for murder in England or Ireland passes three times through the ordeal of a jury. The function of juries has in all parts of the United Kingdom been considerably extended by the pro-

Jury Trial. gress of railways and other public works; the property taken from private owners, under the parliamentary powers, being in disputed cases valued by a jury.

It is natural that the adjustment of the boundary between the function of the jury to ascertain the fact, and that of the court to apply the law, should have been subject to much jealous contention. If the rules of law prevented the jury from getting access to a knowledge of the facts, or failed to give effect to their finding, the efficacy of jury trial as a protection to public justice was annihilated. On the other hand, if juries got beyond their proper function, the law of the land would become as mutable as the opinions of every casual assemblage. The law has always assumed the prerogative of dictating what is to be evidence; and as it could not, in all cases, keep the jury from being influenced by that which it declared not to be evidence, the clumsy expedient of new trials on account of verdicts contrary to the evidence was adopted. In Scotland, in the reign of Charles II., the courts endeavoured, in criminal cases, to take out of the hands of the jury the plain question of "guilty" or "not guilty," by settling beforehand a train of facts whence guilt might be presumed, and requiring the jury to find whether these facts were or were not established. It was not until the trial of Carnegie of Finhaven for the murder of Lord Strathmore in 1728, that they re-established their privilege to give a general finding of guilty or not guilty.

The class of persons of whom juries are to consist has varied at different periods, and the specific qualification of the jurymen is at present peculiar to each of the United Kingdoms. The function has always been deemed a burden rather than a privilege; and several classes of citizens have obtained exemption from it, more by their influence than by their unfitness to perform the jurymen's functions. It has always been a popular belief that butchers, from their supposed callousness to suffering, are excluded from juries; but there is no such law.

The qualifications of ordinary jurymen in England, as fixed by the Act of 1825 (6th Geo. IV., c. 50), may be taken as a type of the class who now serve as jurymen throughout the United Kingdom. Every man between the ages of twenty-one and sixty, who has no special exemption to plead, is liable to serve, if he possess landed property under any of the ordinary tenures, which are specifically enumerated in the Act, worth L.10 a-year; or who is a leaseholder for twenty-one years, or life, of land worth L.20; or who is rated as a householder for poor-rates or inhabited house-duty, at L.30 in Middlesex, or L.20 elsewhere; or who occupies a house containing not fewer than fifteen windows.

There are very complex arrangements throughout the empire for preserving, through the aid of the parochial and other petty officers, an accurate and impartial record of jurors. There is a double object to be served in the accurate impartiality of the lists,—the one to save qualified jurymen from the oppression of too frequent service; the other to disable persons interested from "packing" a jury, or placing men upon it who will serve their object. The panel of jurors—or the whole body out of whom the twelve who are to act are selected by lot—is returned by the sheriff according to an established rotation. The Act of 1825 rendered it unnecessary to summon a separate panel for each cause to be tried at an assizes, and appointed one panel, of not less than forty-eight, or more than seventy-two, jurors to be summoned. The Act authorizes two panels, one for the civil, and one for the criminal work of the assizes. The right of challenge is one of the arrangements for securing an impartial trial. The suitor may challenge the array, as it is termed, or the whole jury, if there be any fundamental blemish in its constitution; or he may bring against any particular jurymen a challenge, per poll, on disqualification, personal interest, or other similar

objection. A person under trial for a capital offence has the privilege of objection to one jurymen after another, to the number of thirty-five, by peremptory challenge, without assigning any cause. Questions may, on special application, be tried by what are called "special juries." The special jury list consists of those who are entered as esquires; and the privilege of resorting to such a jury has generally been used in cases where the nature of the litigation rendered it of moment that a verdict should come from persons skilled in the matter in dispute. The arrangements for adjudication by special juries were adjusted in the Common Law Procedure Act of 1852.

It has already been seen that in the development of the jury system Scotland did not follow the same course as England; but the general spirit of the English system has had an influence over the tendency of its neighbour. In Scotland there is no coroner's inquest. In ordinary criminal prosecutions there is no grand jury, and the ordinary jury or assize, consisting of fifteen, give their verdict by a simple majority. In questions of treason the English system was, much to the discontent of the country, introduced immediately after the Union. Jury trial in civil cases was inconsistent with the traditional spirit of the Scottish legal tribunals. The Court of Session, consisting, like the penal jury, of 15 members, represented the old judicial committees of parliament, or the grand jury of the nation. Their method of procedure had, down to a very late period, several elements of a popularly deliberative character, distinguishing them in an emphatic manner from the rigid legal technicalities of the English common law courts. In the year 1815 it was determined that the English system of jury trial should be brought into Scotland, and a separate court of commissioners was appointed to carry it into effect. In 1830, after what was deemed a sufficient trial of the system in this separate form, it was made a portion of the ordinary jurisdiction and procedure of the Court of Session. Trial by jury in civil questions has not been popular in Scotland; and whatever good it may have accomplished has certainly been balanced by much costliness, uncertainty, and tedious protraction of litigation. The English system of pleading has, through a long course of refining, brought itself to that simplicity of assertion and denial which at once opens the issues on which a jury have to decide. But the Scottish system of pleading was formed for the purpose of reaching results in a different manner. It was predicted by law reformers, that what in England offers the means of a rapid and distinct decision on the point in dispute, would in Scotland merely add an element of prolixity and confusion to a method of procedure already too cumbrous; and the prediction has, at least in popular estimation, been verified. It is a common remark, that the threat of a jury trial is one calculated at once to enable a rich man to frighten his opponent into submission. A people not trained to a traditional veneration for every feature of the system, could not see a logical conformity in making twelve men swear that they would do justice according to their consciences, and then coercing them by confinement and starvation until they had agreed to be all of one mind. In 1854 the stringency of the rule of unanimity was accordingly relaxed by a provision that, after six hours' deliberation, a verdict returned by nine of the twelve jurymen should be effectual (17th and 18th Vict., cap. 59). Some attempts were made, but in vain, to introduce this arrangement in England.

In estimating the general merits of the jury system, its inapplicability to communities not trained to it must be counted. Like many other safeguards of freedom, it is effectual only for the protection of those who raise it for themselves. Among people trained by arbitrary governments to submit when they must, and rebel when they can, it has been found utterly futile; they cannot compre-

Jury Trial. hend any use of a power or a privilege save the serving of their own immediate objects. Even in France, where it was introduced after the Revolution in criminal questions, it has given imperfect satisfaction. It has been said that in important, and especially in popular cases, juries have been led astray by excitement; while for conducting the ordinary routine of dry business, the country does not afford sufficient public spirit. It will probably soon be seen how far juries may be effectually replanted in those Scandinavian states, whence, in their indigenous growth, they have been long uprooted.

Whether in England itself jury trial is not worshipped with a superstitious and indiscriminating reverence is a fair question. No one will deny its inestimable services in criminal trials. It is not only a protection against political oppression and the procrustean cruelty of implacable legal technicalities, but it tends to bring the method of discerning truth in questions between man and man to scientific perfection. It is quite true that there are eminent difficulties before the prosecutor who requires to bring all his evidence up at one moment, and fit together its several parts before a public audience. From the sound rule, that no man can be twice tried, any defect in the completeness or the adjustment of the evidence is fatal, and a criminal escapes. But the rigid exactness thus enforced only tends to give the evidence adduced to a jury a perfection which the method of secret inquisition does not require. There are few nobler objects than a great trial, in which the results of legal and detective skill, all brought to a focus, are exhibited before the world, bringing out, as in a drama, the unravelled intricacies of some great crime.

For civil cases, the great utility of the jury has consisted in its being a method of keeping the facts of each case absolutely separated from the law. The importance of this absolute separation can scarcely be over-estimated; and though it might seem possible that it should be accomplished in a less ceremonious manner, yet respect is due to the opinions of those who hold that the employment of men taken from the ordinary affairs of life, and restrained neither by technical rules of law nor official routine and prejudice, brings daylight into courts of justice, and enables them to walk in the proper direction of their functions to do substantial justice between man and man. It is proper, in conclusion, to mention a tentative arrangement for substituting the decisions of a judge for the verdict of a jury, when parties consent to an issue being so tried. It was introduced by an Act of 1850 regulating the procedure in Scotland, and it was transferred to England by the Common Law Procedure Act of 1854 (17th and 18th Vict., c. 125). It is said, however, that the arrangement so sanctioned has been rarely adopted. The measure for deciding small debt questions in England in county courts passed in 1846, had previously adopted a modified jury system. The number of jurors was to be five, but unless a jury was specially demanded, and the required notices sent, the function of deciding the fact as well as the law was left to the judge.

(J. H. B.)

JUSSIEU, ANTOINE LAURENT DE, the most illustrious member of a family which has given several great names to science and was long known as the *dynastie botanique* of France, was born at Lyon, April 12, 1748. At the age of seventeen he left his native town to study medicine in Paris. He took up his abode with his uncle Bernard de Jussieu, one of the lecturers on botany in the Jardin du Roi, and a man of immense scientific learning and skill. The teaching and example of this relative first gave the young student a taste for the science which he may be said in a great measure to have created, or at least re-modelled. He did not, however, wholly abandon medicine; but the thesis which he defended on taking his degree in 1770—"An Economiam Animalem inter et Vegetalem Analogia"—indicates

clearly enough the bent that his thoughts and studies had already taken. In this same year he was made professor of botany in the Jardin du Roi, in room of Lemonnier, whose duties as first physician to the king prevented him from lecturing regularly in person. This rapid and sudden promotion took him by surprise. He was only twenty-two years of age, and his knowledge was so far from being adequate to the duties of his chair, that he had to prepare carefully the evening before the prelections of the following day. His indefatigable zeal and industry soon brought him abreast of the science as then taught; and his Memoir on the family of the Ranunculaceæ procured his admission into the Academy of Sciences, and was incorporated in the *Transactions* of that body. In this memoir one sees the germs of that system of classification according to characters which he afterwards extended and applied to the whole vegetable kingdom. To illustrate the new method he could not have fixed upon a more safe or convenient order than that which he selected; and he used to say in after life that it was while engaged in preparing this memoir that he first felt himself truly a botanist. A wider field was presently opened up to him. The Jardin du Roi was at this time arranged according to the system of Tournefort. In 1774 the number of specimens had so greatly increased, that by the advice of Buffon it was determined to replant the garden. Jussieu profited by this occasion to send in to the authorities a scheme of his method, which was finally adopted. The general idea of it was undoubtedly borrowed from what was called the *Catalogue of Trianon*, which had been drawn up by his uncle Bernard. Many of the details, however, were so different, and the scheme itself was applied on such a large scale, that the credit of the whole fell to the younger Jussieu, especially as his uncle, now aged and infirm, and imbecile, had become a victim to the hereditary scourge of blindness. The new views were given to the world in a Memoir, entitled "Exposition d'un Nouvel Ordre de Plantes adopté dans la Démonstration du Jardin Royal," and embodied in the *Transactions of the Academy of Sciences* for 1774. Great as were the merits of the "Natural" system, Jussieu was himself well aware that as first evolved by him it was merely provisional. Accordingly, the next twelve years of his life, that is from 1775 to 1787, were entirely spent in testing it in his class lectures, and modifying it according to the new genera which were brought to him by travellers from every quarter of the globe. When at length, in 1778, he began to publish, so thoroughly had he matured his plan in its minutest details as well as its general outline, that he did not find it necessary to transcribe the whole work before consigning it to the press. Leaf by leaf his MS. was put in type as soon as it was written. The printing of the work lasted fifteen months, during all which time Jussieu, according to the testimony of his son, was never more than two sheets a-head of the compositors. The difficulty experienced in wringing either "copy" or "revises" out of his hands, and the elaborate care with which he corrected and often re-cast the proof-sheets, are dwelt upon by his biographers as sufficient evidence that he was really the author of his own work, and was not merely transcribing or translating into Latin his uncle's MS. notes, as was at one time alleged against him. Making due allowance for all this care, however, we are still surprised that the composition of the *Genera Plantarum* should have taken so long as it did. It only comprises some 2700 genera; and in the then state of botanical science could hardly have contained more. The botanical text-books of the present day contain from 9,000 to 10,000 genera. When at length the work appeared, it was at first very coldly received, and nowhere more so than in the author's native country. The artificial or sexual system of Linnæus had been adopted in all the schools, and had taken root so firmly that it was impossible at once to eradicate it. The

Jussieu. hurricane of revolution was likewise sweeping over France, and men were too busy with politics to spare time for deciding between rival systems of botany. In England and Germany it began, though slowly, to find favour with the learned few; and when order was at length restored in France, its merits secured its adoption as the text-book in most of the scientific schools. It was not, however, till about the year 1820 that the Jussieuan system came to be recognised and publicly taught everywhere in England and America as well as on the Continent. The leading feature of this, as of every other natural system is, that it brings together all those plants which are allied in all essential points of structure, and takes into account the true affinities of plants on a comparison of all their organs. Assuming that as the lowest species which has no cotyledon in its embryo, that as next higher in the scale which has one, and that as highest of all which has two, Jussieu divided plants into the three primary groups of *Acotyledones*, *Monocotyledones*, and *Dicotyledones*, under which he included fifteen classes. Of these classes one is Acotyledonous, three are Monocotyledonous, and eleven Dicotyledonous. The three Monocotyledonous classes are distinguished by the position of the stamens, whether inserted on the thalamus (hypogynous), attached to the calyx (perigynous), or to the ovary (epigynous). Dicotyledonous plants are divided into Apetalous (monochlamydeous)—plants having a calyx only; Monopetalous (gamopetalous)—plants having united petals; Polypetalous—plants having separate petals; and Diclinal—plants which are unisexual and incomplete: the last constitutes the fifteenth class, while the other ten classes of Dicotyledons, included in the three other divisions, are determined chiefly by the position of the stamens and the corolla in relation to the ovary. Under these classes he included 100 orders. A tabular view of Jussieu's "Natural" system is given in art. BOTANY, part ii., chap. 2.

When the Revolution broke out, Jussieu, very much against his own wishes, was drawn into its vortex. In 1790 he was made a member of the municipality of Paris, and was entrusted with the supervision of the hospitals and charities,—an office which he held for two years. In 1793, when the Jardin du Roi was re-organised as the Museum of Natural History, Jussieu succeeded Daubenton as director and treasurer, and signalized his year of office by laying the foundation of what has since become one of the best, if not actually the best scientific library in Europe. From this time till 1820 he continued to enrich the *Annales* and *Mémoires* of the museum with contributions, bearing chiefly on the orders, genera, and species of his own system. After that year the infirmities of old age and blindness disabled him from keeping abreast with the progress of the science to which he had himself given the strongest impulse. In 1826 he resigned his chair at the museum in favour of his son Adrian, to whom he transmitted the virtues as well as the talents of his family. The next ten years of his life were spent in dictating a new edition of the *Genera Plantarum*, in which all the recent discoveries were to be embodied. But his strength was not equal to the task, and he never got beyond the introduction, which, however, is itself sufficient to show that to the last he retained that union of knowledge and philosophy which places him at the head of all the botanists of France. While lingering over this last effort of his mind he was carried off after a short illness, September 17, 1836, in the eighty-ninth year of his age. Jussieu's life, long as it was, and embracing the stormiest era of French history, was a happy and a peaceful one. His temper, less austere than that of his uncle, was singularly equable; and the fierce attacks that were often levelled against him never drew from him an angry or even a harsh retort. To the last he retained undiminished the affection of his family and the respect of his friends.

JUSTICE-CLERK OF SCOTLAND. See SCOTLAND.

JUSTICE OF THE PEACE. Before the institution of this office, as it now exists, certain public functionaries in England, such as the Lord Chancellor, the Judges of the Queen's Bench, sheriffs, and coroners, were invested with powers, as they still are, for the maintenance of the public peace. Besides these there were, however, in earlier times, persons appointed to that duty by the freeholders in their county courts, under authority of the common law of England, as well as others, who were bound to discharge it by the tenure of their lands. These persons were at length superseded by justices on the accession of Edward III., who issued writs commanding each sheriff to cause the peace to be kept within his bailiwick. The statute 1st Edward III., c. 16, passed soon after, transferred the appointment of these newly created conservators of the peace to the king; and when, by 34th Edward III., c. 1, they acquired the power of trying minor offences, they received the name of Justices. Since that time the sovereign has been constitutionally recognized as the chief conservator of the peace; and commissions are granted at the royal pleasure, authorizing any one to cause it to be kept, with power to punish whoever may break it. The form of the commission was first settled in 1590; and, among the number of those included in the commission, one or more were named—popularly styled Justices of the Quorum—without whose presence the others were not entitled to act. This distinction is, however, not now kept up, and all are equally empowered to act. On their appointment they must take the oaths prescribed by law. Their services are rendered gratuitously; and hence they are usually called the unpaid, to distinguish them from stipendiary magistrates. A variety of statutes were passed between the reign of Edward III. and Henry VI., regulating the numbers, qualifications, and residences of justices in England, but these are not now of much practical importance. In order to exclude persons from the office who were unsuitable on account of their poverty, the statute 18th Henry VI., c. 11, required that each justice should have lands to the value of £20 per annum. To meet the depreciation of money, the statute 5th George II., c. 11, raised the required sum to £100 per annum, clear of all deductions, and subjected every person who acted without that qualification to a penalty of £100. This statute, and the 6th and 7th Vict., c. 73, § 33, disqualify every practising attorney, solicitor, or proctor, from acting as a justice of the peace. The 34th section of the latter of these statutes declares, that this disqualification does not extend to any town, having justices within its limits, by charter or commission. The statute 18th Geo. II., c. 20, continues the requirement, that the English county justice shall possess £100 per annum from heritage, but excepts the justices of the English burghs.

In Scotland, we find the office of justice of the peace mentioned so far back as the Act 1587. In cap. 82 of that year, the sovereign was authorized to grant commission to noblemen of all ranks, and landed gentlemen, actual indwellers in the shires, the number for each shire being limited, together with four of the council of every burgh. The following statutes were afterwards passed for the better regulation of the office:—1609, c. 7; 1617, c. 8; 1633, c. 26; 1661, c. 38. This last is worthy of perusal. An act, passed in 1686, c. 20, vested the appointment of clerk to the justices in the crown. In 1707 a new commission for Scotland was issued, conferring on justices the same powers, in reference to the customs and excise, as were exercised by justices in England; and the Act 6th Anne, c. 6, declared that justices in Scotland are "authorized to do, use, and exercise over all persons within their several bounds, whatever doth appertain to the office and trust of a justice of the peace, by virtue of the laws and acts of Parliament made in England before the Union, in relation to, and preservation of, the public peace; provided,

Justice-
Clerk of
Scotland
||
Justice of
the Peace.

Justice of
the Peace.

nevertheless, that in the sessions of the peace the methods of trial and judgment shall be according to the laws and customs of Scotland." With commissions for Scotland there are issued writs authorizing the appointed justices to be sworn; but, by 7th Geo. III., c. 9, the oaths do not require to be taken oftener than once in each reign. In Scotland no property qualification is required. When the office is conferred on sheriffs or magistrates, they cease to hold it on the termination of their office. By the 6th George IV., c. 48, § 27, it is declared that "no solicitor or procurator in any inferior court in Scotland, or the partner of any such person," shall act as a justice in any county in Scotland during the time that he is in, or connected with any such business.

The powers of justices of the peace are conferred and defined, 1st, By the terms of the royal commission in their favour; and, 2d, By the terms of a great variety of Acts of Parliament, conferring on justices the power of carrying them into effect. The leading clause of their commission runs thus,—“to keep and cause to be kept all the ordinances and statutes for the good of our peace, and for the preservation of the same, and for the quiet rule and government of our people;” and “to chastise and punish all persons that offend against” the same; and “to cause to come before you, or any one of you, all those who, to any one or more of our people concerning their bodies, or the firing of their houses, have used threats; to find sufficient security for the peace, or their good behaviour towards us and our people; and, if they shall refuse to find such security, then there in our prisons, until they shall find such security, to cause to be safely kept.” They are also empowered to grant warrant for apprehending all criminals, and for remitting them to be dealt with in higher courts, when the offence charged is one which they cannot themselves try. The Acts of Parliament which have been passed from time to time, within the last two centuries, have devolved on them an amount of business which our limits do not enable us even to specify. We may mention generally, that under special statutes they hold both criminal courts and small-debt courts, and decide in matters connected with the poor, with the highways, the excise and customs, and other revenue matters, fishings, game, factories, and public-houses. They judge also in questions between master and servant, and in cases of petty thefts and trifling assaults. They hold quarter-sessions, which they may continue and adjourn when necessary. Two justices form a quorum for trial and judgment, both in England and Scotland. One justice may, however, grant a warrant to apprehend an accused party, and bring him into court, except where any special statute requires that to be done by more than one. They never had the power, in Scotland, of trying cases with a jury like the quarter-sessions of England. They are not entitled to judge or act in any matter which affects the interests of themselves or their near relatives. No military officer can act as a justice of peace in the billeting of soldiers under the Mutiny Act; nor millers or bakers under the Bread Act; nor tradesmen in charges of violent combination against the workmen of the same trades; nor brewers, maltsters, or distillers, or dealers in exciseable commodities under the Licensing Act, or in excise questions connected with their trades.

As the office of justice is conferred by, it subsists only during the pleasure of the crown; so that the issuing of a new commission, in effect, recalls the former one, as two cannot exist for one place at one time. The commission also expires in six months after the demise of the crown. Sometimes a writ passes the Great Seal, discharging a particular justice from any longer exercising the office. The entire commission may also be suspended by a writ of *supersedeas*, and it may be revived by another writ called a *procedendo*. The office is of great public utility. It

must necessarily, however, on account of the great number of justices required, be conferred on many persons who have had no training for the discharge of its duties; and, therefore, most statutes which confer a cumulative jurisdiction, require the concurrence of two justices where one stipendiary magistrate (who must necessarily have undergone a professional training) is sufficient. Wherever a justice of peace, however, acts conscientiously and consistently with the statute which he is called on to enforce, he is protected from all personal responsibility; but if he plainly exceed the powers conferred on him by the statute, or if he act maliciously and without reasonable and probable cause, he is justly liable in damages. Malice is not required to be proved where the justice acts grossly irregularly, or plainly beyond his powers. Acting within his powers it is otherwise; but not where, in the words of Lord Corehouse, his proceedings are “extra-judicial, lawless, and oppressive.” Lord Chief-Commissioner Adam remarked, however, that, “if there was probable cause, the magistrate is protected, in whatever situation his mind may have been.” For their protection in England, see the statute 24th George II., c. 44; and both in England and Scotland, see 43d George III., c. 141, by which it is declared, that even when their judgments are quashed, the justices in actions of damages, besides the penalties levied, shall not be liable in more than two pence of damages, nor costs of suit, unless the acts complained of “were done maliciously, and without any reasonable and probable cause.” Nor are they liable in any consequences, though their judgment is quashed, where they can prove that the plaintiff was guilty of the offence of which he was convicted, and had undergone no greater punishment than the law assigns to such an offence. See also 9th George IV., c. 29, § 26; and 1st William IV., c. 37; and 11th and 12th Vict., c. 44. A calendar month’s notice must be given to the justice before the raising of the action, and it must be raised within six months after the act complained of.

JUSTICIAR, or JUSTICE-GENERAL. See SCOTLAND.

JUSTIN MARTYR, one of the fathers of the early Christian church, who flourished in the second century, was born at Flavia Neapolis, near Shechem in Samaria. The exact date of his birth is much disputed, some authorities assigning it to A.D. 89, others to A.D. 118, while others again adopt intermediate dates. He seems to have entered upon the study of philosophy with an ardent desire to arrive at the knowledge of God; but neither the system of the Stoics nor that of the Peripatetics, which he tried in succession, brought him to the knowledge for which he thirsted. The next system which he determined to study was that of the Pythagoreans, but owing to his ignorance of some of the elementary sciences, he was denied admittance to the schools where that philosophy was taught. Foiled in this resolution, he sought refuge in the doctrines of the academy. Expecting to be favoured with a sight of the Divine Being, he was, upon one occasion, walking alone by the sea-shore, when he was met by an old man who pointed out to him the errors of Plato, and advised him to turn his attention to the Jewish prophets as inspired by the Spirit of Truth. For the fifth and last time Justin changed his creed, and about the year 132 made a public profession of Christianity. The Christians, at the time when Justin joined them, were suffering greatly from the false rumours regarding their character and principles, which were industriously circulated by their enemies. One of Justin’s earliest acts was to address an *Apology* to the Emperor Antoninus in defence of his fellow-sufferers. His appeal was so far successful as to gain some little toleration for the new faith. His second *Apology*, addressed to the Emperor Marcus Aurelius was called forth by the renewed persecution of the church, but had unfortunately no other effect than that of making its author a conspicuous mark for vengeance. In both these

Justiciar

Justin
Martyr.

Justinian. *Apologies* Justin turned to such good account his knowledge of the Greek schools, that Tertullian and many of the early writers called him *The Philosopher*. About the year 165 Justin was himself called upon to seal his testimony with his blood. He might have saved his life by consenting to offer sacrifice to the heathen gods; but he refused, and his refusal was punished with death. As his life and death had been both in an eminent degree those of one bearing witness to the truth, he became known to posterity as the Martyr.

The writings of Justin are chiefly valuable as having been written at so early a period in the history of Christianity, for they display nothing approaching to genius, and are faulty in method, reasoning, and style. His most important works are the two *Apologies* already mentioned, and his *Dialogue with Trypho*, a learned Jew, in which he describes his conversion to Christianity, and defends that faith from Jewish prejudices and assaults. Many other works are attributed to him, of which that on the *Unity and Sovereignty of God* is alone accepted as genuine. Of the rest the majority are spurious, and the whole at best doubtful.

The best editions of his works are those of R. Stephanus, Paris, 1551-1571, in Greek; of Commelin, 1593, in Greek and Latin; of Prudentius Maranus, 1742; and of Otto, Jena, 1842-4, in 2 vols. 8vo, with a valuable preface and notes. The *Apologies* and the *Dialogue with Trypho* have been both translated into English; the former by William Reeve, M.A., in 1809; and the latter by Henry Brown, M.A., in 1755. A good idea of the life, times, and theology of Justin is given in Bishop Kaye's *Writings and Opinions of Justin Martyr*, Cambridge, 1829; and a still better in Semisch's two essays on that same subject, Hamburg, 1842, 1848.

JUSTINIAN I., FLAVIUS ANICIUS, surnamed *the Great*, emperor of Constantinople and Rome, was born in May A.D. 483, at Tauresium in Dardania. His parents were obscure, but his uncle, Justin I., who had risen to a high position in the court of Constantinople, took Justinian under his care, attended to his education, and resolved to further his fortunes. As Justin was without issue, Justinian wisely identified his own interests with those of his uncle, and manifested great zeal in the destruction of certain persons who were considered dangerous to the imperial safety; and as a reward for his services he was appointed commander of the forces in Asia. But he consulted his own interests better by remaining in Constantinople and ingratiating himself with the senate. In A.D. 521, that body raised him to the consulship; and as he still continued to increase in favour, the senate recommended the emperor, who was now old and infirm, to adopt his nephew into a share of the government of the empire. This was done in 527, Justinian having reached the age of forty-four. In a few months afterwards Justin died, and his nephew was crowned by the patriarch of Constantinople. The coronation was accompanied by most magnificent festivals, and vast quantities of money, amounting to 288,000 pieces of gold, were given to the populace. The new emperor persisted in having Theodora, who had been a common actress, crowned along with him as his empress. The first years of this reign were spent in repelling the inroads of the Huns and the Arabs; and an extensive war was carried on in Armenia with the Persians, which ended in an annual payment of 440,000 pieces of gold to Chosroes, the Persian king.

At this time the struggle between the *Blue* and the *Green* factions, as they were called, raged within the city; and a conflagration, kindled by them for the sake of massacre, would have cost Justinian his empire but for the courage of Theodora, who exhorted him to fight for his empire to the last extremity. See **CONSTANTINOPOLITAN HISTORY**.

The rebellion was quelled, and Justinian being established on the throne, turned his arms against surrounding enemies. His generals, Belisarius, Germanus, and Narses

fought the battles of the empire against the Vandals in Africa, the Goths in Italy and Spain, the Persians in the East, and the countless hordes of Huns, Franks, Bulgarians, Slavonians, and others who were ever ready to invade the imperial dominions when they had the least prospect of plunder. When the successes of the generals above mentioned had restored peace, the emperor turned his attention to the formation of a complete code of laws, the execution of which has conferred great lustre upon his name. (See **CIVIL LAW**.) He died in November 565, in the eighty-third year of his age, of which he had reigned 38.

The time of Justinian is a bright epoch in history; but when his character and conduct are fairly canvassed, it is found that much of the merit for ability displayed during his reign attaches to others, and much demerit to himself. The glory of the warlike operations carried on against the enemies of the empire, belongs to his faithful generals Belisarius, Germanus, Narses, and others, for Justinian himself was no warrior, nor did he ever enter a field of battle. It is true he supplied his generals with abundant means for carrying on active warfare, but it was by the most merciless rapacity exhibited towards his own subjects. They were often compelled to bring their stores for the supply of the troops without receiving adequate remuneration, and sometimes without any remuneration at all. The emperor could well afford to scatter hundreds of thousands of gold pieces amongst the people, when this money so distributed was quite certain to find its way back to his own treasury by the oppressive taxes which were imposed upon all branches of industry, and by his monopoly of the silk trade. In the same way, at the expense of his subjects, he could gratify his desire for associating his name with art, by building splendid monuments in almost every important town of his empire. Procopius has written a work, *De edificiis Justiniani*, which contains an account of these buildings; and one of them, the church of St Sophia, so impressed the emperor when he saw it in all its splendour, at its dedication, that he exclaimed in a transport of delight, that he had surpassed Solomon himself! But besides avarice his character was deformed by religious intolerance. Zealous in the cause of orthodoxy as then professed, he persecuted those who held different opinions from his own, and tried to expel them from his empire; yet he ended by becoming a Nestorian himself. Having risen to power by unscrupulous means, he was naturally suspicious; and his ungenerous treatment of Belisarius has left an indelible stain upon his memory. (See **BELISARIUS**.) Although he raised Theodora, who was a mere courtesan, to be his empress in spite of all remonstrance, yet, when he had set his heart upon Amalasuntha, the queen of Theodot, it is pretty certain that he would have sacrificed both Theodora and Theodot in order to gain the object of his desire. It is to his *Pandects*, *Institutes*, and *Novels*, that Justinian is chiefly indebted for his fame; and perhaps his merit in respect of these has been overrated. In private life he was a man of hard application, frugal, and even penurious; for though he frequently helped those who were suffering from the effects of plagues and earthquakes, yet he turned a deaf ear to the complaints of those who were suffering from the rapacity of his ministers.

JUSTINIAN II., surnamed *Rhinotmetus*, succeeded his father Constantine IV. as emperor of the East, and reigned from 685 to 695, and again from 704 to 711. His reign was signalized by his wars and truces with the Saracens and the Christian Maronites of Mount Lebanon, by the dissensions created in the church through his intolerance, the bloody persecution set on foot against the Manicheans, and the insatiable rapacity with which he taxed his subjects in order to raise the means of gratifying his sumptuous tastes. His cruelty and extortions at last maddened his subjects into rebellion. Under the command of the famous soldier Leontius, they rose *en masse*, dethroned Justinian, cut off

Justinus. his nose (from which indignity he obtained the surname of Rhinotmetus), and banished him to the Crimea. Leontius was proclaimed emperor, and after a reign of three years was in his turn dethroned and banished by Tiberius Absimarus, who wore the purple for seven years. Meanwhile, Justinian, having escaped from the Crimea, had married the daughter of Busris, the khan of the Khazars. Compelled by the intrigues of Tiberius to quit his new home, he fled to Terbelis, king of the Bulgarians. With an army of 15,000 horsemen he suddenly pounced upon Constantinople, slew his old rivals Leontius and Tiberius, with thousands of their partizans, and reinstated himself on the throne. Cruelty, rapacity, and disaster marked his second reign. Conspiracies again broke out, and Justinian, to the great joy of the whole Roman world, was at length dethroned and put to death by Philippicus Bardanes, A.D. 711.

JUSTINUS, a Latin historian, whose name appears in some MSS. as M. Junianus Justinus, and in others as Justinus Frontinus. Of his personal history absolutely nothing is known. He was at one time believed to have flourished in the reign of Antoninus Pius, as the preface of his history was addressed to that emperor. But the passage in which Antoninus' name occurs has now been proved to be spurious, and there is nothing by which to indicate this historian's era until a reference to him by St Jerome fixes it down to some point before the fifth century A.D. Justinus' name has been kept alive by his work entitled *Historiarum Philippicarum, libri xlv.*, which he himself describes as derived solely from the *Universal History* of Pompeius Trogus, a Latin writer of the Augustan age. The work of Trogus has perished, with the exception of a few fragments preserved in quotation by Pliny and others; but the *prologi*, or abstracts prefixed to each chapter, and giving a synopsis of its contents, still remain, and indicate the general tenor of the history. The work, as its title suggests, was, strictly speaking, an account of the Macedonian monarchy; but the author, imitating the example of Herodotus and Theopompus, indulges in frequent digressions, and discusses every subject, however remotely connected with the main narrative. The first book is devoted to the Assyrians from the time of Ninus to that of Sardapalus, and to the Medes and Persians to the reign of Darius Hystaspes. The next five books discuss the wars between Greece and Persia. The way is thus paved for the main theme,—the rise, progress, and decline of the Macedonian empire,—which occupies the next ten books. Then follow six books devoted to Carthage and Sicily. Sixteen books, from the twenty-fourth to the fortieth, are allotted to Greece, Egypt, and Asia, and the gradual subjugation of these countries to the Roman power. The rise of the Parthian monarchy engrosses the next two books. The forty-third is devoted to the early history of Rome and Marseilles; and the forty-fourth contains scattered notices of the Ligurians and Spaniards.

Though Justin's work is generally described and criticised as an epitome of the great history of Trogus, it is in reality nothing more than a selection from that work of such passages as struck the compiler's fancy. The general idea, however, is that Justin designed to furnish a systematic abridgement of Trogus' work, and on that understanding he has been severely censured for the careless and slovenly way in which he has performed his task. There is, indeed, great reason to regret that he has seen fit to dwell at length on trifling subjects, and to dismiss with a few words others of deep importance. At the same time it should not be forgotten that, with all its omissions, intricacies, and digressions, Justin's work contains a large mass of valuable learning, which, but for him, would never have been recorded at all. A sufficiently honest, though not very discreet compiler, he might have given a high value to his work by bestowing a little more care on the plan,

and, above all, on the chronological and geographical portions of it. His style,—very far, indeed, from being perfect,—has, nevertheless, the merit of clearness, occasionally even of elegance. There have been numerous editions of Justinus. Among the best may be mentioned those of Groëvius, Leyden, 1683; Hearne, Oxford, 1705; Gronovius, Leyden, 1719 (reprinted in the *Variorum Classics* in 1760); the Bipontine Society, 1802; Wetzel, 1806; and Froscher, Leipzig, 1827. The English translations by Codrington, 1664; Thomas Brown, 1712; Nicolas Bayley, 1732; John Clark, 1732; and Turnbull, 1746, all of which were published in London, have gone through several editions.

JUSTINUS I., Emperor of the East, A.D. 518-527, was a native of Tauresium, in Dardania, who, discontented with his humble lot as a shepherd, set off to Constantinople to seek his fortunes in the capital. Enlisting in the guards of the Emperor Leo, he greatly distinguished himself in his and the two following reigns, and attained successively the rank of tribune, comes, senator, and finally commander-in-chief of the troops which, some years before, he had joined as a private. On the death of Anastasius, in 518, he was raised to the purple by the army, being then in his sixty-eighth year. He was brave, and fond of war; and clergy and people both ratified the choice of the troops. Though he could neither read nor write, and was wholly unskilled in civil affairs, he was always able to preserve order throughout his vast empire, and to select the best men to the special offices of state. He made over the civil administration to the quæstor Proclus, a faithful and able officer, whose policy gave equal satisfaction to the emperor and his subjects. Himself an orthodox churchman, he brought about a reconciliation between the Eastern and Western Churches in 520, which was maintained for a considerable time undisturbed. In that same year he adopted his nephew, the famous Justinian, with whom from this time he shared the cares of state. It was at his nephew's instigation that Justin caused the Goth Vitalianus to be assassinated. This turbulent and unruly spirit had recently been raised to the consulate, and his conduct in that office had roused the jealousy and suspicion of the court. Justin invited him to a sumptuous banquet, and there caused him treacherously to be murdered in presence of himself and Justinian. This cruel act throws a dark stain on the characters both of uncle and nephew, and led to fierce contests between the green faction, by which Vitalian had been beloved, and the blue faction, which enjoyed the favour of the emperor. In 522 a war broke out with Persia, which continued for several years, without any decisive result. It was in this war that Belisarius first gave proof of his military genius. Justin died in 527, soon after having conferred the dignity of Augustus on his illustrious nephew. Though rude, illiterate, and warlike in his tastes, Justin was a wise and successful ruler. He was perfectly honest, a sincere well-wisher of his subjects, and ever ready to promote their best interests. His insight into human character was both deep and sound, and to his tact in singling out and promoting men of talent was due much of the happiness and success of his reign.

JUSTINUS II., Emperor of the East, from A.D. 565 to 578, was the nephew of the great Justinian, and immediately after his uncle's death in 565 was raised to the throne by the senate and the army. The opening of his reign augured well for the future. He paid the debts of his predecessor, distributed large sums of money among the poor, published an edict of universal toleration for religious belief, recalled many persons who had been banished for heresy, and restored peace to the church. As soon as he was fairly seated on the throne, however, his real character began to show itself. His rapacity, cruelty, and pride raised a host of enemies against him, abroad as well as at home. One of his victims was the famous eunuch Narses, the exarch of

Juvenalis.

Ravenna, and the great champion of the empire against the Goths. Justin's wife Sophia, a haughty and ambitious woman, hated Narses on private grounds, and persuaded her husband to recall him, adding, in her own hand, that he ought to leave the cares of state to men, and live for the future among the maidens of the palace, who would teach him to spin. Stung to the quick the old general opened negotiations with Alboin, king of the Longobards, and invited him to pour down his hordes upon Italy, an invitation which the barbarian chief was not slow of accepting. Narses, repenting of his treachery, died of a broken heart when he saw the fairest provinces of Italy laid waste by fire and sword. His repentance came too late, and the whole of northern Italy, along with a great portion of the peninsula, was soon lost to the Roman empire. Persia, under its great king Chosroes, next rose in arms against Justin. The fortress of Dara, the bulwark of the empire, was taken, and the fairest provinces of Asia were overrun and devastated as completely as those of Italy had been by the Longobards. These accumulated disasters unmanned the spirit of the emperor, who resigned the conduct of affairs into the hands of his wife. An ignominious peace was obtained from Persia on the payment of a large annual tribute. Justin, hopeless of retrieving his losses, named Tiberius, the captain of his guard, as his successor. This great general had been practically at the head of affairs since the year 574, and in the September of 578 Justin publicly resigned in his favour. This last act of his life showed a sense and wisdom which he had never before displayed. He only survived his abdication by about a month.

JUTERBOCK, a walled town, capital of a circle of the same name, in the Prussian province of Brandenburg and government of Potsdam, on the River Rohrbach, 40 miles S.S.W. of Berlin, with which it is connected by railway. It has manufactures of woollen and linen cloth, and some trade in horses, cattle, and wool. In the church of St Nicholas is the indulgence-box taken from Tetzels by a knight to whom he had previously sold a pardon for any sins he might commit. At Dennewitz, in the vicinity, on 6th September 1813, the Prussians under Bülow defeated the French under Ney. Pop. (1849) 5632.

JUVENALIS, DECMUS JUNCTUS, one of the greatest of the Roman classics, the details of whose personal history are both scanty and obscure. What little we know of his life is chiefly derived from a biographical sketch of him, purporting to be written by Suetonius, but more probably the work of some later hand. According to this authority he was the son or foster-child of a rich freedman of Aquinum, where he was born about A.D. 40, in the reign of Caligula. Though carefully trained to the bar, and extremely fond of declamation, he never pleaded professionally, but practised his art in the schools as a mental discipline. The praise awarded to some satirical lines which he composed on the actor Paris, then high in favour and power at court, encouraged him in that kind of composition. He suppressed his satires, however, for some time; but when at length he published them in his sixtieth year, they took the world by surprise, and gained a great name for their author. The severity with which the old poet lashed the degeneracy of public morals and the decay of the old national greatness became offensive at court, and Hadrian, on pretext of rewarding his services, gave him the command of a cohort, which was then on its way to garrison a frontier fortress of Egypt. Soon after reaching this place of honourable exile Juvenal died of chagrin and disappointment. At the time of his death he was in his eighty-first year. Such is the gist of the great satirist's life as given in the sketch attributed to Suetonius. Meagre as it is, however, much of it has been already shown by modern criticism to be unauthentic. All that we can accept as undoubtedly true is that the poet was born, or at least spent much of his time

at Aquinum during the latter half of the first century after Juvenalis. Christ. From other sources we know that he lived on terms of intimate friendship with the poet Martial.

To the scholar the works of Juvenal are of the highest value, from the insight which they give into the social and moral condition of Rome, during the first century of the Christian era. A richer or more tempting field has seldom opened to the satirist than offered itself to him. The foundations of the old Roman virtue had been sapped, and the worst vices had been openly practised and fostered by the Neros and Domitians. On such an age the genial humour and sly sarcasm of Horace would have been wholly thrown away. None who could not boldly and even fiercely denounce its vices, crimes, and follies, would have gained a hearing. Conscious of this, and imbued in no small degree with the vicious taste of the schools, Juvenal adopted that style of splendid and vehement declamation, which, had his force and weight of thought been less, might have degenerated into sheer bombast and hyperbole. Even as it is the rhetorician not seldom throws the moralist into the shade, and a wholesome lesson is often sacrificed to a brilliant point. This indeed is the capital defect of his writings,—they are too ambitious, too obviously artistic, too manifestly designed to dazzle or to stun. At the same time it must be remembered, that, in so far as his aim was to produce effect, he succeeded as no Roman author, Horace himself hardly excepted, ever did. There is no Latin composition, from which so many thoughts and expressions have passed into the common speech of all languages, as the Tenth Satire of Juvenal—the highest flight of the satiric muse of Rome. It is in its author's best vein. Fulfilling the negative conditions of satire in ridiculing and denouncing vice and folly, it also fulfils the positive conditions of a moral essay by alluring and encouraging to virtue. In loftiness and purity of sentiment it stands unsurpassed in Greek or Roman literature, and the moral precepts it embodies may safely claim a high place even in the Christian ethics of modern times. In all his other satires the gold is mixed with much alloy. The vices which he lays bare and chastises he displays with a revolting minuteness of detail which disgusts the pure, while it feeds the morbid appetite of the depraved mind.

It is not easy to see how a man of strictly pure life should have that wonderful familiarity with the social corruptions of Rome under the empire which Juvenal delights to show. We have no grounds for asserting that he was personally tainted with any of those hideous vices which he describes with so much force and fulness. Yet his satires are manifestly the fruits of a personal experience, and their teaching is of that directly practical kind, which could only have been aimed at by one who had tracked vice and crime to their haunts, and seen with his own eyes their operation and results. It quite accords with the laws of human nature, that he should in his youth have drained the cup of dissipation, and when wisdom came with maturer years and cooler blood, that he should lash with no sparing hand the follies of his own early life. Many, if not most of the great satirists of the world, have merely reflected in their works their struggles with temptation, their defeat at first, and their final victory.

The editions of Juvenal are very numerous. That of Ruperti is the most popular, and, so far as the text is concerned, is the best; Heinrich's, in virtue of its notes and commentaries, is better still. The editions of Henninius, Leyden, 1695; and Achaintre, Paris, 1810, are also highly valuable. The English translations of Juvenal are numerous. Those of Holyday, Gifford, Badham, and Hodgson, are the most common. Dryden translated the First, Third, Sixth, Tenth, and Sixteenth Satires with great force and spirit, though often with little reference to the original. The French prose version of Dusaulx, more elegant and correct than that of Gilbert, is less forcible and characteristic.

K.

K
||
Kaempfer.

K, the eleventh letter, and eighth consonant, of our alphabet, is formed by a guttural expression of the breath. Its sound is much the same with that of the hard *c*, or *qu*, and it is used for the most part only before *e*, *i*, and *n*, in the beginning of words, as *ken*, *kill*, *know*, and the like. It used formerly to be always joined with *c* at the end of words, but is now omitted. Thus, for *publick*, *music*, we now write *public*, *music*, and so on. However, in monosyllables it is still retained, as *jack*, *block*, &c.

K was borrowed from the Greek *kappa*, or the Oriental *kaph*, and finds only an ambiguous place in occidental alphabets. Priscian looked on it as a superfluous letter, and says that it was never to be used except in words borrowed from the Greek. Dausqueius, after Sallust, observes that it was unknown to the ancient Romans. Indeed we seldom find it in any Latin authors, excepting in the word *kalende*, where it sometimes stands instead of *c*. Carthage, however, is frequently spelt on medals with a **K**—*SALVIS AUG. ET CAES. FEL. KART.*; and sometimes the letter **K** alone stood for *Carthage*. M. Berger has observed, that a capital **K**, on the reverse of the medals of the emperors of Constantinople, signifies *Konstantinus*; and that on the Greek medals it signified *KOLAH SYPIA*, *Cole-Syria*. Lipsius observes, that **K** was a stigma anciently marked on the foreheads of criminals with a red-hot iron. For its modern use, see ABBREVIATIONS.

K is also a numerical letter, signifying 250. When it had a stroke above it, **K̄**, this letter stood for 250,000. **K** on the French coinage denotes money coined at Bordeaux.

KAEMPFER, **ENGELBERT**, a celebrated naturalist and scientific traveller, was born in 1651 at Lemgo, in the principality of Lippe Detmold in Westphalia, where his father was rector of the church of St Nicholas. Trained at first by his father, he went to prosecute his studies at Hameln in Saxony, and afterwards at the schools of Luneburg, Hamburg, and Lubeck. In all these places he distinguished himself by the ardour and success with which he studied history and geography, and the languages both living and dead. After graduating as Ph. D. at the University of Cracow in Poland, he removed to Königsberg in Prussia, where he spent four years chiefly in the study of medicine and the natural sciences. His early training, whether accidentally or by design, seems to have been fitted exactly to make him what he afterwards became, the most enlightened traveller of his age, and the worthy forerunner of the Pallases, Tourneforts, and Humboldts of a later age. In 1681 Kaempfer visited Upsal in Sweden, and many tempting proposals were made to him if he would consent to settle in that country. His desire for foreign travel, however, led him to decline these offers; but he gladly agreed to accompany as secretary the embassy which Sweden was at that time preparing to send through Russia to Persia. Setting out from Stockholm on the 20th of March 1683, they passed through Moscow, where they were sumptuously entertained, and arrived at Astrakan on the shores of the Caspian Sea. There they embarked for Persia, and landing at Nizabad pursued their way to Ispahan, which they entered in a little more than a year from the day they set out on their travels. Kaempfer was the first naturalist that ever set foot in the more sequestered spots of Georgia, and the strange aspects and operations of nature that met him at every step are described in some of the most interesting chapters of his *Amoenitates Exoticae*. With his appetite for foreign travel thus whetted, Kaempfer refused to return to Europe with the embassy. Various reasons, most of them very absurd, have been assigned by his biographers

for his conduct. His real motive was to pursue his scientific investigations in the rich and fresh field of the East. A residence of two years in the Persian capital enabled him to master the natural history and botany of the surrounding country. At the end of that period he entered the service of the Dutch East India Company as head surgeon of their fleet which was then cruising in the Persian Gulf. An illness with which he was seized at Gomron disabled him for active service for two years, and, indeed, nearly proved fatal. In 1688, however, he set sail in the Dutch fleet for Batavia, touching at various points of interest on the coasts of Hindustan, Ceylon, and Sumatra. Arriving at his destination in 1689, he spent the winter of that year in investigating the natural history of Java, and in the month of May following set out to Japan, as physician to the embassy which the Dutch used to send yearly to that island. He embarked in a ship which was to touch at Siam, and had thus an opportunity of visiting Ayuthia, which has since been supplanted by Bang-kok as the capital of the country. In the September of 1690, he landed at Nagasaki, where he was allowed to remain for fully two years, during which he twice visited Jeddo, the capital. His adroitness, insinuating manners, and medical skill overcame the habitual jealousy of the natives, and enabled him to elicit much valuable information which he has embodied in his *History of Japan*. Returning to Europe in 1693, and graduating as doctor of medicine at Leyden in the following year, he settled quietly down in his native city, there to spend the remainder of his days. His design was to edit and publish his travels at his leisure; but being appointed physician to the Count of Lippe, he soon found himself involved in the cares of an extensive medical practice. In 1712 he gave to the world his *Amoenitates Exoticae*, intended, as he remarks in the preface, as a kind of prelude to a complete edition of his works. Unfortunately, however, he did not live to carry out his plan. An unfortunate marriage, and other domestic calamities following thick upon each other, broke down his health, already sufficiently impaired by his travels. He died on the 2d of November 1716, in the sixty-sixth year of his age.

The original of Kaempfer's *History of Japan* has never been published, for what reason is unknown. Sir Hans Sloane bought from his heirs a MS. copy which was translated into English by J. G. Scheuchzer, and published in 2 vols. fol. in 1727. From this English version the work has been translated into French and German. This work of Kaempfer's is probably unique among books of travels. After an interval of nearly two centuries, it remains as true and applicable to the actual condition of Japan as when its author first set foot on the island. Subsequent travellers have acknowledged the conscientious accuracy of his descriptions of the civil and religious, as well as physical, condition of Japan. To the general reader it is intensely interesting for the rare information which it gives. The great work of the American expedition does not even yet supersede that of the German naturalist.

KAFFA, **THEODOSIA**, or **FEODOSIA**, a fortified sea-port town of Russia on the S.E. coast of the Crimea, and on the western side of a wide gulf of the same name; N. Lat. 45. 2, E. Long. 35. 20. It occupies the site of the ancient Theodosia, an important town of the Greek kingdom of the Bosphorus. It was founded by Milesian colonists at an early period, and was taken after a long siege by Leucon, king of the Bosphorus, who named it after his wife Theodosia. He likewise made it a port, and gave certain advantages to Athenian vessels coming there for purposes of trade, so

Kaffa.

Kafraria.

that in a short time it became a place of great commercial importance. After many vicissitudes, it came into the hands of the Genoese in the thirteenth century, and became the seat of an extensive commerce with the East by way of Persia and the Caspian. During this period it is said to have contained 80,000 inhabitants, but after its capture by the Turks in 1474, its prosperity rapidly declined. Since it came into their hands, the Russians have attempted to revive its former greatness, but with very partial success. Kaffa was declared a free port in 1806; and a museum of antiquities, botanic garden, and public library have been established by the Russian government. The harbour is protected by a promontory from the S. and S.W. winds, and there is excellent anchorage with deep water two cables' length from the shore. Pop. (1849) 8435.

KAFRARIA, OR KAFIRLAND, taken in its widest sense as denoting the country chiefly peopled by the Kafirs, extends along the eastern shores of South Africa, from the River Keiskamma, the eastern boundary of the colony of Cape of Good Hope, to Delagoa Bay, a distance of about 700 miles, and stretches inland to a distance varying from 150 to 400 miles from the sea. Within these limits are included,—1st, British Kafraria, lying between the Rivers Keiskamma and Kei. 2d, The country between the Kei and the River Umzimkulu, the south-western boundary of the British colony of Natal, called in recent maps Kafraria Proper. 3d, The colony of Natal, extending along the seaboard from the Umzimkulu to the Rivers Tugela and Umzimyati, and inland to the Drahenberg, or Kathlamba Mountains. 4th, The country ruled by the Zulu-Kafirs, stretching from the last-named rivers to the vicinity of Delagoa Bay. 5th, The country formerly called the Orange River sovereignty, now the territory of the Free Dutch republic of that name; and, 6th, The country north of the Vaal River, under the rule of another section of Dutch boers, and called the Transvaal republic. In the narrower sense of the term, however, Kafraria is taken to include only the two first-named districts lying between the eastern boundary of the Cape Colony and Natal.

In this article, our remarks on the physical features of the country apply only to those narrower limits, but part of our observations on the people will include the whole Kafir race.

In its general formation, the country resembles the Cape Colony, rising from the sea in a series of steppes or plateaux, the walls of which are formed by ranges of hills nearly parallel to the lofty range which, for the most part, forms its N.W. boundary, consisting of the Amatola, the Winterberg, Stormberg, and Kathlamba, or Drahenberg Mountains. These steppes, however, are not so well defined as in the Cape Colony, and the surface of the country is extremely varied, in some parts presenting plane and tableland, in others a succession of gently sloping hills; in others lofty mountains rear their rugged and scarped sides, intersected by deep ravines, which form the beds of mountain torrents. The latter description particularly applies to the Amatola Mountains in British Kafraria, which have formed the stronghold of the Kafirs on so many occasions. A considerable part of British Kafraria is covered with dense bush; consisting, for the most part, of a thorny mimosa. Beyond the Kei, however, the upper part of the country is generally open and devoid of wood, except in ravines and the folding of the hills; but near the coast there are fine timber trees, in some places forming dense forests, in others scattered singly or in clumps, and giving the country a beautiful park-like appearance. The rivers in Kafraria run nearly parallel to one another, flowing from the several ranges of hills into the Indian Ocean. The most considerable of them are the Kei, the Umbashi, the Umtata, the Umsimvubu, or St John's River, and the Umzimkulu. They flow, for the most part, between high banks fringed with brushwood or in some places shaded by large trees,

and, like all mountain streams, are low and feeble in the dry weather, but swollen and turbid in the rainy season. None of them are navigable, except the St John's or Umsimvubu, which will admit small craft to a distance of about 10 miles from the sea. There are no harbours on the coast, except that of East London, in British Kafraria, but it is scarcely more than an open roadstead, and far from safe.

The vegetable productions of Kafraria are similar to those of the Cape Colony. Oats, barley, rye, and most kinds of vegetables grow well in the valleys, and where irrigation can be applied. Wheat will also grow, but the crop is more uncertain than that of other grain just named, which are all, more or less, subject to rust, smut, and mildew. Indian corn and a species of millet, called Kafir's corn, thrive remarkably well. Indigo is indigenous. Cotton has been planted on a small scale, and found to grow extremely well. The forests produce a variety of timber for building and cabinet-making.

The wild animals of Kafraria are similar to those found in the Cape Colony. In regard to domestic animals, horned cattle thrive well, but sheep are subject to disease, unless kept on the higher ridges. Poultry of all kinds thrive well.

The climate differs in some respects from that of the Cape; the greatest amount of rain falls in the spring and summer. The winter is generally dry. In summer the heat varies from 70° to 90°; in the winter it is seldom below 50° in the day time; but the nights are very cold, and snow falls on the mountains. The temperature is subject to great changes within the space of very few hours; but the climate is, on the whole, extremely healthy.

British Kafraria, not being within the Cape of Good Hope, is not subject to the legislation of its parliament; it is, however, under the governor of that colony, who rules it by regulations based chiefly on military law. Its chief town is King William Town, on the left bank of the Buffalo River, about 40 miles from the sea. Besides it, there are several forts duly garrisoned, scattered over the country. In the country between British Kafraria and Natal, there are no European settlers, except missionaries and a few traders. It is entirely under native rule. The British government, however, has agents or residents in some places, whose duty it is to advise the native chiefs, and to protect British interests. They have not, however, hitherto been found very useful.

The name Kafir is of Arabic origin, meaning infidel. It was applied to the natives of the south-eastern shores of Africa by the early Portuguese discoverers, who probably received it from the Moorish navigators of the Mozambique Channel. It was afterwards adopted by the Dutch settlers of the Cape. By them and their British fellow-colonists the name is applied to all the tribes of the race living within the limits mentioned in the beginning of this article, whose form and appearance, and kindred languages, show a common origin. The several tribes are distinguished by names generally derived from former chiefs from whom they or their ruling families sprung. The tribe called *Amazosa* inhabit the country from the Keiskamma to the Umbashi river. This is the tribe, the various branches of which have so often come into collision with the Cape colonists and the British forces. The Amatambu or Tambookies dwell on the high land at the sources of the rivers N. of the Amazosa, and nowhere approach the sea. Between the Bashi and the Umzimkulu Rivers dwell various tribes, the most powerful of which are the Amaponda, under their chief Faku, and the Amabarca. Beyond the latter river the natives of Natal are composed mostly of refugees from the Zulu country. They are incorrectly called Zulus, being chiefly fragments of tribes formerly inhabiting Natal or its neighbourhood, who were broken up by the Zulu conqueror Chaka, and incorporated into his nation. Beyond Natal, again, as far as Delagoa Bay, the country is inha-

Kafraria.

Kafraria. bited by various tribes; but, being under the rule of the Zulu king and his tribe, it is commonly called the Zulu country. The native tribes of the Orange River and Transvaal countries of the Kafir race are—the Basutos, the chief of whom is the famous Moshesh; the Manlits; the Bechuanas; and the Matabele.

Various conjectures have been formed as to the origin of this race. That of Sir John Barrow is most plausible, viz., that they sprung from a tribe of Bedouin Arabs, who moved from the N.E., gradually traversing the eastern border of Africa. In this case, however, they must have mingled and intermarried during their passage with some negro races, since their appearance shows some affinity to both races.

The question, how long, and under what circumstances, they occupied the country they now and recently possessed in South Africa, has given rise to some discussion. We believe the following is the substance of most that is known on the subject. Although there are strong grounds for supposing that the race at no very remote period were strangers to South Africa, yet it is certain that the Portuguese discoverers in the sixteenth century found them inhabiting the country from Delagoa Bay to the southward of Natal. It is, however, probable that they did not then extend S. of the River Kei; and it is certain that they were not S. of the Keiskamma, since there is reliable evidence to prove that at a comparatively late period they took possession of the country, then belonging to the Hottentots, between the latter river and the Gamtoos. This fact is admitted by all who have studied the subject—the only question being as to the mode of acquisition; some contending that it was by purchase from the Hottentots, others that it was by conquest. The latter is the more probable opinion.

Without entering on the history of the several tribes comprising this widely scattered race, we shall confine ourselves to a brief sketch of the recent history of the two tribes with which this country has had most intercourse, viz., the Amaxosa, or Cape Frontier Kafirs, and the Amazulus, or the Kafirs near Natal; together with a short statement of the more prominent traits common to the whole race.

The Amaxosa. This tribe, the Amatambu, and the Amaconda, probably sprung from a common ancestor named Zwide, who lived upwards of 300 years ago. The eldest, or most direct branch of his descendants is doubtless represented by the Amatambu or Tambookies; since, by the other two tribes they are regarded as the royal race, and the chiefs generally take some of their wives from them, whose sons inherit their father's rank, to the exclusion even of elder sons by other wives.

The immediate ancestor of the Amaxosa was Toguh, from whom descended Palo. The latter had two sons, from whom sprung the principal chiefs on the frontier; Galeka the eldest, the founder of the Amagalekas, whose head is the paramount chief of the Amaxosa, and Hahabi, whose sons were Omlao and Thlambi. Gaika, the son of the former, was the founder of the Gaikas and the father of Macomo, Tyali, and Sandili, the chief of the branch. From Thlambi the Ithlambis sept take their name. The subjoined table will render this account clearer:—

The Gaikas and Thlambis live close to the Cape frontier, the Amagaleka, beyond the Bashi River.

The Dutch settlers at the Cape first came in contact with the Kafirs of this tribe about 1740. The Gamtoos River was then their boundary, and mutual injuries led to frequent skirmishes between them, but the first regular war took place about 1780, when a *commando*, as it was called, of Dutch drove the Kafirs over the Great Fish River, which was then settled as the boundary between the two races. A guerilla warfare, however, was still being carried on, when, in 1795, under the circumstances mentioned in our article on the Cape, the British took possession of the country, which they held till 1802, when it was restored at the peace of Amiens. During this period the Dutch boers settled on the eastern frontier gave the British authorities great trouble. A force under General Vandeleur was sent against them, and succeeded in reducing them to order, but it afterwards encountered a body of Kafirs under the chiefs Congo and Thlambi, with very doubtful success. From 1802 to 1806, when the Dutch again held the Cape, matters continued in the same position on the eastern border,—the boers, in more or less open rebellion against the government, and carrying on guerilla warfare with the Kafirs.

In 1806 the Cape was finally taken possession of by the British. The Kafirs had again taken possession of the country west of the Fish River, and committed depredations on the colonists, when, in 1811, Sir John Cradock, with a considerable force defeated them and drove them beyond that boundary. It was during this campaign that the Landtdrost Stockenstrom was murdered by the Kafirs at a conference which he had sought for the purpose of inducing them to lay down their arms. In 1817 Lord Charles Somerset, governor of the colony, in consequence of disturbances on the frontier summoned a chief named Gaika to an interview with him, in which he acknowledged that chief as the head of Kafirland, gave him certain privileges, and held him responsible for the acts of the nation. This was a great error, and led to mischievous results. Gaika was not entitled to this rank. He was merely head of a sept of Amaxosa Kafirs, the paramount chief of whom was, as we have stated above, the chief of the Amagalekas at this period, one Hintza, whom Gaika acknowledged as his chief. The first consequence of this ill-advised measure was, that Gaika being attacked by a kindred chief named Thlambi, sought for and obtained the assistance of the government, which then improperly interfered in native quarrels. This led to the invasion of the colony by the Kafirs under Thlambi and Congo, and the war in 1819, during which Graham's Town was attacked by the enemy, who were repulsed with great loss by a small force under Colonel Willshire. The result of this war was the expulsion of the Kafirs from the country between the Great Fish and Keiskamma Rivers, which was declared to be neutral ground, to be occupied neither by colonists nor Kafirs, but still some of the latter were allowed to occupy it. Some time after this, in 1820, 5000 emigrants, mostly Scottish, were sent by government to the eastern part of the colony, and were at first partly located in this neutral territory by Sir Rufane Donkin, who was acting as governor in the absence of Lord Charles Somerset. The latter, however, on his return, refused to confirm this arrangement, and ordered the settlers to withdraw within the former limit of the colony, but his lordship shortly afterwards gave away large tracts of land in this territory to persons the nature of whose claims will not admit of close investigation. A year or two after this, an attempt was made, under the sanction, as it is said, of the governor, to seize the person of Gaika during a time of peace. The design was frustrated, and it served only to provoke the enmity of the Kafirs and produce hostilities. In 1828 the whole of the Amaxosa Kafirs were threatened with destruction by Chaka, the ter-

Kafraria. rible Zulu chief, who had subdued Natal, and was advancing towards the Cape frontier. The Kafirs called upon the government for aid, but the Zulu chief withdrew his forces mainly, we believe, out of respect for British authority. A force however was sent against him, which unfortunately attacked and defeated a tribe under the chief Matuwana, which had been in no way concerned in the meditated invasion, but had itself been driven from Natal by the Zulu armies. It was at this time that a large body of Kafirs of various tribes, driven from Natal and its vicinity by Chaka's armies, took refuge with the Amaxosa Kafirs chiefly with the Amagaleka branch, by whom they were reduced to a species of slavery under the name of Amafingu or Fingoes. In 1828, Lord Charles Somerset was succeeded in the government by Sir Lowry Cole. In 1829 the chief Gaika died, and was succeeded by the infant Sandili, his son by his chief wife; but during the minority of the child, the government of the tribe now called Gaikas devolved on his elder half-brother Macomo. Macomo and his followers had hitherto been permitted to live on the Kat River, part of neutral ground, but now, on account of his attack on the Amatémbu Kafirs, he was ordered to leave that locality, upon which a settlement of Hottentots was established with a view of helping to check the inroads of the Kafirs. This is the origin of the celebrated Kat River settlement. In 1833, Tyali, another of Gaika's sons, who had been allowed to live on the neutral ground, was removed to beyond the Keiskamma. Shortly afterward, both Tyali and his brother Macomo were permitted to return within this colony, but were again expelled. The course pursued towards these chiefs seems to have been very vacillating and to have been among the causes which led to the next war.

Sir Benjamin D'Urban assumed the government in 1834, and towards the close of that year a vast mass of Kafirs poured into the colony, headed by the chiefs Tyali, Macomo, and Xoxo, sweeping over the frontier district, murdering the farmers in their course, and burning their homesteads.

The colonial authorities were unprepared for the invasion, but Colonel (afterwards Sir Harry) Smith and the governor proceeded at once to the frontier, and with a force of about 3000 men, about one-half being regular troops, marched into Kafirland. In the course of about nine months the Kafirs were subdued, and a treaty was entered into with them, by which the country as far as the River Kei was declared to be British, and the people subjects of the crown. During this war an incident occurred which has given rise to much discussion. Hintza, chief of the Amagalekas, who, as such, was paramount chief of the Amaxosa Kafirs, that is, of nearly all the Kafirs on the frontier, had openly refused to take part in the war; but the governor suspecting, not without reason, that he had covertly assisted to foment it, and had received cattle stolen by the Kafirs actually engaged in hostilities, crossed the Kei River and encamped near the chief's residence. Hintza, to save his country from destruction, went to the camp of the governor, who demanded of him compensation in cattle, for the property stolen from the colonists, and also the liberation of the Fingoes, who, as mentioned above, were held in a species of servitude by the Amaxosa Kafirs. To these terms, Hintza assented, and voluntarily remained in the camp, though told he was free to depart. A few days afterwards, a report arrived that the Kafirs were murdering the Fingoes. This the governor supposed to be the result of Hintza's orders, and that chief was informed that having broken the terms agreed to, he would be held responsible for the safety of the Fingoes, upon which he sent to his people to stop the massacre, and his order was obeyed. * The cattle demanded as compensation for the colonists' losses not having arrived within the stipulated time, Hintza was tried. He was considered responsible for their payment. He stated that his people would obey his orders, and produce the

cattle, if he appeared among them supported by a British force. The governor sent him with a detachment of troops under Colonel Smith towards the Bashi, but he was warned that any attempt to escape might cost him his life. On the road the chief clearly evinced his desire to prevent his people's cattle from being taken, and, at length, being well mounted, and seizing a favourable opportunity, he attempted to make his escape. He was pursued by Colonel Smith and those about him, and, after a desperate chase and personal struggle, he was shot dead, by a Mr Southey, in self-defence it is alleged, as the chief was on the point of stabbing him with an assegai. Other versions have been given of this transaction, but the above we believe to be substantially correct. Lord Glenelg, the colonial secretary, who had previously taken a very unfavourable view of it, was led by a subsequent enquiry to consider that Hintza had been, if not the fomentor of the war, at least engaged in a secret alliance with its authors. The account of the chief's death is taken from Sir Harry Smith's and Mr Southey's statements, but we have had opportunities of hearing them confirmed by the evidence of impartial and most trustworthy persons who were near the scene.

The proceedings of the governor were disapproved of by the colonial minister, the ceded country ordered to be restored, and Sir Benjamin D'Urban was recalled.

The chief grounds on which this course was adopted, briefly stated, were as follow:—1st, That the Kafirs were justified in engaging in the war by the encroachments made on their territory, and other wrongs inflicted on them by the government and the colonists. 2d, That the war had been conducted in a manner at variance with the principles of humanity. 3d, That the proposed extension of the colonial limits would involve an expenditure for civil and military establishments beyond all proportion to the wealth and number of the inhabitants.

Lord Glenelg, at the same time, laid down rules for future intercourse with the Kafirs, of which the following is the substance:—1st, That the responsibility of villages or kraals for the acts of individuals must no longer be enforced. 2d, That the chiefs alone should be looked to for restitution of stolen property, they being left to detect offenders, or indemnify themselves at the expense of the tribe collectively. 3d, That the killing or wounding a Kafir should be considered in the same light as the like offence committed on Her Majesty's subjects.

This reversal of Sir Benjamin D'Urban's policy, and his recall, together with other causes stated in a former article, led to the emigration from the colony of a large number of Dutch boers to countries beyond the boundaries.

In December 1836 the restoration of the ceded territory took effect, and Mr Stockenström was appointed lieutenant-governor of the eastern frontier, for the purpose of carrying out the policy laid down by Lord Glenelg. Treaties were entered into with the several chiefs, defining their rights and responsibilities.

This policy, however, was distasteful to the mass of the frontier colonists, and Lieutenant-Governor Stockenström was shortly recalled, solely on the ground of his unpopularity, and rewarded with a baronetcy and a pension.

Meanwhile, Sir George Napier had succeeded Sir Benjamin D'Urban as governor-in-chief, and, during his six years term of office, peace was generally maintained. In 1844 Sir Peregrine Maitland became governor, who seems to have seen cause to alter, in some respects, the treaties made by Sir Andries Stockenström. Affairs assumed a very disturbed aspect on the frontiers, and in 1846 another Kafir war commenced.

The immediate cause of this war was an attack, in which a Hottentot was killed, made by a party of natives on a escort which was conveying a Kafir, who had committed a theft, to Graham's Town for trial. There is no doubt the

Kafraria.

Kafraria. Kafirs were eager to find a pretext for war, although the conduct of the colonial authorities on this occasion was not wholly free from blame. The Gaikas were the chief tribe engaged in this, but they were, in the course of it, assisted by the Tambookies. A British force marched into Kafriland, the Amatola Mountains were stormed and taken possession of by a burgher force under Sir Andries Stockenström, who afterwards defeated the Tambookies under Mapassa. The Gaikas again occupied the Amatolas, but at length Macomo surrendered himself, the Kafir who killed the Hottentot was given up, and peace seemed to be restored. On the arrival, however, of Sir Henry Pottinger in 1847, hostilities recommenced, and were carried on with great energy, till at length Sandili, the chief of the Gaikas, surrendered himself as a prisoner. In October 1847, Sir Henry Pottinger was succeeded by Sir Harry Smith, who, after exacting the submission of the chiefs, and proclaiming himself paramount chief of the Kafirs, liberated Sandili. The country was again declared to be under British rule, and a part of the land was disposed of to white settlers. At the same time a machinery of government was established in the country, consisting of a chief commissioner, assisted by subordinate magistrates, and a police force, partly composed of Kafirs, armed with muskets and bayonets.

During the temporary peace which ensued, the convict agitation took place, of which some account is given elsewhere (see CAPE OF GOOD HOPE), but it is referred to here because some persons have, not without reason, in part attributed to it the war of 1850, as the Kafirs may have considered that the divisions which that agitation caused between sections of the population, especially between the Dutch and British, presented a good occasion for renewing hostilities. Another cause of the subsequent outbreak was, we think, the too hasty weakening of the military force on the frontiers after the last war, by sending away several regiments. This measure of false economy was enjoined on the governor by the ministry at home, who, in their turn, were urged by a strong party in Parliament to diminish the military expenditure.

About October 1850 it was reported that the Kafirs, excited by the eloquence of a pretended prophet, named Umlanjeni, were preparing for war. Sir Harry Smith proceeded to the frontier, but refused to believe that an outbreak was at hand, although many signs of the coming storm were observed and pointed out by the authorities and people on the spot. However, he summoned Sandili and the other chiefs to an interview. Sandili refused obedience; upon which, at an assembly of other chiefs, the governor declared him deposed from his chiefship, and appointed an Englishman, Mr Brownlee, a magistrate, to be chief of the Gaika tribe. This measure is said to have been the immediate cause of the ensuing outbreak; but there is no doubt that the Kafirs had already determined on war. On the 24th of December Colonel Mackinnon, being sent with a small force to capture Sandili, was attacked in a narrow defile by a large body of Kafirs, and compelled to retreat with some loss. This was the signal for a general rising of the Gaika tribe. The settlers in the military villages, assembled in fancied security to celebrate Christmas day, were surprised by the treacherous foe, many of them murdered, and their houses given to the flames. Other disasters followed in quick succession. A small patrol of military was cut off to a man. The greater part of the Kafir police deserted, many of them carrying off their arms and accoutrements. Flushed with success, the Kafirs in immense force surrounded and attacked Fort Cox, where the governor was with an inconsiderable force. His situation was truly critical. More than one unsuccessful attempt was made to relieve him; but his dauntless spirit was equal to the occasion. At the head of 150 mounted riflemen, accompanied by Colonel Mackinnon, he dashed out of the fort, and,

through a heavy fire of the enemy, rode to King William's Town,—a distance of 12 miles. Meantime, a new enemy appeared. A large number of the Kat River Hottentots, who had in former wars been our firm allies, rose in rebellion. This revolt was followed by that of the Hottentots at other missionary stations; and part of the Hottentots of the Cape Mounted Rifles followed their example. We have only space to state the general results of the war. After the confusion caused by the sudden outbreak had subsided, and due preparations were made; Sir Harry Smith and his gallant force soon turned the tide of war against the Kafirs. The Amatola Mountains were stormed; the paramount chief Krili, who all along covertly assisted the Gaikas, was invaded and severely punished. In April 1852 Sir Harry Smith left the country in consequence of his recall, and was succeeded by Lieutenant-General the Honourable George Cathcart. The new governor completed the work which his predecessor had so well advanced. Krili was again attacked and reduced to submission. The Amatolas were finally cleared of Kafirs, and small forts erected among them to prevent their reoccupation.

Having subdued British Kafraria, the governor turned his attention to another region. During the war, the Orange River sovereignty had been the scene of anarchy and confusion. Collisions had thus taken place between her Majesty's troops and the Basuto tribe, under the chief Moshesh, caused by the alleged depredation committed by that tribe on the Dutch farmers and another tribe called Bosolongs. At one time matters were in so critical a state in this region that the British resident there wrote the lieutenant-governor of the neighbouring colony of Natal, to send some Zulu Kafirs (as the natives of Natal are called) to his assistance. In a very short space of time the lieutenant-governor raised the required force, which, together with a small party of military under Captain Parish of the 45th regiment, marched in the middle of winter over the Drachenberg Mountains into the sovereignty, the lieutenant-governor accompanying the force to the summit of the mountains, where his jurisdiction terminates.

To punish Moshesh and the Basutos, General Cathcart, with a force of 2500 men, now marched into the sovereignty, and, after some fruitless negotiation with the chief, was attacked by his tribe in overwhelming numbers, all mounted and well armed. The action lasted a whole day, and terminated in a doubtful victory, the loss on the side of the British being thirty-eight men killed and many wounded. The chief Moshesh, however, showed singular forbearance. Feeling, as he said, assured that the partial success which had crowned his arms could be only momentary, and that he never could hope to contend with the British forces, he sent, on the night after the battle, for a missionary residing near him, and had a letter written to the governor suing for peace. The request was granted, and the governor and his force retired. Not long after this event the sovereignty was, as mentioned in the article on the Cape, given up to the Dutch boers. On his return from this expedition, General Cathcart instituted measures for securing the permanent peace of the frontiers. He issued regulations for governing the country under martial law. The mountain part of it, from which the Gaikas had been expelled, was made a royal reserve, in which certain military posts were to be established, to serve as centres of villages to be occupied by colonists on condition of military service. The General considered it necessary to the success of his measures that an adequate regular military force should be kept in the district, until some organized corps of military colonists could be sent to colonize it. General Cathcart left the colony in 1854, and was succeeded by Sir George Grey, K.C.B., late governor of New Zealand, who has given a general outline of the policy he proposes for the government of Kafraria. The chief features of it are, the

Kafrraria.

establishment of institutions for the education of the children and the relief of the sick, and the employment of the Kafirs on the construction of roads to open up the country. He estimated the cost of these measures at L.45,000 per annum, L.40,000 of which is to be provided by the British Parliament for a limited period. Parliament in 1856 made this grant. Sir George Grey has further proposed the introduction of military pensioners from this country. This measure could not be carried out, owing to the unwillingness of the pensioners to go out; but their want is likely to be in some degree supplied by the settlement of the disbanded German Legion in the country.

The Zulu
Kafirs.

We proceed to give some account of these tribes. The Portuguese, in the sixteenth century, found the country from Delagoa Bay to the southward of Natal peopled by Kafirs divided into small tribes. Little is known of them until 1810, when an extraordinary character arose in the country just north of Natal. This was Chaka, son of the chief of a small tribe called Zulus. Owing to accidental circumstances, he was brought up by the chief of a neighbouring and very powerful tribe called the Umtelwas. This chief dying without heirs, Chaka, probably owing to his abilities, succeeded to the chiefship of that tribe, as well as to that of his own. The two tribes, thus united and ruled by a master-spirit, became a powerful nation, and went forth like a consuming fire to spread destruction among other tribes far and wide. Natal was almost depopulated, the majority of the people being annihilated, or incorporated into the conquering host. Some broken tribes took refuge with the Amaxosa Kafirs, by whom they were enslaved, under the derisive name of Amafingu or Fingoes. Chaka formed his warriors into regiments, and established a stern military discipline, which against other natives made him almost invincible. We have seen that he was on the point of attacking the Amaxosa Kafirs, but he desisted from doing so on finding that they were protected by the British government, for which he expressed the greatest respect. He possessed great intelligence, and extraordinary military skill. He was capable of noble and generous acts, but his general conduct was that of a cruel, relentless despot. The wanton massacres committed by his orders almost exceed belief. During his reign a party of British settled in Natal and were kindly treated by him. In 1828 he was murdered, at the instigation of his brother Dingaan, who succeeded him. Dingaan imitated the bloody acts of his brother, without possessing his ability or generosity. Towards the end of 1837 a part of the Dutch boers who, as we noticed in our article on the Cape, left the colony in 1836, found their way to Natal. One Retief, their leader, and about sixty-five followers, sought an interview with Dingaan, by whom they were barbarously murdered in cold blood. A bloody war then ensued between the boers and Dingaan, in the course of which the latter, at the head of a force 14,000 strong, was signally defeated with great loss by a party of 860 boers. During these hostilities, the governor of the Cape sent to Natal a small detachment of troops to try to prevent further bloodshed, but, being found useless for such object, it was soon withdrawn. A brother of Dingaan, named Panda, now joined the boers, with a large section of the natives. The combined force completely routed Dingaan, who fled to the neighbourhood of Delagoa Bay, where he was murdered by a tribe with whom he had taken refuge. The boers proclaimed Panda chief of the Zulus. In 1842 Natal was taken possession of by the British government after some severe fighting with the boers, and in 1845 it was created a separate government under a lieutenant-governor and other officials. As Panda's rule was nearly as cruel as that of his brothers, numbers of his subjects, chiefly those who had been subdued by Chaka, fled into Natal for protection. These refugees, very few of whom belong to the Zulu tribe, form the greater part of the black

population of Natal. Panda continues to rule over the country lying between Natal and Delagoa Bay, commonly called the Zulu country, and his power is still very formidable; but, owing to his fear of the Dutch boers beyond our jurisdiction, and other causes, he has hitherto remained on friendly terms with the British authorities.

Kafrraria.

In regard to form and appearance there is a slight difference between some of the tribes inhabiting so vast a tract of country. They may, however, be described generally as tall and well-formed; having regular features and well-developed foreheads; with skins varying from black to copper colour, and crisped woolly hair like that of the negro, only growing in small detached tufts. The Amaxosa are lighter in the skin, taller, and with an expression of countenance more fierce and haughty than the Natal and Zulu Kafirs and the kindred Fingoes.

Character,
of the
Kafirs.

The Kafirs generally are acute and subtle, with the usual faults of savages, duplicity and cruelty. They have, however, redeeming traits; for they are faithful when trusted, and not incapable of gratitude. Polygamy prevails universally—wives are purchased with cattle, and are compelled to work for their husbands, who pass their time in indolence, except when engaged in the exciting pursuits of the chase or war. A Kafir cannot marry a blood relation, but he may marry the widow of a deceased brother. As children, especially daughters, are valuable, instances are not unknown of old or impotent men giving out their wives to younger men, reserving his right to the children procreated. The clothing of the Kafirs consists of a cloak made of skins, or, latterly of a blanket. They wear armlets and necklaces made of animals' teeth or beads. They are also fond of wearing brass rings on their arms. Their war dress is more elaborate, consisting of kilts of skins, and head-dresses of feathers of various kinds. Their weapons are the assegai,—a kind of spear,—one kind of it being short, with a broad blade about 12 to 18 inches long, for stabbing; the other longer in the shaft, with a narrow blade about 9 inches long, for throwing. They carry large shields made of hides. They have latterly acquired firearms, and use them with some skill.

Their chief property is cattle, and the laws regulating its succession are very complicated, in consequence of polygamy, and producing much litigation. In general the eldest son of the chief wife succeeds to the chiefship. The government of the tribe resides in the chief, assisted by his head men or councillors. Many crimes are punished with death, especially such as affect the sovereignty of the chief; others, and among them, in some cases, murder, are punished with fine or confiscation of property.

In their savage state the Kafirs have little sense of religion. They believe in a Being who made the world; but that now, if not extinct, he takes no heed of its government. They conceive that the spirits of their forefathers exercise an influence over them, and they have a strong belief in witchcraft. The witch-doctor, who professes to discover wizards and witches, plays a prominent part in their social and political system. He is the ready instrument of oppression in the hands of the chief, who, whenever he dislikes or fears any of his subjects or covets their property, employs the "doctor" to accuse them of witchcraft, for which they are killed, and their cattle is seized by the chief. They practise circumcision, eschew pork as food, and have other customs similar to those of the Jews, from whom, some have supposed, they were borrowed; but similarity of climate, and other external circumstances, will produce similar habits in men. The Kafirs also abstain from eating fish, fowls, or eggs. They cultivate Indian corn, pumpkins, and a kind of millet. They chiefly live upon these articles and milk, eating little meat except in war time, when they freely kill their cattle. Their language is singularly soft and harmonious. Its structure is very peculiar and complicated. Its chief characteristic is, that the relation between words is

Kafiristan expressed by prefixes; those of the nouns and pronouns regulating those of the verbs and other parts of the sentence. The language has been reduced to writing, grammars formed of it, and the New Testament has been translated into it. The best grammars are those of Appleyard and Boyce of the Amaxosa Kafir. There is only one small grammar written in English of the Zulu Kafir—that by Dr Collenso, the bishop of Natal. It is, however, chiefly taken from the work of a Norwegian missionary, written in Danish.

It is almost impossible to form anything like a correct estimate of the Kafir population. We should think the Amaxosa, in all its branches, numbers not less than 200,000 souls. The Amatémbu, or Tambookies, may be about 70,000. The Amaconda and their neighbours about 90,000. The Kafirs of Natal are estimated at 100,000. The population of the Zulu and other Kafir countries it is impossible to estimate. (B. C. P.)

KAFIRISTAN, in Asia, a country adjoining the N.E. boundary of Afghanistan, and remarkable because, though surrounded by powerful and implacable enemies, it has never been conquered. The name Kafiristan, signifying "land of infidelity," has been given to the country by the neighbouring Mussulmans, in consequence of the rejection of Mohammedanism by the inhabitants. They are called Siyah Posh, or "black clad," from wearing black goat-skin dresses. The country is drained by four considerable rivers, the Kamar, Alingar, Alishang, and Tagoa, which fall into the River Kabool. It is situate between N. Lat. 35. 36, and E. Long. 70. 74.

KAIRA, in Hindustan, the principal town of the British collectorate of the same name, situate within the Presidency of Bombay, near the confluence of two small rivers, the Watruk and Seree. It is of considerable size, and surrounded by a wall with bastions. The streets are uneven and narrow, but the houses are substantial and lofty, with sloping tiled roofs, and a good deal of carving about the woodwork of their gables and verandahs. The district of which this place is the chief town has an area of 1869 square miles, with a population of 580,631 persons, inhabiting 138,958 houses. The tract was ceded to the East India Company by the Guicowar, under different treaties and engagements, commencing with the grant of the fort of Kaira, which was made over to the British in May 1803. The town of Kaira is distant from Bombay N. 265 miles. Lat. 22. 45., Long. 72. 41

KAIRWAN, a large town of Northern Africa, regency of Tunis, and about 80 miles S.S.E. of the city of that name. In extent and importance it ranks as the second city of Tunis, and by Mohammedans is regarded as the holy city of Africa. The great mosque, supported, it is said, by 500 marble or granite pillars, is esteemed the most magnificent, as well as the most sacred, in Barbary. Kairwan was founded by the Arabs about A.D. 670. It stands in a barren, sandy plain, and is surrounded by a low wall having four gates. The houses are generally good, and the streets wide, but there is a great deficiency of water. Yellow Morocco boots and slippers made here are famous for the beauty of their dye. Pop. about 50,000.

KAISARIYEH or **KAISARIAH** (anciently *Mazaca* and *Cæsarea*), an important commercial city of Asia Minor, pashalic of Caramania, situate in a plain at the N. foot of the Erjish Dagh (the ancient *Argæus*), 150 miles E.N.E. of Konieh. It is the entrepôt for a large extent of country, and the resort of merchants from all parts of Asia Minor and Syria. Besides cotton, gums, fruit, wine, furs, skins, wool, goats' hair, and the other products of its own territory, it trades in numerous articles of British and colonial produce, hardware, silks, woollens, indigo, dye-woods, &c. The chief articles of industry are cotton-thread and cloth, and yellow Morocco leather. The vicinity is fertile, and

the climate salubrious, but Kaisariyeh itself is the filthiest town in all Turkey. The streets are narrow and irregular, and the houses, though solidly built of stone and brick, have a mean and dilapidated appearance. Mazaca was the capital of Cappadocia, and when that kingdom became a Roman province in the reign of Tiberius, the name of Mazaca was changed to Cæsarea. In the later times of the empire it became a city of great importance, and is said to have had a population of 400,000 persons. The present population is variously estimated at from 8000 to 25,000.

KAISERSLAUTERN, a town in the Bavarian circle of the Palatinate, and capital of a cognominal district, stands on the Lauter, 34 miles W.N.W. of Spires. It was fortified as early as the middle of the twelfth century by the Emperor Friedrich Barbarossa, who also built the strong castle which was destroyed by the French in the war of the succession. Three engagements took place here in 1793–94, between the French and Germans, in which the latter gained some advantages. The town has manufactures of linen and woollen goods, leather, and paper; but is chiefly dependant upon its iron-works, which are supplied from mines in the vicinity. Pop. about 7000.

KALAMAIKA, a favourite Hungarian dance of a lively kind, in 3/4th time, consisting of two strains, each of four bars, and each repeated.

KALBE, a town on the River Saala, in the Prussian province of Saxony, and government of Magdeburg, 18 miles S. of the town of that name. It is noted for its manufactures of friezes, flannels, and hosiery. Pop. 5903.

KALEIDOSCOPE (*Kalós, beautiful, eidos, a form, and σκοπέω, I see*), an optical instrument, which, by means of two equal plane mirrors inclined to each other at a certain angle, and placed in a particular manner relative to the eye and object, is used, as its name imports, to produce and to exhibit beautiful forms. It was invented in 1814 by Sir David Brewster while experimenting on the polarization of light; and ere the inventor had time to secure it by patent unprincipled opticians made kaleidoscopes by thousands, and sent them to all parts of the world. Sir David Brewster states that no fewer than 200,000 of these instruments were sold in London and Paris in the space of three months; and yet, he says, that out of this immense number, there are, perhaps, not one thousand constructed upon scientific principles, or capable of giving anything like a correct idea of the power of the kaleidoscope; and of the millions who have witnessed its effects, there are perhaps not one hundred who have any idea of the principles upon which it is constructed, and of the mode in which its effects are produced.

In order to produce its effects, the instrument may be said to depend on the principle of a repetition of the reflections of an object situate between

Fig. 1.

two plane mirrors inclined to each other at a certain angle; or, more particularly, if two reflecting planes form a section with each other, then the reflections of an object between the planes will all be found in the circumference of a circle, the centre of which is the projection of the intersection of the planes, and the number of images will be such as will exactly complete the circle. This will be more easily understood from fig. 1, where AC

Kaleidoscope.

BC, are the orthogonal projections of two plane mirrors, C the projection of their line of junction, and P the position of a luminous point or object within the angle ABC, made by the reflecting planes; then from centre C and radius equal to CP, describe a circle AB. It is clear that we shall have two series of virtual images which will be all ranged round the circumference of the circle AB; for the rays of light, and, therefore, a perpendicular ray from P, regarded as a luminous point, will have a virtual image P_1 , an image of itself on the other side of the plane BC, and as far distant from that mirror as P is. But the bright image P_1 , letting a perpendicular ray fall on the mirror AC, has a virtual image P_2 as far distant from AC as P_1 is; P_2 is also a luminous point, and has its image at P_3 in the mirror BC *produced*, and at the same distance from it as its focus P_2 ; the last repeated reflection of P is caused by the bright point P_3 being seen at P_4 , its virtual image behind and as far from the mirror AC *produced* as P_3 . If we make a similar construction for a ray of light emanating from the focus P upon the mirror AC, the virtual image of P will be Q_1 , which will also produce Q_2 as its image, and so on, till at last we arrive at Q_4 . Now, since the bright images P_4 and Q_4 are at the *back* of both reflecting planes produced, they can suffer no reflection; therefore, the repeated reflections of P in the two mirrors are P_1, P_2, P_3, P_4 and Q_1, Q_2, Q_3, Q_4 , and they are, by Euclid 3. III., points in the circumference. Now, since these points are the respective foci of these perpendicular rays, they will also be the foci of all the rays diverging from their respective points, and, therefore, will form perfect images of the object between the mirrors.

Suppose, now, that instead of having the mirrors perpendicular to the plane of the paper (fig. 2) they have an inclina-

Fig. 2.

tion to each other, and have on the inner edges of AC, BC, one or both, small bits of vari-coloured glass; and if the system of mirrors be inclosed in a case blackened on the inside, then an eye placed at c will see a gorgeous and symmetrical pattern or picture. If the instrument be turned to different parts of the room, the pieces of glass remaining as before, the light will fall on the other portions of the coloured glass, and consequently produce a different pattern. This was the first kind of kaleidoscope which Sir D. Brewster made. It occurred to him some time afterwards, that the pattern might be varied by a motion or change of position in the objects reflected by the mirrors; the coloured glass or other objects were therefore placed between two plates of very thin glass, which formed, as it were, an object-glass; and being held in the hand, could be moved about at pleasure. The kaleidoscope was still further improved by making the object-plates circular, while a motion took place round the axis of the tube, or by sliding the object-plate in a groove, the object being placed in a cell of the reflectors.

The principal parts of the kaleidoscope, then, are the two mirrors (fig. 2) ACca, BCcb; which should be from 6 to 10 inches in length, and from 1 to 1½ inches broad at the end ABC, but about half this breadth at the end abc. These mirrors are kept apart at their upper, and united along their lower edges Cc, so as to form the solid angle

Fig. 3.

ACcb, and which must be some measure of 4 right angles, or 180°. The planes, which must always be free from dust, are placed in a tube, as in fig. 3; but the end ab is covered, and a small eye-piece affixed, so that the eye may take in the field of view ACB. It is of importance to have the angle of the mirrors as accurate as possible, for any deviation from the even angle will be immediately perceived by the eye. If the angle be a little larger than it should be, the image is deficient, and in some parts irregular or non-symmetrical; if the angle be a little smaller than it should be, the image is redundant, from a reduplication of one part. Sometimes portions of the images overlap and interfere with each other; but on the angle of the mirrors being rectified, these double images coalesce and form one image perfectly symmetrical in all its parts. The angles, therefore, which the mirrors of a kaleidoscope must make with each other are such as the following:— $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \frac{1}{6}, \frac{1}{8}, \frac{1}{10}, \frac{1}{12}, \frac{1}{15}, \frac{1}{18}, \frac{1}{20}, \frac{1}{24}, \frac{1}{30}, \frac{1}{36}, \frac{1}{40}, \frac{1}{45}, \frac{1}{48}, \frac{1}{60}, \frac{1}{72}, \frac{1}{80}, \frac{1}{90}, \frac{1}{100}, \frac{1}{120}, \frac{1}{144}, \frac{1}{160}, \frac{1}{180}$, &c., of 180°; or 90°, 60°, 45°, 36°, 30°, 18°, 15°, 12°, 10°, 9°, &c. Whatever part, therefore, the angle ACB is of 180°, the same will be the number of times the image is reflected or repeated in the mirrors. If, in fig. 1, ACB were an aliquot part of 180°, then the images P_4, Q_4 would form a single image; but when this is not the case, a want of symmetry will be perceived. It is important also that the line of junction cC of the mirrors (fig. 2) be of the finest possible kind and free from chips, for, otherwise, an imperfection will take place in the image. The planes, which have been previously blackened on the back, may be kept together at the proper angle by means of a piece of cloth glued on to their non-reflecting surface, so that they may fold in and out like the leaves of a book. By this contrivance the mirrors may be adjusted to the proper inclination, but chiefly by directing them to any line, or the straight edge of any object in contact with the broad ends, and very obliquely situate with respect to the edge of either of the mirrors; then looking through the instrument at one end, if the image be symmetrical with respect to its pattern, we may be sure that the planes are accurately inclined. The mirrors are now to be carefully set in the hollow tube which is to receive them; and the arrangement of a piece of cork or wood (c. g.) at the back of the mirrors must be such that the angle of inclination will remain unaltered. The remaining side ABda of the hollow prism made by the planes (fig. 2) may be effectually closed up by a piece of black velvet glued to the back part of the mirrors. The object-case of the instrument at the farther end from the eye is made up of two pieces of thin glass, kept separate by a brass rim about $\frac{1}{4}$ th or $\frac{1}{6}$ th of an inch broad; the intervening hollow part contains the objects which are to be reflected. This case is seen in fig. 3, and at the wide end of the mirrors to which it is to be affixed. The end ABC of the planes (fig. 2) is in fig. 3 represented by abcd; mn is a brass ring, which moves easily upon the tube, and rests steadily in its place; MN is a brass cell, slipping tightly on the moveable ring mn. The objects are placed in a case, one of the glasses of which is transparent, and the other ground; the brass rim separating them should consist of two pieces, the one screwing into the other, so that the objects in the case might be unscrewed and changed at pleasure. The object-box is placed at the bottom of the cell MN, as at OP; and the depth of the cell is such as to allow the side O to touch the end of the mirrors when the cell is slipped upon the ring mn. It is an essential condition that the objects be as near as possible to the plane ABC of the mirrors. The objects employed for reflection are various; but generally small pieces of transparent coloured glass, occupying a certain portion of the interval between the mirrors, produce at times the most splendid patterns. Wires of glass also, both spun and twisted, different in colour and form, may be intermixed with larger masses of coloured glass, beads, bugles, fine needles, metallic wires,

Kaleidoscope.

Kaleido-
scope.

lace, seaweed, looped figures and letters (as 8 and S), circles, ovals, spirals, triangular lines, varnish, indurated Canada balsam, &c.; the case, however, must not be too crowded with objects, so as to interfere with each other's motion.

The patterns produced are of the most gorgeous description, and sometimes defy imitation; the pictures of the images are best comprehended by looking into the instrument itself. When objects are to be looked at which are not in the case, they must be held as near as possible to the object end; such objects are generally viewed as through a microscope, the light falling very strongly upon the object.

The simple kaleidoscope has, as we have seen, two mirrors, but on the same principles as above, we may construct one with 3, 4, 5, &c., or any number of reflecting planes, and which will repeat images in endless succession on every side. Such optical instruments are termed *Polycentral Kaleidoscopes*. But where symmetry and regularity of form are required, the polycentral kaleidoscope is confined within narrow bounds; for the angles of the several reflecting planes with each other must be an aliquot part of 180° . Thus, if the kaleidoscope have three mirrors, the angles, in order that a perfect image may be produced by each angle of the prism, must be 60° , 60° , 60° ; or 45° , 45° , 90° ; or 30° , 60° , 90° . When the reflecting planes are equilateral, and, therefore, have each side making an angle of 60° with each other, the instrument is termed the *Triangular Kaleidoscope*, from the triangular symmetry which the images present, the images of each plane being combined in groups of three together in every part of the pattern. When we have an isosceles right angled triangular prism, and, consequently, with angles of 45° , 45° , 90° , the pattern produced is regularly divided into square compartments, and therefore this disposition of the mirrors has received the name of *Tetrascope*. When the polycentral kaleidoscope has its angles of 30° , 60° , 90° , the pattern produced is hexagonal, and the symmetry is very conspicuous, especially with reference to that centre round which are congregated the greatest number of repetitions caused by the angle of 30° . This disposition of the reflecting mirrors is termed a *Hexascope*. Of these the last two kaleidoscopes are of use to the draughtsman, in affording him the best material for his designs.

The principal advantage which the polycentral has over the simple kaleidoscope is, that the former has a greater field of view than the latter. Were no loss of light to arise from repeated reflections, the field of view would be infinite; but since each reflected ray is not so intense as its corresponding incident one, a diminution of light takes place from repeated reflections. The effects of polarization also increase the loss, but more from this cause in the polycentral than in the simple kaleidoscope; hence metallic specula are preferred to the best of glass mirrors. The number of reflections required, in order to obtain any great extent of *spectrum*, that is, the whole appearance in the kaleidoscope, being greater than in the ordinary kinds of simple kaleidoscopes, the instrument must be of greater length comparatively with the breadth of the mirrors, as in this way the course of the rays will be more oblique with respect to the mirrors, and a larger portion of light will reach the eye. A greater obliquity is also obtained with the same proportion between the length and breadth of the mirrors, by making them taper at the end next the eye.

We may add, also, that of four-sided kaleidoscopes, those which can give perfectly symmetrical forms are the square and rectangle, where all the angles are right angles.

We may repeat here the conditions necessary for the kaleidoscope producing perfectly symmetrical images. 1st, The angle of inclination of the mirrors must be an *even* or *odd* aliquot part of 180° , or 360° , when the object is regular and similarly situate with respect to both of the mirrors; or an even aliquot part of 180° or 360° , when the object is

irregular. 2d, That out of an infinite number of positions for the object, both within and without the reflectors, there is only one position where perfect symmetry can be obtained, viz., by placing the object in *contact* with the ends of the reflectors, or between them. 3d, That out of an infinity of positions for the *situation of the eye* there is only one where the symmetry is perfect, viz., as near as possible to the angular point, so that the whole of the circular field can be distinctly seen; and this point is the only one at which the uniformity of the reflected light is the greatest. When these conditions are properly attended to, the pictures produced in the field of view are beautiful beyond description, and present an endless variety of symmetrical combinations, never recurring a second time when the objects have been displaced by a slight vibration, or by turning the instrument on its axis.

In order to extend the power of the instrument, and to introduce into symmetrical pictures external objects, whether animate or inanimate, Sir David Brewster very ingeniously substituted a double convex lens L (fig. 4), for

Fig. 4.

the case of objects between the circular glass plates, by means of which the second condition for symmetry in kaleidoscopes can be fulfilled. This lens L formed at F between the mirrors an inverted image of the object R; and this image is multiplied by the reflecting planes, and forms a symmetrical spectrum precisely in the same way as if a real object of that size had occupied its place. The lens L may be placed in or at the mouth of one tube, while the reflecting planes are accurately placed in another, so that by pulling in or pushing out the tube next the eye, the images of objects at any distance can be formed at the place of symmetry. Thus may flowers, trees, animals, pictures, busts, &c., be introduced into symmetrical combinations. A blazing fire gives the appearance of beautiful fireworks. Such a disposition of the mirrors and the lens is a *Telescopical*, or *Compound Kaleidoscope*. If the distance of F from the eye-piece be less than that at which the eye sees objects distinctly, a convex lens must be placed before the eye, so as to give distinct vision of the objects in the picture.

The images produced by the kaleidoscope may be exhibited to an assembly of spectators at the same time by placing the flame of a lamp between a spherical reflector and a convex-plane lens, the latter of which concentrates the rays, and, being next the instrument, throws a flood of light upon the object-case; the picture is projected on the opposite wall through a double convex lens placed at the eye end. The lamp may be replaced by a jet of oxygen.

The beautiful designs produced by this simple instrument may be copied by means of the *Camera obscura*, but more successfully traced by using a *Camera lucida*.

Instead of employing reflecting surfaces, Sir David Brewster tried the effect of solid prisms of glass, and obtained in this way a total, instead of a partial, reflection of light. It is difficult, however, even to make these prisms free from veins or bubbles, and also to obtain a perfect junction of the planes.

Simple kaleidoscopes have been variously constructed, with reference to the angles of inclination of the mirrors, Brewster's *Polyangular Kaleidoscopes* are so constructed that the angle of the mirrors may be varied at pleasure, by allowing the reflecting surfaces to move on their connecting edges as on a hinge, and thus to open or close at pleasure by means of a screw. Others, again, admit of the mirrors entirely separating, so as gradually to become parallel to

KALENDS. See CALENDAR.

KALISZ, or KALISCH, a city of Russian Poland, capital of a province of the same name, situate on an island in the Prosna, close to the Russian frontier, and 130 miles W. by S. of Warsaw. It is surrounded by old walls, flanked with towers, and entered by five gates. Kalisz is considered one of the finest cities of Poland; its streets are wide and well paved, and the houses are generally good. Among its public buildings are the citadel, founded by Cassimir the Great, the former palace of the Voivodes, now occupied by the courts of justice, the cathedral, church of St Nicholas, and the Lutheran church. There are six Roman Catholic churches, five convents, a Jewish synagogue, theatre, several hospitals, Roman Catholic gymnasium, with fine library, and extensive scientific collections, and a military school. Kalisz was founded about the middle of the seventh century, and was long the residence of the dukes of Great Poland. Pop. (1854) 11,778.

KALLEENJUR. See CALLINGER.

KALOCSA, or KOLOCSA, a town of Hungary, near the left bank of the Danube, 67 miles S. of Pesth. It is the see of an archbishop, and has an ecclesiastical lyceum, piarist college, gymnasium, and an old castle, now the archiepiscopal palace, containing a fine library of upwards of 30,000 volumes. Pop. (1851) 11,000.

KALUGA, a government of European Russia, bounded W. and N.W. by Smolensk, N.E. by Moscow, E. by Tula, and S. by Orel, and lying between N. Lat. 53. 20. and 55. 20., and E. Long. 33. 20. and 37. Area 12,178 square miles. The surface is an almost uninterrupted flat, and the soil is usually of a sandy, or hard clayey nature, requiring a large quantity of manure to render it moderately fertile. About two-fifths of the government are arable, and more than one-half of it is covered with forests. It is well watered with numerous rivers and streams, the principal of which are the Oka and its tributaries. There are also several lakes and marshes in the central and western parts of the government. The climate is considered mild for Russia; winter usually sets in about the end of November, and disappears by March. The principal crop is rye, but oats, wheat, and barley are also largely grown, as well as hemp and flax. Cattle are not numerous, but a considerable number of horses are bred. Neither game nor fish are abundant. The mineral products are bog iron-ore, millstones, lime, and gypsum. This government being naturally unsuitable for agriculture, the attention of its inhabitants has been chiefly directed to the manufactures, and in this respect Kaluga ranks immediately after Moscow and Vladimir. The chief manufactures are iron, brandy, sail-cloth, linens, woollens, calicoes, silk-velvet, ribands, leather, paper, and glass. Pop. (1851) 941,402.

KALUGA, the capital of the above government, is situate on the right bank of the Oka, 95 miles S.W. of Moscow. Though consisting of not more than 4000 houses, it is said to be nearly 7 miles in circumference. It is surrounded by a rampart, which has been formed into a public walk. The houses are chiefly wooden, and the streets narrow, crooked, and dirty. There are, however, some good public edifices,—as the government-house, town-hall, theatre, and several of the churches. Besides carrying on an extensive trade, it manufactures largely sail-cloth, woollens, cottons, leather, sugar, hats, &c. Pop. (1851) 29,580.

KAMA, a large river of European Russia, the principal affluent of the Volga. It rises in the government of Viatka, N.E. of Glazov, flows first N. and then N.E. into the go-

vernment of Perm, where it takes a S.W. direction; it afterwards separates the government of Viatka from those of Perm and Orenburg, and, entering Kasan, joins the Volga, after a course of more than 100 miles. One of its affluents is connected with an affluent of the Dwina by a canal 12 miles in length, thus establishing water communication between the White Sea and the Caspian.

KAMINIETZ, or KAMENEZ, a town of Russian Poland, capital of the government of Podolia, on the Smotritza, at a short distance from its junction with the Dniester. It was formerly the strongest bulwark of Poland on the side of Turkey. Its walls were levelled by order of the Russian government in 1812, and it is now defended by a citadel and a detached fort. The streets are narrow, crooked, and dirty, and the houses are generally of wood. There are, however, some handsome public buildings, among which are the two cathedrals and several of the churches and the government offices. Kaminietz is the seat of a Greek archbishop, and of a Roman Catholic bishop. It has some manufactures, and a considerable trade. Pop. (1851) 17,109, one-half of whom are Jews.

KAMISHIN, or KAMYSCHIN, a walled town of Russia, government of Saratov, on the Volga, at its junction with the Kamyschinka, which flows through the town. It has large salt magazines, water-mills, and tallow factories; and carries on a considerable trade in agricultural produce. Pop. (1851) 7651.

KAMTSCHATKA, a large peninsula of Asia, projecting from its N.E. coast in a southern direction for about 800 miles from N. Lat. 62. to 51., and between E. Long. 155. and 165. It forms part of Russian Siberia, and is bounded on the N. by the country of the Tchuktchi, E. by the Sea of Kamtschatka, S. by the North Pacific Ocean, and W. by the Sea of Okhotsk. From Cape Lopatka, its southern extremity, it gradually increases in breadth to the middle, where it is about 250 miles across; and N. of this its breadth averages from 80 to 150 miles. A chain of lofty and rugged mountains traverse the peninsula from N. to S. through its entire length. Many of the peaks are active volcanoes, and they are considered to form the northern extremity of a great volcanic chain continued through the Kurile and Japanese islands and the Philippines. On the eastern side the mountains approach close to the coast, which is rocky and precipitous, with numerous bold promontories and inlets. The western coast is low and sandy, with no elevations for 25 or 30 miles inland. The principal elevations, proceeding from S. to N., are Awatchinskaja, 8760 feet above the sea; Korjaskaja, 11,215; Japanowa, 9060; Kronolzkaja, 10,625; Kliutschewskaja, 16,512; and Schiwelutschkaja, 10,590. The general formation of Kamtschatka is igneous; comprising porphyry, jasper, trap, granite, &c; the W. side, however, belongs to the secondary and tertiary formations. The only river of importance is the Kamtschatka, which is said to be 300 miles in length, and to be navigable for vessels of 100 tons for 150 miles.

The climate is very severe, but is much milder than that of Eastern Siberia. Winter continues for seven or eight months in the year. Spring is the finest season, the summer being extremely disagreeable owing to the frequent rains and heavy fogs which settle on the land. The greatest heat is in July. The frost begins to set in about October, and usually continues till May. In the middle of winter the temperature averages about 14° Fabr.; but in severe frosts it sometimes falls as low as -15°, or even lower. From the severe and variable nature of the climate, and the rocky nature of the country, the vegetable productions are of little value. Forests of considerable extent occur, consisting of several species of birch, pine, poplar, and willow; but these are all stunted in their size. Shrubs are plentiful, and so are wild berries and wild garlic. In some few favoured

Kaminietz
||
Kamtschatka

Kanawha spots the Russian settlers succeed in raising wheat, barley, rye, oats, potatoes, turnips, radishes, &c. The wild animals, which were formerly very abundant, have been much thinned by the hunters. They comprise bears, wolves, foxes, reindeer, mountain sheep, beavers, and otters. Wild fowl are still plentiful; but it is on fish, which abound everywhere, that the inhabitants chiefly depend for subsistence. The dogs of Kamtschatka are much valued, and are trained to perform many useful operations. The trade of the country is very limited. There is no equitable system of taxation, and the Russian governors, at such a distance from the capital, have few checks on their cupidity. The people thus labour only to supply their daily wants. Furs and dried fish are exported from Petropaulowsky; the imports are rice, flour, coffee, sugar, brandy, and whisky.

The natives of Kamtschatka consist of two tribes,—the Kamtschatdales and Koriaks, who differ from each other more in mode of life than in physical conformation. They are in general of low stature, with broad shoulders, a large head, and short legs. They have scarcely any beard, their face is long and flat, eyes small and sunken, lips thin, and hair lank and black. Their features seem to identify them with the Mongolian race. They are mild and hospitable, but at the same time filthy, lazy, and sensual in the extreme. Notwithstanding the severity of the climate, they are subject to few maladies, and generally reach an advanced age.

The Kamtschatdales occupy the southern part of the peninsula to about 58° of N. Lat.; while the country N. of that is occupied by the Koriaks. The former have fixed habitations, and employ themselves in fishing and hunting. During the summer or fishing season they leave their winter residences for the places which they use for drying fish. The summer is thus occupied in providing food for the winter, in which their only employment is the chase. Their winter habitations are sunk some feet under the ground for the sake of warmth, the walls formed of trees laid over each other and plastered with clay, and the roof slanting, and covered with coarse grass or rushes. The summer house is raised to the height of 12 or 13 feet from the ground by means of posts, in order to afford them a sheltered space to dry their fish. The Koriaks are a wandering, nomadic tribe, subsisting on the produce of their numerous herds of reindeer. The whole population of the peninsula is said not to exceed 5000, of whom about one-third are Russian settlers or their descendants.

Kamtschatka was first visited, in 1649, by some Russians, who were wrecked on the coast. They lived in peace with the natives for some time, but afterwards, quarrelling among themselves, were all murdered. It was not till 1696 that a body of Cossacks from Anadirsk penetrated into the country; and from that time a series of hostilities were maintained against the natives till 1706, when they were completely subjected to Russia.

KANAWHA, a river of the United States of North America, rising in the N. of North Carolina, and flowing in a N.N.W. direction through Virginia to its mouth in the Ohio, at Point Pleasant, 252 miles below Pittsburg. It is about 300 miles in length, and is navigable for steamers to Charleston, 60 miles from its mouth.

KANDAHAR. See **CANDAHAR**.

KANDY, a city of Ceylon, near the centre of the island, and about 65 miles E.N.E. of Colombo. It was the capital of the kings of Kandy till 1815, when it came into the possession of the English. The town stands on the margin of an artificial lake, and is almost surrounded by an amphitheatre of steep and lofty hills. Since 1815 many good buildings have been erected, and several streets formed; but the ordinary dwellings are mere mud huts. The royal palace, once a building of great magnificence, has been in a great measure allowed to fall into decay. See **CEYLON**.

KANGAROO ISLAND, a large island of South Australia, at the mouth of the Gulf of St Vincent, in S. Lat. 36., E. Long. 137. It is 95 miles in length from E. to W., and, with the exception of a narrow portion at its eastern end, is about 25 miles wide. Area estimated at 1970 square miles. The surface is for the most part covered with brushwood, with here and there clumps of trees. It contains numerous salt lakes. It was discovered by Capt. Flinders, and received its name from the number of kangaroos found on it.

KANGRAH, an extensive hill fort of the Punjab, situated to the S.W. of the Himalaya Mountains, between the Beyah and the Rauvy rivers. The country is covered with wood. The fortress, which is situated in the northern part of the province, has long been celebrated. It was taken, A.D. 1010, by the famous Mahmoud of Ghizni, who plundered it of immense riches. It was retaken by the rajah of Delhi in 1043; and afterwards by the Emperor Akbar, after a very long siege, who conferred it on one of his officers, with the adjoining district. About the beginning of the present century it belonged to Sansa Chand, who ultimately surrendered it to Runjeet Singh. When the Punjab became a British possession, the vicinity of Kangrah was selected as one of the localities for the culture of the tea tree. The experiment was eminently successful, and an extensive plantation now covers the base of the Chumba range of hills. The fort of Kangrah is in Lat. 32. 5., Long. 76. 18.

KANO, a town of Houssa, Central Africa. See **HOUSSA**.

KANOGE, a town and district of Hindustan, in the province of Furruckabad. The district extends along the E. side of the Ganges, and is generally of a sandy soil, though well cultivated. The town is of great antiquity and celebrity, about 2 miles distant from the Ganges, with which it communicates by a canal. It was in former times of much greater extent and magnificence; and for an extent of about 6 miles the small pieces of brick which are seen on the spot, and the occasional traces of building, mark out the site of the ancient capital of Hindustan. The town at present consists of but one street; there are no buildings of any consequence; and the brick walls, which appear of no great antiquity, are going rapidly to decay. The adjacent plain is covered with ruined temples and tombs, and everywhere broken images are seen lying under the trees. The most curious remains of antiquity are often found amongst the ruins, such as ancient coins inscribed with Sanscrit characters, and sometimes with the figure of a Hindu deity on one side. Kanoge was the capital of a powerful empire which existed at the period of the Mohamadan invasion. It was conquered, though not permanently retained, by Mahmoud of Ghizni, A.D. 1018. The distance from Agra is 110 miles; from Lucknow, 75; from Delhi, 214; and from Calcutta, 650. N. Lat. 27. 5., E. Long. 79. 59.

KANSAS, a territory of the United States of North America, lying between N. Lat. 37. and 40., and W. Long. 94. 25. and 107. 20., and bounded on the N. by the territory of Nebraska, E. by the state of Missouri, S. by the Indian and New Mexico territories, and W. by the main chain of the Rocky Mountains which separates it from the territory of Utah. Kansas may be said to constitute the territorial centre of the vast continent of North America, being about equally distant from the Atlantic on the E. and the Pacific on the W., from Hudson's Bay on the N. and the Gulf of Mexico on the S. It is about 800 miles in length from E. to W., by 208 in breadth from N. to S., and has an estimated area of 114,798 square miles. The surface of the country presents a gradual inclination from the base of the Rocky Mountains to the frontier of Missouri. It has no mountains, properly so called, except on its western borders. A series of hills or ridge-like elevations traverse the entire territory from

Kangaroo

Kansas.

Kansas.

W. to E. between the waters of the Kansas and Arkansas. The eastern portion of Kansas, extending W. from the Missouri about 200 miles, consists of an undulating country, with a rich and fertile soil, well watered, and having a large amount of good timber. The streams flow through fine picturesque valleys, and are generally bordered with timber for a quarter or half a mile. The face of this part of the country, with its climate, soil, and productions, corresponds generally with that of Western Missouri. The middle portion of Kansas is more level, the depressions are shallow, long, and gradual, timber less abundant, the streams not so frequent, and the country in general is not so well adapted to sustain a large population as the more eastern part. This portion extends W. of the former for probably about 200 miles, and includes part of that great belt of desert extending from the 47th deg. of N. Lat. southward to New Mexico. Good grasses, however, are found in many places, and ultimately much of it may be found suitable for grazing. That section of the country lying along the eastern slope of the Rocky Mountains is represented as one of great beauty. It is well supplied with timber, and well watered by numerous streams winding in various directions between gently sloping hills and ridges richly covered with grass. Over these hills, and on the broad plains at their bases, buffaloes range in thousands, feeding upon the bunch and buffalo grasses with which this district is densely covered. It is said that few countries in the world are better suited for grazing, have a finer climate, or more interesting scenery than this portion of Kansas.

The principal river within the territory is the Kansas or Kaw, one of the largest affluents of the Missouri. It rises by two large forks, which have their sources near the eastern base of the Rocky Mountains, and flowing eastward, mostly at a considerable distance from each other, unite their waters at Fort Riley, where the Kansas proper commences. Republican Fork, the more northern and longer of the two, issues from Lake Kansas, and has as its principal affluents First Creek, Prairie Dog Creek, and Sandy Creek, all on the right. The chief affluents of Smoky Hill Fork are the Solomon Fork, and the Grand Saline Fork, both on the left. The Kansas is about 1200 miles in length from the source of the Republican Fork, and is navigable for steamers as far as the junction of its two great forks, if not farther. The principal of the other streams watering this territory are the Osage and the Arkansas, with its tributaries the Neosho, Verdigris, Little Arkansas, and Red Fork. The Missouri forms part of its eastern boundary, and affords it a ready outlet for its productions. In the great Kansas valley below Potawatomie, and in the eastern region along the Missouri, there are some of the finest hemp lands in the world. Wheat, corn, oats, and vegetables grow as well there as in any of the western states. The winters are generally dry and pleasant. Little snow falls, and even then lies on the ground only for a short time. The summers are long and warm; while on the high lands the heat is generally fanned by refreshing breezes. Ploughing commences in January; much rain falls from March to June, and the months of August, September, and October are dry and pleasant. The trees are chiefly oak, walnut, ash, hickory, mulberry, hackberry, linden, and cotton-wood. Some 40 miles up the Smoky Hill Fork an extensive bed of gypsum has been found, specimens of which have been tested and found to be of superior quality. Salt is also alleged to be very abundant on the Saline Fork. Specimens of coal, both bituminous and anthracite, and of tin, lead, and iron ore, have been found.

In 1854 a bill was introduced into Congress for forming that extensive tract of country then known as Nebraska, and which formed part of the Louisiana territory purchased from the French in 1803, into two territories, Nebraska and Kansas. This has again led to the agitation of the slavery

Kansas.

question, which has so frequently occasioned disputes between the Northern and Southern States. On the admission of the state of Missouri as a member of the Union in 1820, this question was fiercely debated, the House of Representatives having passed a resolution that it be admitted only as a free state, but in this the Senate refused to concur. At length a compromise was effected, the House of Representatives consenting to Missouri being a slave state, on condition that slavery shall be prohibited in all those states that may subsequently be formed out of that portion of the Louisiana purchase lying N. of N. Lat. 36. 30. In terms of this compromise, Nebraska and Kansas could be admitted into the Union only as free states; but, notwithstanding this, the pro-slavery party maintained that the first population of a territory have alone the right to determine the political and social institutions of that territory, and, in accordance with this, an act was passed, declaring that whether these shall subsequently be admitted into the Union as slave or free states shall be determined by the voice of the inhabitants at the time of their admission. This partial success served only to incite the pro-slavery party in the United States to farther exertions, and slaveholders from the Southern States flocked to Kansas in great numbers, while, on the other hand, emigration societies were formed in various parts of the Northern States for the purpose of forwarding to it colonists holding anti-slavery principles. Nor is this all, the neighbouring state of Missouri has taken an active part in the struggle. The Missourians crossed the border in immense numbers on election days, to swell the votes of the pro-slavery party, and they even had recourse to intimidation and force to restrain the "free soilers" from voting. Judges who refused to receive their votes, without administering the oath as to residence in the territory, were expelled, and others of the Missourians appointed. These are known as the "border ruffians," and are the most dangerous class in the territory, having frequently recourse to bloodshed and murder to accomplish their purposes. It is evident that the legislature thus elected would represent the opinions of Missouri rather than that of Kansas. In terms of two conventions of delegates representing the people of Kansas, and repudiating all the acts of the so-called territorial legislature, an election was held on the 4th day of October 1855, for choosing members of a convention to form a state constitution, preparatory to application for admission as a state of the Union. The number of delegates was fixed at fifty-two, and no non-resident, and no one who had not been resident for thirty days, was allowed to vote. The constitution adopted by these delegates was one eminently republican in its character, and embracing the views of the majority in the territory, by whom it was ratified. On the 9th of April 1856, a bill was presented to the Senate of Washington for the admission of Kansas as a state into the Union, and the debate on the question is memorable on account of a brutal attack made upon the Honourable Charles Sumner by Mr Brooks, a member of the House of Representatives for the slave state of South Carolina. The president and the executive manifested their sympathies in favour of the slavery party, and under the plea of preserving peace, are charged with supporting the movements of the "border ruffians" by the federal troops. On the eve of the adjournment of last Congress (1856) the feeling was so strong against the President for thus supporting the slavery party, that the House of Representatives threatened to stop the supplies, and it was with great difficulty that the executive were able to secure a majority of three. For the later history we must refer to the article UNITED STATES.

In terms of the act passed in 1854, Kansas was divided into eighteen districts, and was found to contain a population of 8521 persons, of whom 5138 were males, and 3383 females. The number of slaves was 192. This was in the

Kansuh
||
Kant.

eastern part; the central and western parts being still in the possession of the wandering tribes of Indians, of whom it is estimated that there are about 25,000 in the territory. The chief town, Leavenworth, on the Missouri, is estimated to contain a population of about 1500.

KANSUH, the most N.W. province of China, lying between N. Lat. 32. 30. and 40., and E. Long. 98. and 108., and bounded on the N. and W. by Mongolia, into which it projects a long tongue of land, E. by Shen-si, and S. by Shen-si and Szuchuan. The surface is mountainous, some of the peaks rising to more than 10,000 feet above the level of the sea. The principal river is the Hoang-ho, or Yellow River, which flows in an easterly direction through the province. The climate is rather cold; and the soil in general sterile. Wild animals abound, and large flocks of cattle are kept in the province. The capital is Lan-chou. Pop. about 16,000,000.

KANT, IMMANUEL, the greatest metaphysician of the eighteenth century, was born at Königsberg, the chief city of Eastern Prussia, on the 22d April 1724. His father, John George Cant, was the son of a Scottish emigrant, who, according to the testimony of the philosopher himself, had left Scotland about the end of the seventeenth century, when a considerable influx of Scotsmen took place into the Prussian territories upon the Baltic, as is proved by the names of their descendants, Douglas, Simpson, Hamilton, &c., which survive to this day. Kant's grandfather, in regard to whose profession or original residence in Scotland nothing is known, settled ultimately at Tilsit, but seems to have halted for a time at the seaport of Memel, near which the father of the philosopher was born. This individual removed at a very early period of his life to Königsberg, where he learned the trade of a saddler, and carried on a small business in that department, working at the same time with his own hands. In his character, though in comparatively humble life, the hereditary intelligence and piety of the Scottish stock were conspicuous; and he found a like-minded associate in a wife, of German blood, Anna Regina Reuter, who possessed a mind far above her station, and religious sensibilities of the liveliest nature. To the virtues of his parents Kant ever delighted to bear honourable testimony; and the image of his mother in particular, to whom he bore a marked resemblance, was indelibly impressed upon his mind. He was the fourth of eleven children, of whom most died in infancy, and none, besides himself, attained to any distinction. His parents, whose income was barely sufficient to raise them above debt, zealously exerted themselves for the education of their children; and as Kant displayed the most hopeful talents of the family, though he accuses himself of sloth and truancy, it was early resolved to train him for some learned profession. That to which he was first destined was theology. At ten years of age, he was entered in the Frederick's College, a classical seminary, then under the presidency of Dr Schultz, one of the city clergy, and an excellent man, whose religious strictness exposed him to the charge of pietism, notwithstanding that he was an eminent disciple of the philosopher Wolff, and a professor in the university. Under the influence of these views, to which his parents were also most earnestly attached, the youthful Kant was trained; and though he afterwards renounced the doctrines of his instructors, their moral impression was apparent to the last in the purity of his life, and the elevation of his ethical system. The seven years of his course in the gymnasium were chiefly marked by his zeal for the classics, in which the great philologist Ruhnken was his fellow-student. Towards metaphysical pursuits he showed at this time absolutely no tendency. In the year 1740 Kant entered

Kant.

the university of Königsberg as a theological student, in which character he preached occasionally in the neighbouring country churches. He soon, however, abandoned this course, apparently from some change in his views of doctrine, and devoted himself to the mathematical and physical sciences, but without as yet manifesting any taste for philosophy. He mastered with eagerness the higher mathematics of Newton; and his whole subsequent writings bear deep traces of his familiarity with this study. During the last years of his university career, the straitened circumstances of his father, his sole surviving parent, compelled Kant to have recourse to private teaching of the humblest kind in the town of Königsberg, till, in 1746, his father's death dispelled for the time his hopes of ultimately obtaining some place in the university, and obliged him to seek employment as a domestic tutor at a distance. In this position he spent nine of the best years of his life, from 1746 to 1755, exchanging one family for another, and at last returning in that of a nobleman of the name of Kayserling to his favourite Königsberg. The lady of this house seems to have discovered his extraordinary qualities, which were not unnoticed in other families; and in spite of Kant's own complaint that this mode of life was his necessity and not his choice, it certainly enlarged his knowledge of the world, and added to his other accomplishments the grace and polish of refined society, which he displayed ever afterwards to a degree somewhat unusual in a philosopher by profession. In 1755, Kant, having returned to the university, obtained the standing of a private lecturer, on entering which office he delivered two theses—one *de igne*, another on the first principles of metaphysical science.¹ Fifteen weary years passed away in this obscure station, during which he lectured over almost the whole encyclopedia of human knowledge, but with a prevailing fondness at first for the physical sciences, to which philosophy was rather subordinate. A favourite course with him was physical geography; and this retained its place when other topics of his early years were laid aside. He became almost from the first a popular lecturer, and was often called upon to deliver special courses to persons of distinction, while, at the same time, his class-room was filled with amateur students, many of them in the prime of life. While thus active in his public duties, he continued to publish, at irregular intervals from 1755 to 1770, a series of essays and treatises, which all bear the stamp of his great powers, but only dimly foreshadow his future philosophy. Of these, perhaps the most remarkable is his *Theory of the Heavens*, published anonymously in 1755, and dedicated by its author, who set a high value on it, to Frederick the Great. It consists of a bold attempt to extend the Newtonian theory to the original formation of the planetary system, and is remarkable as containing, amongst other anticipations, a prediction of the discovery of additional planets, such as Uranus and Neptune, and of the resolution of the nebulae into systems of stars. The style of this treatise Kant never surpassed; and, with his other works of this early period, it proved him to belong to the great family of metaphysicians, represented by Aristotle, Descartes and Leibnitz, to whom the most widely remote fields of knowledge have been equally familiar. In 1763 appeared an equally elaborate work on the *Only Possible Method of Demonstrating the Existence of God*. This states the argument from design, which, of course, Kant does not hold to be demonstrative, much in the same light as his subsequent philosophy; but the demonstration itself, resting upon the necessity of a deity to account for the abstract possibility of things, is a remnant of the Wolfian metaphysics, against which he afterwards waged so remorseless a warfare. Far inferior to these trea-

¹ He had already published in 1747 his first work, *Thoughts on the True Measure of Living Forces*. This treatise, written at the age of twenty-two, contains a most acute and elaborate refutation of the doctrine of Leibnitz, and is worthy to rank with the best in that famous controversy.

Kant. tises in vigour and freshness, is his essay on the *Evidence of the Principles of Natural Theology and Morals*, which obtained in 1763 the *accessit* prize from the Berlin Academy, the first honour being gained by Moses Mendelssohn, who soon after became his correspondent, and, in several points, his friendly antagonist. To this period belongs Kant's acute tract on the *False Subtlety of the Syllogistic Figures*, the last three of which he shows to contain unexpressed propositions, and to be merely contorted forms of the first and only legitimate figure. These writings, with the growing number of his pupils, gradually spread his fame beyond his immediate circle, and gave him a place with Sulzer, Lambert, and Garve, among the lights of German philosophy. It was long, however, before he could obtain a congenial position in his own university. In 1764 the Professorship of Poetry was offered him and declined. His first post was that of under keeper of the royal library, at the modest salary of less than L.10 a-year, conferred on him in 1766, as a person "fully accomplished, and celebrated for his learned writings." In 1770, after declining offers from Erlangen and Jena, he was promoted, as the reward of his patience, to the ordinary chair of logic and metaphysics in Königsberg, the emoluments not amounting in all to more than L.60 per annum. On this occasion, he published his celebrated thesis *De Mundi Sensibilis et Intelligibilis Forma et Principiis*, which contains more than the germ of his succeeding philosophy, and proves that by this time he was in possession of the key to all his future discoveries. Hardly any mind so great ever ripened so slowly; and it was not till after eleven years more of patient thinking, often interrupted by delicate health, that his completed system was given to the world. His *Critique of Pure Reason*, by far his greatest work, was published in July 1781. It was dedicated to Baron von Zedlitz, minister of public instruction in Prussia, an accomplished and liberal-minded man, who had honoured Kant with many marks of his favour, and sought in vain to remove him to Halle in 1778 by the prospect of a double salary, and a larger academic sphere. The *Critique* contained a complete revision of metaphysical science, and was the most important work that had appeared in philosophy since the *Meditations* of Descartes, or Locke's *Essay on the Human Understanding*. It was the first great work of the kind in the German language. It terminated for ever the metaphysical dogmatism of Leibnitz and Wolf; while, at the same time, it sought to outflank the scepticism of Hume, and determine infallibly the contents and limits of philosophical knowledge. An outline of its doctrines will be found below, whence some conception of its extraordinary originality and herculean vigour of thought may be obtained. As was natural with such a work, it made its way at first slowly, and was exposed to some ignorant or captious reviews, one of which especially denounced it as a system of idealism; but its chief danger lay of sinking into oblivion, before its true significance could be ascertained. Hence Kant, in 1783, published a kind of running commentary on his first work, and reply to his critics, under the title of *Prolegomena to every Future System of Metaphysics claiming to be a Science*. This more popular and interesting treatise, which is still by far the best introduction to the Kantian philosophy, made a great impression, and by degrees the new system attracted universal attention, and provoked unexampled controversy. A second edition of the *Critique* was called for in 1787, and considerably modified, so as to obviate the charge of idealism, after which it remained unaltered.

Meanwhile Kant laboured with intense ardour, though now upwards of sixty years of age, to perfect the development of his philosophy in all its compass. His *Metaphysics of Ethics* appeared in 1785; his *Metaphysical Principles of Natural Science*, in 1786; his *Critique of Practical Reason*, in 1788; and his *Critique of Judgment*, which in

some measure crowned his system, and contained its applications to aesthetics and natural theology, in 1790. His ethical system, in its turn, attracted almost as much notice as his speculative; and the energy with which he set forth the moral law as a categorical imperative or absolute precept of reason to itself, and condemned all intermixture of sentiment with this sovereign motive, made the deepest impression. His speculative system seemed to have shut the door on all communion between the human mind and the infinite; but his doctrine of practical reason withdrew the obstacle, and in connecting man with absolute duty, restored him for all practical ends to absolute truth.

In spite of its frequent obscurity, its novel terminology, and its declared opposition to prevailing systems, the Kantian philosophy made rapid progress in Germany. In the course of ten or twelve years from the publication of the *Critique of Pure Reason*, it was expounded in all the leading universities, and it even penetrated into the schools of the Church of Rome. Such men as Schulze in Königsberg, Kiesewetter in Berlin, Jacob in Halle, Born and Heydenreich in Leipzig, Schmid in Jena, Buhle in Göttingen, Tennemann in Marburg, and Snell in Giessen, with many others, made it the basis of their philosophical teaching, while theologians like Tieftrunk, Stäudlin, and Ammon, eagerly applied it to Christian doctrine and morality. Young men flocked to Königsberg as to a shrine of philosophy. The Prussian government even undertook the expense of their support. Kant was hailed by some as a second Messiah. He was consulted as an oracle on all questions of casuistry,—as, for example, on the lawfulness of inoculation for the small-pox. Learned ladies joined in the act of pilgrimage; and the whole philosophic world was divided into Kantists and anti-Kantists. Much of this enthusiasm was only transient; and in the case of a Reinhold or a Fichte, the vehement idolater only portended the future iconoclast. This universal homage for a long time left Kant unaffected; it was only in his later years that he spoke of his system as the limit of philosophy, and resented all further progress. He still pursued his quiet round of lecturing and authorship, and contributed from time to time papers to the literary journals. Of these, among the most remarkable, was his review of Herder's *Philosophy of History*, which greatly exasperated that author, and led to a violent act of retaliation some years after in his *Metakritik of Pure Reason*. Schiller at this period in vain sought to engage Kant upon his *Horen*. He remained true to the *Berlin Journal*, in which most of his criticisms appeared.

In 1792, Kant, in the full height of his reputation, was involved in a painful collision with the government on the question of his religious doctrines. Another minister of spiritual affairs had replaced Von Zedlitz; and, in an age peculiarly lax and heterodox, an unwise attempt was made to apply a rigid censorship to works of philosophical theology. It was not wonderful that the philosophy of Kant had excited the declared opposition of all adherents of historical Christianity, since its plain tendency was towards a moral rationalism, and it could not by any process of interpretation be reconciled to the literal doctrines of the Lutheran church. It would have been much better to permit his exposition of the *Philosophy of Religion* to enjoy the same literary rights as his earlier works, since Kant could not be interdicted without first silencing a multitude of theologians who were at least equally separated from positive Christianity. The government, however, judged otherwise; and after the first part of his book, *On Religion within the Limits of Pure Reason*, had appeared in the *Berlin Journal*, the publication of the remainder, which treats in a more rationalizing style of the peculiarities of Christianity, was forbidden. Kant, thus shut out from Berlin, availed himself of his local privilege, and, with the sanction of the theological faculty of his own university,

Kant.

Kant.

published the full work in Königsberg. The government, who were probably as much influenced by hatred and fear of the French Revolution, of which Kant was supposed to be a partizan, as by love of orthodoxy, resented the act; and a secret cabinet order was received by him intimating the displeasure of the king, Frederick William II., and exacting from him a pledge not to lecture or write at all on religious subjects in future. With this mandate Kant, after a struggle, complied, and kept his engagement till 1797, when the death of the king, according to his construction of his promise, set him free. This incident, however, produced a very unfavourable effect on his spirits. He withdrew in 1794 from society; next year he gave up all his classes but one public lecture on logic or metaphysics; and in 1797, before the removal of the interdict on his theological teaching, he ceased altogether his public labours, after an academic course of 42 years. He had previously, in the same year, finished his two treatises on the *Law of Nature*, and on *Practical Morals*, which, with his *Anthropology*, completed in 1798, were the last considerable works which he revised with his own hand. His *Lectures on Logic*, and on *Physical Geography*, were edited during his lifetime by his friends and pupils. By way of asserting his right to resume theological disquisition, he also issued in 1798 his *Strife of the Faculties*, in which all the strongest parts of his work on religion were urged afresh, and the correspondence that had passed between himself and his censors was given to the world.

From the date of his retirement from the chair Kant declined in strength, and gave tokens of intellectual decay. His protest against Fichte, published in 1799, is perhaps to be traced to this cause; and he manifested other signs of uneasiness at the revolt of his former disciples from his authority. His memory began to fail, and a large work at which he wrought night and day, on the connection between physics and metaphysics, was found to be only a repetition of his already published doctrines. After 1802, finding himself attacked with a weakness in the limbs, attended with frequent fits of falling, he mitigated a little the Spartan severity of his life, and also consented to receive medical advice. A constant restlessness oppressed him; his sight gave way; his conversation became an extraordinary mixture of metaphors; and it was only at intervals that gleams of his former power broke out, especially when some old chord of association was struck in natural science or physical geography. A few days before his decease, with a great effort he thanked his medical attendant for his visits in the words, "I have not yet lost my feeling for humanity." On the 12th of February 1804, he breathed his last, having almost completed the eightieth year of his age.

It is superfluous to characterize the genius of Kant; but a few words may be added as to his personal appearance and habits of life, study, and teaching.

His stature was small, and his appearance feeble. He was little more than five feet high; his breast was almost concave, and, like Schleiermacher, he was deformed in the right shoulder. His hair was light, his complexion fresh, his forehead high and square, while his eye of light blue showed an expression of unusual depth and power. His senses were quick and delicate; and, though of weak constitution, he escaped, by strict regimen, all serious illness till the close of life.

His life was arranged with mechanical regularity; and, as he never married, he kept the habits of his studious youth to old age. His man-servant awoke him summer and winter at five o'clock; and, on being appealed to on one occasion, testified that Kant had not once failed in thirty years to respond to the call. He studied after rising for two hours, then lectured other two, and spent the rest of the forenoon, till one, at his desk. He then dined at a restaurant, which he frequently changed, to avoid the influx of

Kant.

strangers, who crowded to see and hear him,—till in later years his growing means enabled him to invite a friend or two daily to his own home. This was his only regular meal; and as he loved the *ducere cenam* of the Romans, he often prolonged the conversation till late in the afternoon. He then walked out for at least an hour in all weathers, and spent the evening in lighter reading, except an hour or two devoted to the preparation of his next day's lectures, after which he retired between nine and ten to rest. The furniture of his house was of the simplest character; and though he left a considerable sum, the produce of his writings, to his relatives, he indulged in no luxury, and was a pattern of that superiority to fashion and appearance so often met with in the literary life of Germany. In his earlier years he often spent his evenings in general society, where his overflowing knowledge and conversational talents made him the life of every party. He was especially intimate with the families of two English merchants of the name of Green and Motherby, where he found many opportunities of meeting ship-captains, and other travelled persons, and thus gratifying his passion for physical geography. This social circle included also the celebrated Hamann,—the Magus of the North,—the friend of Herder and Jacobi, who was thus a mediator between Kant and these philosophical adversaries.

Kant's reading was of the most extensive and miscellaneous kind. He cared comparatively little for the history of speculation, being in this department more a discoverer than a scholar. But his acquaintance with books of science, general history, travels, and *belles lettres*, was boundless. He was well versed in English literature, chiefly of the age of Queen Anne; and had read English philosophy from Locke to Hume, and the Scottish school. He was at home in Voltaire and Rousseau, but shows little acquaintance with the French sensational philosophy. He was familiar with all German literature up to the date of his *Critique*; but ceased to follow it in its great development by Goethe and Schiller. It was his habit to obtain books in sheets from his publishers Kanter and Nicolovius; and he read over for many years all the new works in their catalogue, in order to keep abreast of universal knowledge. He was excessively fond of newspapers and works on politics; and this was the only kind of reading that could interrupt his studies in philosophy.

As a lecturer, Kant avoided altogether that rigid style in which his books were written, and which was only meant for thinkers by profession. He sat behind a low desk, with a few jottings on slips of paper, or text-books marked on the margin, before him, and delivered an extemporaneous address, opening up the subject by partial glimpses, and with many digressions and interspersed anecdotes or familiar illustrations, till a complete idea of it was presented. His voice was extremely weak, but sometimes rose into eloquence, and always commanded perfect silence. Like Adam Smith, he fixed his eye on one student, and marked by his countenance whether the lecture was understood. The least irregularity in the appearance or dress of this selected hearer disconcerted him; and the story is well known of the missing button, which defeated a lecture. Though kind to his students, he refused on principle to remit their fees, as this, he thought, would discourage independence. It was another principle, that his chief exertions should be bestowed on the intermediate class of talent, as the geniuses would help themselves, and the dunces were beyond remedy. Hence he never delivered his deeper doctrines, such as are found in his *Critique*, from the chair. His other avocations allowed him little personal intercourse with his numerous hearers, and he often complained of the want of lively sympathy and ascertained progress inseparable from such a system.

Simple, honourable, truthful, kind-hearted, and high-

Kant.

mindful as Kant was in all moral respects, he was somewhat deficient in the region of sentiment. He had little enthusiasm for the beauties of nature, and, indeed, never sailed out into the Baltic, or travelled more than 40 miles from Königsberg. Music he disregarded, and all poetry that was more than sententious prose. His ethics have been reproached with some justice as setting up too low an ideal for the female sex. The devotional element, as distinct from the moral, was but faint in his nature; and he almost never attended any religious service. Though faithful in a high degree to the duties of friendship, he could not bear to visit his friends in sickness, and after their death he repressed all allusion to their memory. His engrossing intellectual labours no doubt tended somewhat to harden his character; and in his zeal for rectitude of purpose he forgot the part which affection and sentiment must ever play in the human constitution. Those who count these defects most grave will yet find much to admire in the lofty tone of his character, and in the benevolence which could thus express itself: "Whoever will suggest to me a good action left undone, him will I thank, though he suggest it even in my last hour!"

This notice may appropriately close with Herder's beautiful sketch of Kant's character, all the more interesting that it was written in 1795, after their quarrel,—"I have had the good fortune to know a philosopher who was my teacher. In the vigour of life he had the same youthful gaiety of heart that now follows him I believe into old age. His open forehead, built for thought, was the seat of imperturbable cheerfulness and joy; the most pregnant discourse flowed from his lips; wit, humour, and raillery came to him at will, and his instructions had all the charm of an entertainment. With the same easy mastery with which he tested the doctrines of Leibnitz, Wolf, Baumgarten, Crusius and Hume, or pursued the discoveries of Newton, Kepler, and other lights of science, he also took up the current writings of Rousseau, such as the *Emile* or *Heloise*, or any new phenomenon of the natural world, and from the criticism of each came back to the impartial study of nature, and to the enforcement of the dignity of man. History in all its branches, natural science, physics, mathematics, and experience, were the materials that gave interest to his lectures and his conversation; nothing worthy of study was to him indifferent; no faction or sect, no selfishness or vanity, had for him the least attraction, compared with the extension and elucidation of truth. He excited and pleasantly impelled us to mental independence; despotism was foreign to his nature. This man, whom I name with the deepest gratitude and respect, is Immanuel Kant; his image rises before me surrounded with pleasing recollections!"

Subjoined is a brief sketch of the Kantian philosophy, drawn from original sources. The list of the works of Kant, which have been more or less consulted, will be found complete in the twelfth and last volume of Rosenkrantz and Schubert's edition, Leipzig, 1838-42.

The Kantian philosophy is essentially an *Inquiry into the Possibility of a System of Metaphysics*. This gives unity to the whole of Kant's writings on philosophy. His views on psychology and logic are chiefly interesting from their bearing on this great question, while his ethics virtually contain the solution, and are thus a vital part of his metaphysics. His philosophy is nearly all included in his *Critique of Pure Reason*; and this work, accordingly, must be taken as the basis of a development of his system. A few words as to Kant's conception of the problem which he had to solve, and his own view of his relation to other philosophers, will fitly introduce the account of his own metaphysical investigations.

Metaphysics, according to Kant, in which he only echoes the general voice of philosophers, is conversant with the world above sense, or beyond experience. It is occupied

with such problems as the nature of absolute being (*ontology*), the essence and immortality of the soul (*pneumatology*), the prevalence of freedom or fate in the world (*cosmology*), the being of God (*speculative theology*). Such problems as these have eternally recurred to human reason, and cannot be escaped, as there are inevitable tendencies in the mind itself to give them birth. We have faculties that go beyond sense, and elements of thought, which, as being universal and necessary, cannot be derived from experience; and these in their workings infallibly create the inquiries with which metaphysics has to deal.

According to Kant, metaphysical inquiries up till his time had passed through two stages. A succession of systems had confidently decided all the questions that arose, and each of these systems, on its own principles, had announced itself as the consummation of metaphysical truth. This was the *dogmatic* stage. Then the collision of these systems and their inherent contradiction had begotten a distrust of the whole alleged results, and issued in the assertion that sense and experience were the only sources of our knowledge, and that the metaphysical region was an entire illusion. This was the *sceptical* stage which followed in the wake of the other. Kant saw the type of the dogmatist in Leibnitz or Wolff, of the sceptic in David Hume. In contradistinction to both, he maintained the necessity of instituting a critical inquiry into the powers of human reason, so as, on the one hand, to test the sceptic's denial of all beyond experience *in the mind*; and, on the other, to test the dogmatist's application of what was above experience in the mind *to the nature of things*, or the world of metaphysics. The result was, that against the sceptic a whole system of knowledge, underived from experience, was proved to exist in the mind; and that against the dogmatist this knowledge was declared to give no hold, at least so far as speculation is concerned, over the nature of things or metaphysical truth. The Kantian philosophy thus substitutes for positive metaphysics a criticism of pure reason, explaining why there can be none; and at the same time vindicates those elements of knowledge that beget metaphysical inquiry from sceptical rejection and contempt. Hence, in opposition to dogmatism, Kant chose to call his the *critical* philosophy; in opposition to an empirical scepticism which denied the existence of all knowledge *à priori*, or as transcending experience, he called it the criticism of *pure* reason, or *transcendental* philosophy.

Kant admits that, having been once himself a dogmatist of the school of Wolff, he was awaked out of his slumber by Hume's resolution of the causal law into a product of association or experience. He saw that, if there was to be a valid science of metaphysics at all, it must be founded upon a power of the mind to frame such judgments as that of cause and effect antecedently to all experience, and to guarantee their application to the whole realm of being. He was led to generalize the whole class of such judgments, as distinguished by this common character, that they unite two totally unconnected ideas in a single proposition, which, being necessary and universal, is not derived from experience. This is his celebrated designation of *synthetic judgments à priori*, which alone can form the basis of metaphysics; whereas logic deals exclusively in *analytic judgments*, in which the one idea is deduced from the other as assumed, and can never reach the world of reality. These synthetic judgments, touching cause and effect, substance and phenomenon, and other metaphysical ideas, to say nothing of mathematical truths, which, with a bold originality, Kant annexes to the same class, prove an element to exist in knowledge unrecognised by the sensationalism of Locke and Hume. But it remains to be seen how far such judgments reach in binding down absolute truth to the human standard, or in conquering a world of metaphysical reality. The whole *Critique of Pure Reason* is written to prove that

Kant.

Kant. they come short of this aim ; and this humbling thesis is elaborately maintained in all the three departments which supply the materials of *pure*, or *à priori* knowledge, or, in other words, furnish the elements of synthetic judgment, viz.,—sense, understanding, and reason. In each of these departments, then, we must show how Kant, on the one hand, lays open elements of knowledge pre-existent to experience ; and yet, on the other, asserts these elements to fail in reaching the nature of things, or in grasping absolute metaphysical truth.

In the world of sense, the transcendental or pre-existent elements of knowledge are space and time. These are pure sensuous intuitions, without which empirical sensations would be impossible. They are hence called by Kant the *forms* or formal conditions of sensation ; the one applying to all sensational experience in the outward world, the other as well to all sensational experience of mental phenomena. As mathematics is occupied with these primary forms of sense, it is easy to see how all its synthetic judgments are originated, because they rest on sensuous intuition or contemplation, comparing mathematical quantities with each other ; and also how they hold good in the actual world of sense, since that world only exists in conformity to these *à priori* conditions. Thus far, Kant, as a transcendentalist, vindicates an *à priori* space and time against the sensationalist who deduces them from experience, as also against the intellectualist, like Leibnitz, who treats them as mere relations of co-existent and successive objects. But no sooner is an attempt made by the dogmatic metaphysician to give to space and time an absolute and eternal reality, or to claim for things as existing in space and time anything but a phenomenal aspect as relative to our senses, than he turns the other or critical edge of his sword to assail this result. His principal argument is, that real and independent existences being facts, can never be known *à priori*, but only through experience ; and hence that, if time and space were independently existing realities, the necessary character of our judgments regarding them would be entirely destroyed. This argumentation will of course be valid with those who allow necessity to nothing but judgments regarding ideas. With those who hold that necessity may belong as well to judgments regarding facts, and that the existence of space and time severally is given as a necessary fact, it will be powerless.

In the department of understanding, which is the second great field of Kant's critical inquiry, substantially the same result is attained. Sense delivers up its presentations in space and time to this higher faculty, whose office it is to introduce into them unity and system, so that they shall deserve the name of knowledge or experience. This is done by the faculty of judgment, the characteristic process of the logical understanding, which combines the multiform data of sense in the unity of propositions. Ordinary logic lays down the *forms* of propositions, irrespective of their matter ; and is entirely *analytical*. But the required connection would not be introduced among the data of sense without certain transcendental or pre-existent elements, which belong to the *matter* of propositions, and consequently furnish *synthetic judgments à priori*, to be investigated by a higher or transcendental logic. These necessary elements, or *à priori* principles of judgment, Kant, by an unhappy adaptation of Aristotle's language, called "categories of the understanding ;" and he developed them in a parallel line with the logical form of propositions, since it seemed to him, though the analogy is more than doubtful, that the *transcendental matter* of judgment must correspond with its *logical form*. This celebrated table of the categories is subjoined :—

	Logical.	Transcendental.
I. Quantity.....	Universal.	Unity.
	Particular.	Plurality.
	Singular.	Totality.

	Logical.	Transcendental.
II. Quality.....	Affirmative.	Reality.
	Negative.	Negation.
	Indeterminate.	Limitation.
III. Relation	Categorical.	Substance.
	Hypothetical.	Cause.
	Disjunctive.	Reciprocity.
IV. Modality	Problematical.	Possibility.
	Assertory.	Existence.
	Apodictic.	Necessity.

As a still higher principle of *à priori* judgment than even the categories, Kant insisted on the consciousness of personality, by which alone unity is introduced among the data of outward and inward perception, and the multiplicity of existence made to converge towards one necessary centre. In regard to this principle, and the twelve categories, he laboured to show that without them no connection of the materials of sense is possible ; that they are thus the intellectual conditions of sensational experience, and that, abstracted from them, even the conception of a single object in nature, much more of a system of things called nature, is unattainable. So far from nature giving laws to mind, mind gives laws to nature ; and it is thus alone that synthetic judgments *à priori* are possible and authoritative, since the only world man can know must exist under these conditions. Such synthetic judgments Kant deduces as corollaries from the application of the categories, with the help of imagination, to *time*, as the main *à priori* datum of sensation. Amongst these synthetic judgments, on the deduction of which a vast amount of ingenuity is expended, is that of cause and effect ; and thus the philosophy of Hume is inverted ; for, while Hume derives the causal judgment from experience, Kant proves that without this judgment, and others akin to it, the very idea of an objective world, and of experience in that world, such as is universally held by all systems of philosophy, idealist as well as realist, would remain impossible. Kant even goes so far in vindication of our original knowledge, against the sensationalist, that he attempts to show that the reality of an outward world, which the sensationalist believes in from experience, can alone be made good by borrowing from the transcendentalist the *à priori* notions of time and of substance ; since the mind, according to Kant, needs some substance distinct from itself to mark the succession of its own ideas, which substance is the external world. But here again, having, as a transcendentalist, dissected and laid open the texture and original furniture of the understanding, he proceeds, as a critical or anti-dogmatical philosopher, to shut up the understanding from all excursions into the region of metaphysical reality, and to limit it to the territory of phenomena or sense. His celebrated distinction between *phenomena*, or objects known by sensible experience, and *noumena*, or objects knowable by the pure understanding, is here brought to bear ; and he allows to the latter only a problematical existence, as the bare negation of what we can know by our understanding, or as something of whose existence and whose mode of being known, if known at all, by other understandings, we must ever remain ignorant. This distinction is thus carried out by him in regard to the actual objects of our understanding. Man must know objects as quantities, qualities, substances, causes, &c., because without these conceptions, as the constitutive and regulative principles of his understanding, that understanding would leave its objects an undigested chaos, as good as none at all ; but whether there be an unknown basis to this phenomenal world or not, or if there be, what its own nature is, must continue, so far as the understanding is concerned, an entire and insoluble mystery. On this point, indeed, Kant's language is fluctuating, and even contradictory ; for in some places he proceeds on the existence of this unknown *x*, and even treats phenomenal existence as its product and manifestation, while he elsewhere, in the strongest terms, maintains that it is only a

Kant.

negative conception, and that we can predicate, because we can know, absolutely nothing of it whatever. But his doctrine is so far clear and unambiguous, that our understanding has no power to lay hold on a super-sensible world; that the categories and synthetic judgments of the understanding are mere abstractions, till realized in phenomenal experience; and that unless the *à priori* elements of intellect be brought down, through the ministry of imagination, to unite with presentations of external or internal sense, they have as little significance as the latter would have without their co-operation.

On this fundamental point of the Kantian philosophy much may be conceded by those who yet reject his conclusions. Waiving Kant's error (for such it seems) in making the understanding, which can never be more than a mere logical faculty, the fountain of the categories and so-called intellectual conditions of sensible experience, it may be admitted that such conditions must be furnished by some mental power or other, and that Kant's analysis has in it much truth, if not the whole. It may also be admitted that mind thus unites with nature in forming a joint product of knowledge, to which both elements or factors are necessary. But it may fairly be denied that the world of experience is thus the creature of mind, and that its objects only become such by virtue of subjective laws and necessities, since this would represent the understanding as practising upon itself a constant delusion, and mistaking its own products for objective realities. The validity of our synthetic judgments *à priori* does not, in spite of Kant's oft-repeated asseveration, depend on the fact that these judgments cast our experience in their own mould, without which it would be no experience at all; but it rests upon a mysterious primary belief, by virtue of which these judgments are held valid the moment they are formed, and are extended to all objects in connection with which they can arise. There is not the least reason why, because certain judgments make sensible experience possible, they should either be affirmed to make that experience relative to us, or should be themselves limited to the domain of sensible experience, if capable of being extended beyond it. The causal judgment, for example, is necessary to connect our world of phenomena, outward and inward; but why it should, on this ground, be limited to *our* phenomenal world, or to any enlarged phenomenal world of which *we* may be supposed capable of having experience, is quite inconceivable. It is only limited by its own nature, for, as Kant has justly shown, it pre-supposes time, and change in time, and of course does not emerge without these conditions. So of every other synthetic judgment of the understanding in Kant's series. It is thus plain that Kant's attempt to limit the use of the categories and principles of the understanding is founded on a mistake. It is their own nature which limits them, and not their relativity to *our* sensible experience. A *noumenal* world—or world in which these laws, their proper conditions being given, should be set aside—we have absolutely no power to believe in as existing for any intelligence. That there may be a world beyond the conditions of time and change, which are the highest principles of Kant's synthetic judgments of the understanding, is not in the least degree opposed to the universal necessity of these judgments, for they ask no validity beyond their own condition or sphere. This is the only sense in which Kant's *noumenal* world can be admitted; and the investigation of this problem belongs to the next section of his inquiry. But it must be contended that he has no right, so far as he has yet proceeded, to introduce a contrast between things in themselves and things as conditioned by the laws of our understanding, and that his *noumenal* world, lying at the bottom of our actual world, and exempted from the laws of our necessary synthetic judgments, is a mere superfluity and self-made shadow. If it be a pure license

of thought, let it remain so; but let not Kant claim for it, as a veritable world, exclusive metaphysical reality, to the disparagement of the only world we know, in which the laws of the understanding find their application.

It is in the third and last grand division of Kant's critical philosophy that all the highest questions of metaphysics find the possibility of an answer denied. This division is occupied with the Reason or Faculty of Ideas. The idea is a Platonic word, as the category an Aristotelian, and denotes, in Kant's writings, an object which cannot be reached in any possible experience. Reason creates no new materials of its own,—it only enlarges the data of the understanding, by taking in all the conditions on which they depend. Hence, an idea is the sum total of conditions, itself unconditioned, by which a still higher unity is given to the materials of experience than understanding could supply. *Reason resembles reasoning, as understanding resembles judgment*; and since reasoning employs a universal proposition as the condition of a particular conclusion, Reason must, in finding out the sum total of conditions, follow an analogous procedure to the processes of reasoning; whence, as there were twelve categories corresponding to the twelve forms of propositions, there are three transcendental ideas corresponding to the three processes of reasoning—categorical, hypothetical, and disjunctive. These ideas, which are deduced even in a more strained and arbitrary fashion than the categories, are,—(1.) Pure thinking, substance, or soul, the correlate of an absolute subject in a categorical syllogism, and the basis of the science of *rational psychology*; (2.) The totality of dependent phenomena in space and time, or the world, the correlate of the consequent in a hypothetical syllogism, and the basis of *cosmology*; and, (3.) The Highest Ideal, which is the condition of the possibility of every object of thought, or God, the correlate of an exhaustive disjunctive syllogism, and the basis of *theology*.

These three ideas Kant, as a transcendentalist, strenuously maintains to have their birth in human reason, irrespective of all experience, and to spring up inevitably, so as to control and influence the working of the understanding as applied to experience. But they differ, he contends, from the categories in this, that they cannot be brought down by the ministry of imagination and united to experience in any presentation within the limits of space or time, so that they have no objective validity, and are designed to serve no other use than to regulate our own thoughts. Nevertheless they perpetually tend, by a necessary sophistication, to acquire objective subsistence; so that, from being mere postulates, or maxims of reason employed to give our subjective views of experience the greatest enlargement and unity, they become assertions as to absolute existence, and posit their objects—a pure, incorporeal spirit; a world, finite or infinite, dependent or independent; and a supreme Being—amongst the entities of metaphysical reality. This so-called dialectical illusion it is the aim of the most interesting and energetic part of Kant's *Critique of Pure Reason* to expose; and here the critical thrusts of his philosophy seem to bear most hard upon the treasured and precious convictions of the human race. A brief notice of his elaborate argumentation is all that can be given, with still briefer hints of its failures and deficiencies.

He first unmasks what he calls the *paralogism of pure reason* in regard to the thinking subject, or soul. It may be remarked that this is one of the most forced of all Kant's ideas, since it is only his transcendental self-consciousness, already discussed as the highest principle of the understanding, brought up under a new form, and without any reference to the sum total of the conditions of experience at all, in which an idea according to him ought to consist, given forth as a pure idea of thinking substance—simple, personal, incorruptible, &c. The dogmatic conclusions of rational psychology, as founded on this idea, Kant opposes

Kant.

Kant.

by showing that they confound the *consciousness of the mind in thinking* with its *nature as an object in existence*. He grants the consciousness of simplicity, personality, &c., but denies the validity of the inference which would guarantee the indivisibility of the soul and its unaltered substance, as well as unbroken duration; since all this lies beyond the compass of experience in space and time. Few will contend against Kant that the bare *a priori* necessity of unity in our consciousness, apart from experience, would warrant any solid inference as to the substance or fortunes of the soul, as few will care to defend a so-called *rational* psychology from his attacks. But it seems too much to ask that mental simplicity, unity, and identity, as admitted *facts of experience*, should go for nothing, and that any and every inference against the materialist should be forbidden, so as to leave room for a supposition like Kant's, that, for aught we can tell, the unknown base of mind and matter, in spite of their divergent phenomena, may be the same.

Kant next discusses his second Idea of Pure Reason, or the World, that is, the sum total of the conditions of phenomena presented in sensible experience. The world is thought under the categories of the understanding; and each of the four leading categories, when extended beyond experience, gives birth to a transcendental idea, or rather a pair of such ideas contrasted and opposite; for, in *quantity*, the world is either bounded by a limit in time and space, or unbounded; in *quality*, it is either ultimately simple, or infinitely divisible; in *relation*, it is either caused by free activity, or made up of an infinite series of mechanical causes; and in *modality*, it has either an independent cause, or is composed of mutually dependent members. Such are Kant's famous antinomies, which brought the controversies of ages to a focus, and have exerted an immense influence on all later European philosophy, giving birth to a whole body of celebrated discussions respecting the conditioned and unconditioned, and necessitating the German philosophy of the Absolute to build upon contradiction, or at least upon antithesis, as the essence and criterion of truth. Kant endeavours to show that each of the two sides of the antinomy is speculatively as well supported as the other, and that the human mind must remain eternally *in equilibrio*, if the forms of thought are held to apply to the realities of existence.

It is of course impossible to condense Kant's reasoning on this subject. It may be remarked, however, that his four antinomies seem reducible, when liberated from the network of the categories, to two, arising from the notions of whole and part on the one hand, and of cause and effect on the other. Kant's two first, or mathematical antinomies, fall under the first head; his two last, or dynamical, under the second. It is readily conceded to Kant that we cannot reach in experience or in thought a time eternal or a space infinite, or stop with a finite of either kind. And it is as freely admitted that we cannot reach an infinite series of parts of any given portion of space and time, or stop with a finite. Applied to these mysterious quantities—space and time—Kant's antinomies seem invincible; but it may be questioned if his argumentation has any force at all in regard to a *world* in space and time, considered either in its totality or in its parts. If I am allowed to think space and time as not merely forms of imagination, but as independent entities, I can easily make them boundaries of matter, and thus reach a universe that had a beginning and that has a limit, so as to escape Kant's first antinomy; and by the same means I can reach a part which may be believed to be ultimate, though it is greater than a conceivable subdivision of the space which contains it, and thus escape his second. The difficulties, too, are of different magnitude on the side of the infinite and of the absolute. We cannot exhaust the former by imagination, but we can readily stop in imagination with the latter at the bidding of any higher reason which should give law to that faculty. In

VOL. XIII.

Kant.

other words, the infinite labours under an insuperable difficulty of imagination; the absolute labours under a superable difficulty of belief.

The remaining antinomy of freedom or necessity in the universe, including Kant's additional one of independence or contingency, which may be easily reduced to it, does not seem capable of stronger resistance. There must be free causation somewhere, Kant argues on the one side, else there is no causation at all; and there cannot be free causation, he argues on the other, since the free cause is itself an effect. This latter assertion is, however, based on a false idea of causality. The energy of causation is destroyed by the supposition of an infinite series of dependent causes, each receiving and transmitting a mechanical impulse. Unless there be somewhere a single First Cause there is no true causation; for the multiplication of relatively caused phenomena cannot solve the problem or explain so much as one of the series. Kant's feeble conception of causality, as little more than regulated sequence in time, permitted him to leave both sides of the antinomy equal; but a juster definition would reduce all mechanical causation to the mere effect of free causation, and would thus abolish Kant's last antinomies, so as to place, even on the basis of pure reason, carrying out the causal law to its limits, a single hyper-physical cause at the head of a dependent universe. The causal judgment, in its true construction, runs up all dependent phenomena in time to an absolute beginning, and thus bursts through Kant's two last antinomies; while it also supplies the element of will or freedom, which, by setting limits to matter in space and time, decides against the validity of his two first, as alleged insoluble contradictions of reason.

Kant's own solution of his antinomies is very different. He maintains that they only arise from our inveterate habit of confounding our own laws of thought with independent existence. If existence had to be subjected to each dilemma, nothing would remain but pure scepticism. It is only our own confusion of a totality in our conceptions with a totality in things, as existing in themselves, which misleads us; whereas if we would only confess that the idea of the world in its totality is too great for us, and would confine it as a regulative principle to our thoughts in order to give them their greatest enlargement, leaving existence altogether undefined, we should be empowered to discard both sides of each dilemma, and to hold existence as unaffected by neither. Unfortunately this seems forbidden by the law of excluded middle between contradictories, which applies to existence as well as to thought; and thus Kant's denial of the metaphysical range of his antinomies, and his attempt to speak pleasantly of them as a torment and doom of finite reason for mistaking its shadows for realities, its fragments for the whole of things, is a consolation which can only be accepted by despair. Our knowledge of existence becomes thus not only faint but null; and speculative reason goes out in darkness.

A few words remain to be added respecting Kant's third Idea of Pure Reason; the Being which is the condition of the possibility of all being, or God. This Being, according to the exhaustive process of a disjunctive syllogism, in resemblance to which the idea is framed, possesses all reality; hence, though a mere idea of reason, it is objectified, hypostatized, personified; and afterwards this dialectical illusion is supported by three arguments,—the only three that can be employed to prove the existence of such a Being on the ground of speculative reason. These three arguments for the existence of God, which, after Kant, have been generally called the *ontological*, *cosmological*, and *physico-theological*, are subjected to rigid analysis, and successively declared insufficient. The *ontological* argument, or that which, in the hands of Anselm or Descartes, from the bare notion of an all-real or perfect Being, deduces his existence as a part of this reality or perfection, is shown to

G

Kant.

involve the fallacy of inferring objective existence from a mere logical conception, or, in Kant's language, of substituting an analytic judgment for a synthetic, which latter alone is wanted. The *cosmological* argument, or that which, in the hands of Dr Clarke, from the existence of something contingent, rises to a necessary Being, is declared to come short of any definition of this Being's character; since it cannot invest him with all perfection without taking for granted that very connection between ideal perfection and necessary existence, in assuming which the fallacy of the ontological argument consisted. And the *physico-theological* argument, or that from design and order in the universe, though Kant speaks of it with the highest respect, and declares it sufficient to awaken the speculatist from his subtle objections and difficulties, as from a dream, is nevertheless affirmed to stop short of the ideal of Deity, inasmuch as the finite cannot warrant an inference to the infinite; and thus the argument *a posteriori* is left to depend for its completion on the *a priori* resources already proved in themselves incompetent.

It seems possible to escape these negative conclusions of Kant only by enforcing the law of causality, so as to rise from the actual universe to an absolute First Cause, not merely of the order of this universe, but of its existence; with which First Cause the attributes of perfection or infinitude are then united, not by any ontological argument, but by a native belief. The limitation inseparable from a logical process in proving a Deity is thus avoided; and yet existence, in conformity with the universal judgment of reason, is traced back to an uncaused and independent original. Few have ever cordially accepted the marvellous results of Kant's criticism of speculative theology, according to which, Reason gives birth, along with other regulative ideas, to an idea of God, and compels us to think and arrange the universe in our minds,—*as if it had been made by a Being conformable to this idea*,—while it is yet utterly impossible for us to find a rational ground for believing in His existence.

Thus the soul, the world, and God, are left by Kant's speculative philosophy as problems not only unsolved, but, according to him, demonstrably insolvable; and, if no other oracle existed within, the riddle of man's being and relation to existence would remain unread. Such an oracle, however, is found in Practical Reason; and, to use a figure of Rosenkrantz, the life-boat of Kant's ethics rescues from the shipwreck of his metaphysics the truths necessary to human dignity and happiness.

Kant's speculative *Ethics*, as they are set forth in his *Outlines*, and his *Critique of Practical Reason*, are chiefly occupied with his analysis of the moral law as the ultimate fact of our practical nature, in which it holds a place, corresponding to the ideas of speculative reason. Unlike these ideas, however, the moral law is an assertion,—an assertion of something to be done, and done with absolute necessity for its own sake,—hence it is a *categorical imperative*. Here, for the first time in human reason, we meet an idea realized, or to be realized in experience; and thus our foot is planted upon the unconditioned, absolute, noumenal, or intelligible world. The moral law, as a categorical imperative, cannot determine the will by any motives beyond its own authority; hence, by nothing in the matter of its precepts, but only in the form; and as the only formal element in the will, in relation to motives, is voluntary determination, it follows that the moral law, as a universal and necessary imperative, involves *autonomy* or freedom, without which it cannot possibly exist. The moral law, as a law abstracted from all matter, and only retaining the form of legislation, or its relation to a free and self-determining will, necessarily expresses itself in these formulas, which are all equal, and which all flow from this principle:—"Act as a self-ruled agent, and not

Kant.

as a determined." "Act at all times so that your action may become a universal law." "Act so that each moral agent shall be treated as an end to himself." The moral law, as an *a priori* revelation, thus excludes all motives that do not directly spring from itself, and regard itself as law; so that all systems of morality, which admit other motives such as personal happiness, general benevolence, the love of perfection, or the will of God, fall under the charge of *heteronomy*. The law, as an imperative, governs by its own force; the only permissible moral sentiment is moral awe; and just in the degree in which this excludes other sentiments, as well as overcomes the working of passion and self-love, is an action morally pure. The imperative aspect of the moral law is the same to all intelligences, except the Highest; and, according to Kant, we dare not affirm that any can in any stage of their being be trusted without its influence.

While the moral law thus acts independently of all considerations of utility or happiness, it links us at the same time with a moral world, in which we cannot but believe that virtue and happiness are connected, and in which the moral law itself, by embracing the happiness of others in its precepts, makes it our absolute duty to strive after their connection. This moral world, in which virtue and happiness go hand in hand, corresponds to the ancient ideal of the *highest good*; and the belief in its existence is a necessary postulate of the moral law, which cannot be carried out if this faith in a moral world be subverted. Hence Kant employs this postulate of the highest good to gain a firm hold of immortality, which could not be secured by speculative reason, and shows that, without immortality, an infinite progress towards perfect virtue is impossible. In like manner he establishes the otherwise problematical existence of God, on the ground that God must exist as the source of the blessedness to the good; and, from his attributes as the author and ruler of this moral world, in which happiness is made to follow duty, he deduces all those perfections which speculative reason left doubtful. And while the *first* and *third* ideas of speculative reason are thus alleged to find solid footing, the *second*, or that of free causation, is also established on the basis of that liberty which is the condition of the moral law, or rather its inseparable correlative. Though actions must still be looked on as necessitated by motives, so long as man is considered to belong to the sensible world, yet in the higher or intelligible world to which, as the subject of the moral law, he belongs, they are absolutely self-caused; and thus the worst dilemma of speculation is practically decided in the interest of freedom.

It cannot be denied that there is a singular vigour and individuality in these ethical labours of Kant; and, in point of fact, his influence as the preacher of an unconditioned moral law not only awakened the schools, but even vitalized the pulpits of Germany. Nor can a certain accordance with the deepest convictions of the greatest thinkers of all ages be overlooked in his turning round for the solution of the gravest speculative difficulties to the oracle of practical duty. At the same time very serious objections lie against his ethical, not less than his speculative system. The radical difference between speculative judgments containing mere knowledge, and moral judgments bearing on right and wrong, is obscured by the common designation, *Reason*. The influence of moral sentiment, especially love of goodness, is all but proscribed and withered under the stern law of duty. The very law of duty, by the necessity of abstracting from all motives and all matter,—in short, everything but the bare form of law, becomes vague and indefinite; so that Kant's categorical imperative, in all its formulas, is rather a problem of the understanding than a law written out on the heart; and Kant himself, in the subsequent development alike of his system of jurisprudence and of virtue, has shown himself unable, except in the most constrained manner, and by the help of the very principles

Kant. and sentiments he had condemned as selfish and utilitarian, to bring down his generalities to practice. It must be confessed, also, that his settlement of the outstanding speculative problems, by the help of ethics, is not remarkably happy. Immortality is only deduced from the incurable defects of moral agents, which require an everlasting purgatory to remove them. Freedom is not directly based on the fact of felt responsibility, but rather on the utterance of a particular kind of law, viz., a categorical imperative, which contains at best an inferential assurance of power to obey. And God, instead of having his authority absolutely and unconditionally revealed as that of the Lawgiver, is rather discovered by the circuitous and secondary necessity of squaring the moral law and its consequences.

The third of Kant's leading critiques,—that of *Judgment*,—contains his *Æsthetics* and *Doctrine of Final Causes*. It consists of an elaborate attempt to find in judgment a middle term between understanding and reason, corresponding to the middle term between our intelligence on the one side, and our will on the other, furnished by pleasure and pain,—and thus to bridge over the interval between metaphysics and ethics. Kant finds the object of this judging faculty in the harmony of nature, of which, whether æsthetical or teleological, pleasure is the reflex and indication. This whole treatise, however highly lauded in Germany, probably from its tendency to favour, more than Kant's other works, a speculative construction of the infinite and absolute, seems forced in its plan and unsatisfactory in its development, and can only be regarded as interesting and valuable when taken out of the frame of the arbitrary method in which it is set. The discussions on teleology amplify, and in some respects modify, the argument from final causes already noticed (the physico-theological), in a spirit of remarkable conciliation with the ordinary strain of natural theology. The doctrines of æsthetics are propounded for the first time, and may be thus simply stated. The *beautiful* is no real existence in nature, nor is it capable of definition by a single formula; but it is a harmony (arising from an unknown cause which we place in nature) between the free play of the imagination and the laws of the understanding, in the enjoyment of which harmony the pleasure of taste consists. The *sublime* is the struggle of the imagination to grasp the vast in quantity or power, awakening pain from the sense of limitation, but counterbalancing that pain by the higher pleasure of reason, as it tends at the same moment towards the infinite, so that the discord is merged in purer harmony. The chief fault of both parts of this theory is vagueness. What this harmony of the faculties is, is not explained; and, in spite of many ingenious efforts, Kant's promised critical deduction of the validity of general principles of taste, as opposed to individual caprice, ends in little more than an appeal to the uniformity of our common nature.

This exposition of Kant's philosophy may close with an outline of his philosophy of religion, as contained in his work *Religion within the Limits of mere Reason*. This interesting and important treatise, which sets forth at length Kant's point of view as regards Christianity, has much to instruct, but also to pain, an adherent of positive and historical Christianity; though a candid appreciation of Kant's relation to his theological contemporaries will do something to mitigate its offence.

Kant starts in this treatise with such strong views of human depravity, that he has scandalized the naturalist school, who ascribe evil to negation, or to the influence of sense. Free will has, by a mysterious and original surrender, as indicated by Scripture allegories, placed impure motives above the law of duty. The forfeiture, though inexplicable, is real and sad; and the consequent depravity is universal and radical, though, from the very nature of freedom, not irrecoverable by a mighty act of will. This, however, requires a moral crisis or revolution; and the struggle with evil must remain

severe, and, in respect of absolute deliverance from it, interminable. There is, however, a new birth, in which the law of duty recovers its ascendancy; and the pain of repentance in the new man satisfies the justice of God for the sins of the old. This is allegorized in Scripture by the death of Christ as a comprehensive ideal of all the pangs of repentance; so that the new man puts on Christ, that is, the character of a person acceptable to God; is justified by the grace of God, which allows the hidden change to avail before it is proved by experience; and enjoys in the personal consciousness of this change the witness of the Holy Ghost. This is a sample of Kant's moral allegory considered as a principle of Scripture interpretation; but nothing can be more indefinite than the position in which he leaves the life of Christ as an actual history, and the origin of the Scriptures as historical documents. He accepts the record as current and in wide credit; and as, according to the further development of his theory, the individual who has been morally born again, requires for the strengthening of his principles a visible moral society or kingdom of God in which to enrol himself, and to edify himself by sympathy and union; and as, through an invincible infirmity of human nature, all such societies demand some positive religious histories and rites, grounded on alleged revelation, as the vehicles of the one moral religion and the statute-books of the one moral church of God, Kant regards it as matter of thankfulness that the Christian revelation so greatly excels all others in its moral contents; and he ascribes it to a working of Providence—short, however, of miracle—that this revelation has proved hitherto, and will for an indefinite period prove, able to maintain its influence as an inspired authority. Meanwhile, it is the duty of the Christian theologian and preacher to interpret the historical statements of the Christian books in a moral sense, and rather to allegorize them than offend pure reason,—in no case, however, imposing them as necessary to salvation; and it is the duty of the Christian worshipper, without expecting any special blessing from the exercises of religion as means of grace, to employ them as remembrancers of moral obligation, and thus to revive and strengthen reverence for the moral law, and to cultivate a practical disposition to regard all duties as Divine commandments. The gradual disentanglement of religion from historical dogmas and positive statutes is its moral perfection, and the advance of Christianity to this stage is its own goal, the final victory of good over evil, or the coming of the kingdom of God upon earth.

This philosophy of religion could not long satisfy men's minds, though it had great influence in confirming the anti-supernaturalist direction of the age from which it arose. A series of pantheistic schemes sprung up to reverse it, proving with how little ground Kant had appealed to his own ethical religion as a permanent and established contrast to positive Christianity. The right of licentious allegorical interpretation, in pleading for which Kant so strangely forgets the absolute imperative of the moral law, ultimately degenerated into the extravagance of the mythical theory. Schleiermacher, in so much besides the antipodes of Kant, vindicated the claims of the devotional element of our nature against the exclusively moral, and thus restored historical Christianity to its just ascendancy. And nothing has remained of Kant's influence in this department but his tribute to the moral singularity of Christianity, as the only historical religion which has exhausted the moral law; a concession which ought to have led him farther, since, in the circumstances of its origin, this amounted to nothing less than a moral miracle.

It is impossible to enter into the speculations and theories of Kant in other departments, or to narrate farther the reactions and conflicts by which his philosophy as a whole has been attended. This belongs not to the biographer of Kant but to the historian of philosophy. Taken altogether, it is

Kantemir
||
Karamsin

impossible to regard his writings as other than a prodigy of human intellect, and his influence as one of the mightiest forces that has ever ruled philosophical opinion. His mark is still on all the speculative sciences in Germany and Europe; and though his sceptre has long been broken, the most opposite systems meet in homage at his tomb. Great as the currency of his leading ideas has been, much still remains in his works to be developed by the struggle and collision of future systems; and it may be safely pronounced that no philosopher of the eighteenth century, perhaps none since the days of Aristotle, has left behind such monuments of thought, or has so firmly imposed the task of mastering them on the speculation of all succeeding ages. (J. C.—S.)

KANTEMIR. See CANTEMIR.

KANTURK, a market-town of Ireland, county of Cork, at the confluence of the Allua and Dallua, 26 miles N.W. of Cork. The town is neatly built. The principal public buildings are the sessions' house, bridewell, workhouse (covering 6 acres), parish church, and Roman Catholic chapel. The chief industrial products are beer, flour, and serges. Pop. (1851) of town, 3125; in workhouse, 3352.

KARAK, a small rocky island in the Persian Gulf, about 15 miles in circuit, in N. Lat. 29, 14., E. Long. 50, 20. On the north side is a small village with about 1000 inhabitants, who support themselves chiefly by fishing and raising fruits. Karak affords a safe anchorage for vessels at all seasons, but especially during the severe gales which blow from the N.W., and are the prevailing winds in this sea.

KARAMANIA. See CARAMANIA.

KARAMSIN, NIKOLAI MIKHAELOVITCH, the greatest of Russian historians, and one of the greatest writers that Russia has yet produced, was born in the government of Simbrisk, Dec. 1, 1765. His family belonged to the lower grades of the nobility, and Karamsin, according to the custom of his class, adopted the profession of arms. He served for some time in the imperial guards, beguiling his leisure hours in minor literary attempts, especially translations from the English and German. Quitting the service in 1789, he set out on a tour through Western Europe, and visited Germany, Switzerland, France, and England. His impressions of this tour which extended over three years, he gave to the world, in his *Letters of a Russian Traveller*, translated into German by Richter in 1804, and from German into English. On his return home he devoted himself entirely to literature, contributing industriously to the *Moscow Journal* (of which many numbers were written wholly by himself), and afterwards to the *Aglaiia*, the *Pantheon*, and the *Vestnik Evrope*. The success of his poems and miscellaneous essays in these periodicals was due to their national character and interest. His aim was to magnify his country by dwelling on her past glories and rising greatness. Themes so flattering to the national vanity soon became popular with all classes of the Russian people, and were further recommended by the elaborate care and polish of their style. In 1803 his labours were rewarded with the sinecure office of imperial historiographer, and the resources thus placed at his command inspired him with the idea of writing the history of his country. The national archives were thrown open to him; the government aided him in his researches in every possible way; and the Czar himself countenanced the undertaking by telling him that "the Russian people well deserves to know its history—a history well worthy of the Russian people." To select judiciously from the vast mass of materials placed at his disposal was itself a work of immense care; and he taxed the whole powers of his mind to fuse these selections into a harmonious whole. For thirteen years he toiled with incredible industry at his task, and in 1816 the first eight volumes of the work were ready. The Czar himself defrayed the expenses of printing and publication. The praises of the book had been sounded in every corner of

Karical
||
Kars.

the empire, and when it appeared it was eagerly welcomed by intelligent readers of every class. Its popularity was without precedent or parallel in Russian literature. Honours and rewards were heaped upon the author. He was made a councillor of state, and received from the Czar the order of St Anne, and a home in the Tauridian Palace, one of the pleasure-palaces of the Empress Catherine II. Continuing his task with renewed confidence, Karamsin had, in 1824, finished the eleventh volume, bringing down the narrative to the reign of Ivan V. Enfeebled health disabled him from carrying out his plans with his former energy, and he did not live to complete the twelfth volume, which was edited and carried through the press by his friend Bludov, minister of the interior. He died at the Tauridian Palace, June 3 (Russian style), 1826. A few days before his death, he had received from the new Czar Nicholas a flattering autograph letter, and a ukase entitling him to an annual pension of 50,000 roubles. The pension was continued to his widow and family.

Karamsin is with justice styled the father of Russian history. Neither before nor since his day has Russia had an historian worthy of the name. Judged by the standard of that country, Karamsin's history deserves all the praises that have been lavished upon it; tried by a higher standard it falls far short of them. Everywhere the style is stately and sonorous, often far too ambitious for the narrative or the thought. It does not flexibly adapt itself to the ever-varying importance of the persons or facts passed under review; and thus, to the foreign reader at least, it soon becomes wearisome from its monotony. In a historical point of view the matter of the narrative is also open to strong objections. The outlines of great characters and events are often feebly and vaguely drawn. The personages are not grouped, and the events are not marshalled, in such a way as to produce any powerful effect, or even to convey any definite idea to the mind of the reader. Salient points are missed, and points of very minor importance paraded in their place. No attempt is made to explain the causes or the consequences of events or the motives of the actors. The arrangement likewise is bad. With all these defects, however, Karamsin's work is still the only history of Russia.

KARICAL, a town of Hindustan, on the sea-coast of the province of Tanjore, 50 miles E. by N. from the town of that name. The surrounding territory produces rice and salt. Karical was granted to the French by the rajah of Travancore in 1739. The fort is built upon one of the branches of the Cavery, the mouth of which is so choked by a bank of sand, that it is only navigable for boats. In 1760 Karical was taken from the French by Colonel Monson. It has been frequently taken and retaken since that period by the contending parties, and was ceded to the French at the conclusion of the last war. E. Long. 79, 54., N. Lat. 10, 55. The population for town and territory is estimated at—Europeans 43, East Indians 71, natives 49,193; giving a total of 49,307.

KARNAK. See EGYP.

KARNATA, an ancient Hindu geographical division, which comprehended all the high table-land in the S. of India, situated above the Ghauts. The name has been transferred to the adjacent provinces on the sea-coasts of India, Carnatic, and Canara. In the remote period of Hindu history, Karnata existed as a powerful empire, which comprehended great part of the S. of India.

KARNTHEN. See AUSTRIA.

KARS, a fortified town on the frontier of Asiatic Turkey, in the province of Turkish Armenia, five days' journey from Erzeroum, seven from Batoum, and two from Gumri, in Russian Armenia; N. Lat. 40, 25., E. Long. 41, 10. Pop. about 2000 families. It lies in a loop of a cognominal river in an amphitheatre of rugged hills of black basalt, and is 4000 feet above the level of the sea. On a precipitous rock overhanging the town on the same side of the river is the

Kars. old castle, a massive building formerly the only defence of the place. The houses are mostly built of mud, although the surrounding hills furnish excellent stone, which has been turned to account in the better class of dwellings. There are no public buildings of importance, except the baths, four in number, and the mosques, of which there are twenty-four. The streets, like those of most Turkish towns, are narrow and dirty; and the people are squalid in appearance.

There are two suburbs without the walls, which may contain about one-third of the population of the city itself. That suburb known by the name of Ousta Kassi contains a population of about 500 Armenian Christian families, who are the most active traders in the town, and cherish strong Russian sympathies. With the exception of this Armenian quarter, the people are Mussulman Georgians, who have adopted a form of the Turkish language. Since their conversion to Islamism they have become mixed a good deal with Turks and Kurds. The latter people inhabit the mountains to the S.E., while the mountainous region to the N. is inhabited by a branch of the Georgian stock called *Laz*; the country itself is called Lazistan.

The town has no manufactures, and but little trade of its own; but as it is one of the stations for caravans travelling between Trebizonde and Western Persia, it has periodic recurrences of commercial activity. The interest which attaches to Kars arises wholly from the importance of its position as the key of eastern Asia Minor, and from the numerous sieges it has sustained. The castle was founded in 1586 by Amurath III. It was besieged in 1735 by the Persian conqueror Nadir Shah, who, though he utterly annihilated a relieving army of 100,000 Turks, was baffled in his attempts to take the town, and at last compelled to raise the siege. A few years later, the town fell into the hands of semi-independent chieftains, who set the Sultan at defiance. The Porte, however, compromised matters by acknowledging the title of one of these, Selim by name, and ever since his death the governor of the fortress has been nominated by the Sultan. In 1806 the Russians, under General Neswatoft, besieged Kars for the first time, but finding it stronger than they had anticipated, abandoned the attempt after a short blockade. In 1828 they again appeared before its walls, under the command of the celebrated Paskiewitsch, and after an obstinate resistance obtained possession of the town and fort. But the most famous of all its sieges is that of 1855. Under the command of General Williams, an English officer of artillery, assisted by a few Englishmen and Hungarians (among the latter of whom was the patriot Kmety), the Turkish garrison, about 17,000 strong, with scarcely any cavalry, held out against a Russian army under Muravieff of nearly 40,000, including 10,000 cavalry, for five months, amid incredible hardships. The blockade commenced on the 16th June, and, varied from time to time by skirmishes, and two attempts to gain possession of some detached forts, continued until all the Turkish cavalry was destroyed, and the garrison weakened for want of food, when a general assault was given on the 29th Sept. The Russians had calculated on taking the town by a *coup-de-main* in the early morning, but were foiled by the vigilance of the garrison. After a desperate engagement, which lasted for seven hours and a half, the Turks were left masters of the field. The Russians acknowledged the loss of 6300 men in this attack. On account of the utter want of cavalry, and the weakness, both physical and numerical, of the Turkish army, the Russians, having retired from the assault, were still able, by means of their numerous and untouched cavalry, to resume the blockade. The garrison was obliged at length to capitulate to their vanquished enemy, after having gone through such frightful sufferings that scarce two-thirds of the original numbers remained, and many of these expired after the

surrender, which took place on the 28th Nov. 1855. By the treaty of 1856 Kars was restored to the Turks. There are several good accounts of Kars. The best are Monteth's *History of Prince Paskiewitsch's Campaigns in Asia Minor*; *Narrative of the Siege of Kars*, 1856, by H. Sandwith, M.D., who was an eye-witness of the whole siege.

KASAN, a government in the eastern part of European Russia, lying between N. Lat. 54. 10. and 56. 45., and E. Long. 46. 20. and 51. 45., and bounded on the N. by Viatka, E. by Orenburg, S. by Simbirsk, and W. by Novgorod. Area 23,947 square miles. The surface is generally flat, with here and there ranges of low hills. In the S.E. are some long off-shoots of the Ural Mountains. The principal rivers are the Volga and the Kama, the former entering the government from the W., the latter from the E. They meet near the centre, and, uniting their streams, pursue a southern course into Simbirsk. Besides these, there are many smaller streams, and numerous lakes abounding in fish. The climate, although very severe in winter, is, on the whole, salubrious. The rivers are covered with ice from November to the end of March, but the rest of the year is mild, and apples, pears, cherries, plums, apricots, and other fruits, come to perfection in the open air. The soil is fertile, but agriculture is very imperfectly carried on. Sufficient crops of rye, wheat, hemp, flax, &c., are raised for home consumption. Extensive forests of pine, fir, and oak, occupy nearly one-half of the surface. Bears, wolves, and various kinds of game abound. Besides agriculture and fishing, the inhabitants find employment in the numerous distilleries, tanneries, oil and saw-mills, and potash works. Spinning and weaving are also common pursuits. Pop. (1851) 1,347,352, of whom about one-half are Russians, the rest being Tartars, Circassians, Chuvasses, &c.

The khanat, or kingdom of Kasan, was founded by the Tartars in 1441, and comprised the present Russian governments of Kasan, Pensa, Perm, Simbirsk, and Viatka. It was subjected to Russia in 1552.

KASAN, the capital of the above government, is situated on an elevated tongue of land formed by the Kasanka, and its tributary the Bulak, about 5 miles above the mouth of the former, in the Volga. It consists of three parts, the kremlin, the middle town, and the lower town. The kremlin is situated close to the steepest part of the bank, and is surrounded by a high stone wall built by the Tartars. It contains the governor's and archbishop's palaces, barracks, prisons and workhouses for criminals, and the highly venerated cathedral of the Kasan "Mother of God." In the part of the middle town which adjoins the fortress, the great size of the bazaar, and the grand appearance of some of the private houses near it, attest the rank which Kasan held at an early period. In the bazaar are seen immense piles of furs, vegetables and fruits both fresh and dried, fish, &c. The market-place is surrounded by lofty buildings for the most part of stone, and has recently been much improved in appearance by the planting of rows of trees. Many of the old churches here display elaborate execution, and some of them, perhaps, excel in this respect even those of Moscow. The lower town contains several rows of elegant houses, separated from one another by gardens, and inhabited chiefly by opulent merchants. The chief building here, however, is the university, an elegant structure of white hewn stone, having its principal fronts adorned with Corinthian columns. It contains a library of 30,000 vols., a fine collection of Russian and Tartar coins, scientific apparatus and collections, observatory, botanical garden, &c., and had, in 1854, 91 professors, and 366 students. The study of history and of the Eastern languages receive special attention here. The Tartars dwell apart from the Russians, having a settlement on the eminences which surround Lake Kaban in the vicinity. Kasan is the seat of various manufactures, as woollens, cottons, leather, soap, cutlery, &c., and carries on

Kasan.

Kaschau
||
Kasmark.

an extensive transit trade between Siberia, Bokhara, and European Russia. The town has frequently suffered from fire—three times within a century after it came into the hands of the Russians; in 1552; and, more recently, in 1774, when the ancient archives were destroyed; in 1815, when the government powder stores exploded; and in 1842, when more than one-half of the city was destroyed. Pop. (1851) 45,049.

KASCHAU (Hung. *Kassa*, Lat. *Cossovia*), a royal free city of Hungary, finely situated at the confluence of the Hernad and Csermel, in the county of Abaujvar, 125 miles N.E. of Pesth. It is enclosed by vineyards, at an elevation of 1060 feet above the sea-level, in N. Lat. 48. 39., E. Long. 21. 16. The town, which is nearly oval in shape, is well built, its streets are regularly laid out, and it is adorned with squares, and handsome buildings. The cathedral, called Elizabeth-Pfarrkirche, with its copper-covered tower, and fine internal decorations, is as old as the middle of the fourteenth century, and is the best specimen of Gothic ecclesiastical architecture in Hungary. There are thirteen Catholic, and two Lutheran churches, besides the various government houses, bishop's palace, schools, museum, library of 10,000 vols., infirmary, theatre, and aristocratic mansions. The manufactures consist of leather, hats, tobacco, woollen cloth, paper, and gunpowder. There are quarries of stone and slate, and works for making tiles and bricks. The chief trade of Kaschau is in wine. The nobility and upper classes resort to the town in the winter time. Latin, as well as German, is spoken, and both in great purity. Pop. (1851) 13,034.

KASHGAR, or CASHGAR, *The Principality of*, forms the extreme eastern frontier of the Chinese empire, and reaches on the N. to the chain of snowy mountains. Marco Polo, who visited it towards the close of the thirteenth century, describes the country as fertile, and covered with towns, but the Chinese, who conquered it in 1759, describe the soil as poor. The inhabitants are covetous and frugal in their mode of living, amounting to 60,000 families, and inhabiting 17 towns, and 1600 villages and hamlets. It is now considered a fertile country, producing corn, wine, fruits, flax, hemp, and cotton.

The town of Kashgar, in the above, on a river of the same name, is the most westerly place of importance in the Chinese empire. It is situated in N. Lat. 39. 28., and E. Long. 73. 55., 140 miles N.W. of Yarkand, and 2300 W. of Pekin. The town, which is built of brick, is surrounded with an earthen wall pierced by four gates. The citadel is strongly garrisoned with Chinese troops. The part of the town not held by the Chinese is occupied by Mohammedans, and a few Nestorians. A considerable trade is carried on between Kashgar and Bokhara, the former affording silks, porcelain, rhubarb, and tea; while from the latter are imported woollen cloths, cloth of gold, velvet, mirrors, ploughshares, and various other articles of merchandise. The merchants of Kashgar are described as rich and luxurious, while the artizans are skilful in their various works and manufactures.

In ancient times Kashgar was called *Sule*, and is mentioned as having been an important commercial city before the Christian era. After being the residence of an independent prince, it fell into the hands of the Karakityan khans, then of the Jagatayan khans, and was captured by the Eluths towards the close of the seventeenth century. In 1759 it was taken by the Chinese, and during the first quarter of the present century it contained 10,000 houses, while its trade was estimated at upwards of 700 camel loads annually. But both its importance and its trade were diminished by the rebellion which broke out in 1826. Pop. 16,000, exclusive of the Chinese garrison of 8000.

KASMARK, a free town of Northern Hungary, county of Zips, on the right bank of the Poprad, 125 miles N.E.

of Pesth. It is an old-fashioned town, with three gates, but its walls have for the most part been removed. It has considerable manufactures of linen and woollen stuffs, and some trade by means of the river, which also affords good salmon fishing. Pop. 4500.

Kassimow
||
Kattywar.

KASSIMOW, a town of European Russia, capital of a cognominal circle, in the government of Riazan, and 70 miles E.N.E. of the town of that name. It stands at the junction of the Rivers Babinka and Oka, and is surrounded by a wall which has been formed into a pleasant promenade. The houses are mostly of wood. It carries on a considerable trade with the East in furs, silk, and cotton goods; and has some manufactures of cloth, leather, earthenware, &c. Under Tartar rule, it was a place of some note, having been the capital of a prince of that race. Some of the original Tartar inhabitants occupy one of the suburbs. Pop. (1849) 7781.

KASTAMOUNI, or COSTAMBONE, a town in Anatolia, in Asia Minor, in N. Lat. 41. 22., and E. Long. 33. 55., about 230 miles E. of Constantinople, 115 miles N.N.E. of Angora, 50 miles S. of the Black Sea, and situated 2350 feet above the sea level. It stands in a dreary hollow, from which rises a solitary rock surmounted by a fortress in ruins. The houses are two stories high, but ill-built, and the streets are both dirty and narrow. The town contains 30 mosques, 4 monasteries, and 24 baths. The trade, which is considerable, consists in wool, copper, cotton, and sails for shipping. It is said there are 32 printing-houses for cotton, 22 dyeing houses, and 2 tanneries. During the Greek empire, the fortress was in possession of the Comneni. It was taken by Bajazet, retaken by Timour, and, lastly, conquered by Mohammed I. Pop. 48,000.

KATRINE, LOCH (i.e., Lake of the Caterans or Plunderers), one of the most celebrated lakes in Scotland, is situated in the S.W. of Perthshire, 9½ miles from Callander. It is about 10 miles long, 2 broad, and of great depth. It is surrounded with lofty mountains, of which the most prominent are Benvenue and Ben-a'an, the sides of which are indented with picturesque ravines and wooded dells. The lake is fed by the numerous torrents which come down from the mountains, and it discharges its waters through the wild pass of the Trossachs to join Lochs Achray and Venacher, which flow into the Teith. About half-a-mile from the shore is Eilan Varnoch, to which the plunderers used to drive their booty, and which occupies a conspicuous place in the *Lady of the Lake* as Ellen's Isle. Since 1846 a steamer has plied upon the lake, for the convenience of tourists.

KATTYWAR, a province of Hindustan, comprehending the whole of the peninsula of Guzerat, bounded on the N. and N.W. by the Runn and the Gulf of Cutch, on the S.W. and S. by the Arabian Sea, on the E. by the Gulf of Cambay and the British district of Ahmedabad. It is divided into twelve districts, which are again subdivided into the separate possessions of a host of Hindu chiefs, some of whom are tributary to the British government, others to the Guicowar. The Peishwa formerly claimed very considerable tributary rights in Kattywar, and the destruction of his power and sovereignty by the British transferred them to the latter. In this manner did the British government acquire superiority over part of the chiefs above mentioned; and it being found inconvenient that two authorities should exercise the power of levying tribute, all have been placed under the control of that government, by whose agency the entire tribute is now collected, the Guicowar's share being accounted for to that prince. The number of chiefs amounts to 216; their total revenue to L.450,172, of which L.104,739 is paid as tribute, leaving a residue of L.345,433. The chiefs are left in a large degree of independence. A criminal court has been established for the trial of more serious offences, through the agency of the British resident

Kavala
||
Kean.

but the native chiefs of the several states sit therein as assessors. The area of the Kattywar is returned at 19,850 square miles, with a population of 1,468,900.

KAVALA, or **CAVALLO**, a seaport town of European Turkey, in the S.E. of Macedonia, opposite the island of Thasos in the Ægean Sea. It is surrounded by walls, and is farther protected by a citadel. The harbour is small, but a considerable trade is carried on, cotton and tobacco being the chief exports. Kavala was the birth-place of Mehemet Ali, the late Pasha of Egypt. Pop. about 4000.

KAYNS, **KIATNS**, or **CARIANERS**, a singular tribe who inhabit that mountainous and woody tract which lies between Bengal, Aracan, Ava Proper, and the province of Munipoor or Cassay. They are represented as a simple, innocent race, speaking a language distinct from that of the Burmans, and entertaining rude notions of religion. Their habits are altogether pastoral, and they are the most industrious subjects of the state. Their villages form a select community, from which they exclude all other sects, and in no case reside in any city, or marry or intermingle with strangers. They profess and practise the doctrine of universal peace, never engaging in war, nor taking any part in contests for dominion. They devote themselves to agriculture, the care of cattle, and the raising of poultry. Almost all the provisions used in the country are raised by this tribe, and they particularly excel in gardening. They have of late years been oppressed and heavily taxed by the great Burman landholders, and have in consequence withdrawn into the mountains of Aracan. They have no written laws, but are guided by immemorial custom, which stands in the place of law. Some learn to speak the Burman tongue, and a few can read and write it imperfectly. They are (says Symes, in his account of his embassy to Ava) timorous, honest, mild in their manners, and exceedingly hospitable to strangers.

KAZEROON, a town in the province of Fars in Persia, 60 miles W. of Shiraz, in N. Lat. 29. 35., E. Long. 51. 33. It is a strongly fortified place, situated in a fine valley, and stands 2800 feet above the sea level. It has manufactories for cotton, and carries on trade with Shiraz, and is a good mart for horses. Its population has dwindled down from 50,000 to 5000.

KEAN, **EDMUND**, one of the greatest of English tragedians, was a native of London. His biographers assign the November of 1787 as the date of his birth, while he himself maintained that he was born on the 17th of March, 1790. His parentage is equally dubious. Who his father was is quite unknown; his mother seems to have been a Miss Carey, a descendant of the reputed author of the *National Anthem*. When a mere infant he appeared on the stage in the shows and pageants of the fairy-pieces and pantomimes. As he grew up his taste for acting increased with his years, and by the time he was seventeen he had wandered over England, Scotland, and Ireland with a strolling company, and played in every character from Richard III. down to harlequin in the pantomime. He soon discovered that tragedy was his forte, and the flashes of genius with which he sometimes astonished his rustic audiences were taken by his fellow players as an earnest of future eminence. His readings in Milton and Shakspeare attracted the notice of Dr Drury, head-master of Harrow, who interested himself in the young actor's destiny, and sent him to Eton, where he studied, though with moderate success, for about three years. Again he resumed his wandering life, visiting the principal cities in the United Kingdom, and playing with increasing success in Shylock, Hamlet, Richard III., and other Shakspearian characters. In 1813 Dr Drury's influence secured him an engagement at Drury Lane, where he made his débüt, January 25 of the following year, as Shylock. The house was thinly attended, but he was applauded to the echo. The critics pronounced

Keats.

him the greatest tragedian of the age, and next morning, like Byron after the publication of *Childe Harold*, "he awoke and found himself famous." His Richard III., Othello, Sir Giles Overreach, and Zanga, gained him fresh laurels, and he was everywhere hailed as a worthy rival of the Kembles and their school. For several seasons his star continued to rise; and had his personal character corresponded at all with his professional eminence, he might have divided the honours and rewards of social life with the most respected actors of the day. But he was a man of no education, and in early life had contracted many vicious tastes and habits, which seemed to grow upon him with his years. Finding it necessary to quit England for a time, he visited America, and on returning he failed to reinstate himself in the high place he had once held. Dissipation and imprudence precipitated his fall, and finally destroyed his health, and on the 15th May 1833, he died a perfect wreck at Richmond, where he had latterly become manager of the theatre.

The genius of Kean was first fully recognised and insisted upon by Hazlitt. It was in all respects a complete contrast to that of the Kemble family, being impulsive, fiery, and startling. Though he played in a greater variety of character than Garrick himself, whom he resembled in the diminutive slowness of his person, the range of his real eminence was very narrow. The parts in which he excelled, Shylock, Richard III., Othello, Sir Giles Overreach, and Zanga, were probably never played as they were played by him; but in his most ambitious efforts, such as Brutus, Coriolanus, Hamlet, Lear, and Wolsey, he was left far behind by John Kemble. In his own walk, however, he has never had a rival. In the depth, the tragic force, the terrible intensity of his acting, he overleapt the barriers of art and training, and rose to heights which genius only could have dared.

KEATS, **JOHN**, was born in London on the 29th of October 1795. His father married the daughter of his employer, Mr Jennings, the proprietor of large livery-stables in Moorfields. The offspring of this marriage were George, who afterwards emigrated to America, John, Thomas, and a sister several years their junior. John at an early age was sent, along with his brothers, to Mr Clarke's school at Enfield, where the three boys distinguished themselves by their strong pugilistic tendencies and general fierceness of disposition. They fought with every school-fellow who felt inclined to gratify them; and when no foe was procurable they supplied the deficiency in the best manner they could by fighting with one another. This pugnacious spirit was, however, in John combined with a passionate tenderness; he gave way on the slightest occasion to hysterical bursts of laughter and tears; and when, after a lingering illness, his mother died, to whom he was fondly attached, he hid himself in a nook under his master's desk for several days, and gave himself up to uncontrollable grief. His career at school was not for some time particularly remarkable; he learned his lessons with ease and kept a respectable position, but did not seem desirous to outstrip his fellows. Suddenly his ambition awoke; he determined to carry off the prizes in literature as well as in boxing, and, by dint of energy and sacrificing to his studies his walks and even his half-holidays, he succeeded. During this burst of industry at Enfield he translated the twelve books of the *Æneid*. On the death of his father the family were consigned to the guardianship of Mr Abbey, a merchant, and a sum of L.8000 was left to be divided amongst them. Keats was designed for the medical profession, and after leaving school he was apprenticed for five years to Mr Hammond, a surgeon, at Edmonton. Living in the vicinity of Enfield, he still remained on terms of intimacy with the family of his former instructor, and found in his son Charles (since favourably known in litera-

Keats.

ture) a congenial and profitable companion. An ardent friendship sprang up between them; they walked together, talked together about the poets, and sometimes continued their readings of Chaucer and Spenser from evening till daylight. It was the study of the latter poet which seems to have first impelled Keats to original composition, and the influence of his favourite may be traced throughout all his productions. On the termination of his apprenticeship he removed to London for the purpose of walking the hospitals, and soon made the acquaintance of Mr Leigh Hunt, then editor of the *Examiner*, and subsequently that of Haydon, Hazlitt, Shelley, and others. Encouraged by the praise of his friends, he published his first volume, which, out of his own immediate circle, found few readers. The disease of his family beginning to manifest itself, he was advised to leave London, and while wandering about England—by his correspondence we trace him to the Isle of Wight, Margate, Oxford, and Canterbury—he was busy with the composition of *Endymion*. This, his first poem of any considerable length, was completed in November 1817, and published in the following year, with a very remarkable preface, exhibiting the earnestness with which he strove to perfect himself in his divine art, and giving utterance to a proud yet humble belief in his future fame. Its appearance was the signal for an assault in the *Quarterly* more than usually truculent, even in those days, when the reviewer wrote inflamed with political animosities, and when his pen was a tomahawk. *Blackwood's Magazine* in its turn emptied on the head of the poet all the vials of its wrath. Nothing was spared. His literary associates, his family, his private affairs, his profession, and even his name were made the subjects of the coarsest ridicule. Nor is this much to be wondered at. Keats had allied himself with a political party especially obnoxious to the Tories. Hazlitt and Hunt stank in the nostrils of Blackwood and the *Quarterly*, and their literary offences were equally unpardonable with their political ones. If the truth must be told, there was in the whole "Cockney School," as it was then called, a good deal of effeminacy and puerile sentimentalism. Hunt, its chief leader, was an apostle of cheerfulness and universal benevolence, and seemed to look upon fine scenery as only a more exquisite place for pic-nics. From their peculiar circumstances they lived very much in the society of one another; they "babbled of green fields," of streams, of flowers. They wrote sonnets to one another, sent one another bouquets of roses and baskets of fruit, they wreathed crowns of ivy and placed them on one another's foreheads. Although nothing could be calmer and nobler than the temper of Keats' mind, or more resolute than his purpose to cultivate himself to the utmost, he did not altogether escape the taint of weak sentiment. His first volume, although it contains one of the grandest sonnets in the language, and although the reader is every now and again delighted with fresh and unexpected beauties, is exceedingly crude and immature. The poet maunders about flowers and streams; he weeps for the mere delight he has in weeping, and disports himself in the strangest and uncouthest phraseology. *Endymion*, perhaps the richest poem in colour and music given to the world since the *Comus* of Milton, is far from being perfect. The reader is smothered in roses. The story is lost in ornament. You cannot see the string for the beads. The charm lies in single lines—seldom in linked and sustained passages. It is full of the same barbarous and dissonant diction, the same lax and nerveless versification, which disfigured his earlier productions. He still wrote in a style of babyish effeminacy about

"Plums

Ready to melt between an infant's gums."

These and lines of a similar nauseous sweetness are of the most frequent occurrence.

Keats.

Shortly after the publication of *Endymion*, Keats, accompanied by his friend and correspondent, Mr Brown, started on a pedestrian tour through the north of England and Scotland. His chief object was, of course, to re-establish his health, but he also hoped, by familiarizing himself with the stern and gloomy scenery of a mountainous region, to raise his mind to the proper elevation, and to furnish him with fit imagery for a story of the fallen Saturnian gods; for at this time he had already planned *Hyperion*.

The travellers, disappointed in meeting Wordsworth at the Lakes, bent their course to Scotland, where everything connected with the memory of Burns interested them; and it is characteristic of Keats that he made a point of writing a sonnet in the cottage where the great poet was born. They visited Ireland, but soon returned to Ayrshire, and pursued their course northwards, touched at Staffa and Iona, and penetrated as far as Inverness. From this point, a severe cold caught on the road and unfortunately resulting in inflammation of the throat, determined Keats to return to London. On his arrival he was shocked to find his younger brother at the point of death; he hurried down to Teignmouth, and brought the invalid to London, who, however, survived the removal only a few days. This event, in which the poet read a prophecy of his own fate, threw a deeper shade of despondency over his mind.

Immediately after his brother's death may be dated the beginning of the passion which throws such a tragedy over the closing months of his career. Calling on one occasion at a friend's house, he met a young lady, who, on account of some misunderstanding with her relatives, had come to reside there. Her beauty seems to have made an indelible impression on his mind. From her rich Eastern look he always called her "Charmain," and wrote to his brother George, then in America, "When she comes into the room she makes the same impression as the beauty of a young leopardess." Her name, and the wildest reference to her, are constantly appearing in his correspondence, and towards the close of his life the remembrance of her love and beauty, and his inexorable disease, seems to have burned up his very existence. In the fierce alternations of passion, in failing health, and harassed by pecuniary difficulties, he was busily engaged in the study of *Paradise Lost*, filling his ear with the organ-music of Milton, and preparing his last volume for the press, containing his odes on the "Nightingale" and the "Grecian Urn," the poems of "Lamia," "Isabella," the "Eve of St Agnes," and the fragment of "Hyperion." In the midst of his labours he returned home late one night in a state of great excitement. He said he had been on the stage-coach, and had been chilled by the night air. He was persuaded to go to bed, but had scarcely laid down when he coughed, and said, "Bring me a candle." A light was brought, he looked at the dark stain on the white pillow for a few moments in silence, his surgeon's knowledge told him the fatal truth, he turned to his friend, and said calmly, "I know the colour of that blood, it is arterial blood, I cannot be deceived in that colour. That drop is my death-warrant, I must die." Getting rapidly worse, he was advised to winter in a more genial climate; and, in the autumn of 1820, Keats, accompanied by his friend Mr Severn the artist, whose name will be for ever famous in the annals of friendship, sailed for Italy. In the Bay of Biscay they experienced a severe storm. "Water parted from the sea," said Keats, as a wave deluged the cabin. When he reached Naples his sufferings were aggravated by a ten days' quarantine. Goaded by disease, and his own thoughts, he hurried to Rome, where every kindness and attention were shown him by Dr Clarke (now Sir James); and Mr Severn was never absent from his bedside day nor night. While at Rome, Keats suffered much from want of sleep, and would rave about his beloved

Keats. friends in England, of the happy hours he spent in their society, but chiefly about *her*. Once in a moment of good spirits, and when full of merry talk, he was seized with a paroxysm of coughing, and vomited a large quantity of blood. He never rallied after. One night he told his friend, he wished this inscription to be placed on his gravestone, "Here lies one whose name was writ in water." On the 23d of February he started from sleep crying, "Severn—I—lift me up—I am dying—I shall die easy—don't be frightened—be firm and thank God it has come." He was lifted up, "the phlegm boiling in his throat," his agony shortly after decreased, and he died quietly as if in slumber. After his death his body was opened, his lungs were found completely gone, and his physicians expressed their surprise that he should have lived so long. He was buried in the Protestant cemetery. "Enough to make one in love with death," says Shelley, "to think that one should be buried in so sweet a place." Many of the English residing in Rome at the time followed Keats to his grave.

After Chatterton, Keats is the most extraordinary phenomenon in our poetic literature; and, had life been granted him, there is reason to believe he would have taken his place in the very first rank of English poets. Misunderstood at the time, and supposed by many to be a sentimental weakling, oppressed by adverse circumstances, and bowed down by a mortal disease, his mind was of the noblest strain. His ambition was lofty, but he duly estimated his own powers and the difficulties he had to encounter; he shrunk from no labour, and gathered ardour from defeat. Those who are accustomed to consider him a poetic visionary,—who turned from the realities of life to shed melodious tears over morning roses, and to fall into unnatural extasies at the sight of beautiful women, will be surprised to find in his letters warm human sympathies, practical sense, clear judgment, a considerable knowledge of mankind, and a healthy contempt of everything mean and degrading; they will see the sun of a strong intellect, rising out of the coloured mists of fancy and sentiment, consuming them in its path, and will be led to form the highest anticipations of the day which would have followed, had not the luminary been arrested by the hand of death just when it emerged full-orbed above them all.

The advance from *Endymion* to *Hyperion*, taking into consideration the shortness of the time in which it was accomplished,—about three years,—is without a parallel in our literary history. The glorious and uncultured profusion of the earlier poem is displeasing to a pure taste, from its very flush of colour and excess of sweetness. All form and outline are lost in the exuberance of ornament. In his latter poems, *Hyperion* especially, he had learned to husband his strength, and had acquired that last gift of the artist, to know where to stop. There is no excess, nothing extraneous, everything is clear and well-defined, as the naked limbs of an Apollo. He had overcome, too, the fopperies of style, the taste for conceits and fantastical diction so characteristic of the poets amongst whom he lived, and which so often marred the beauty of his earlier performances, and had gained a noble simplicity, and a pomp and depth of music which seems caught from the "far-foamed sea sands." One could hardly have expected that the florid and luscious fancies of *Endymion* should have ripened into the terrible power which gave us the picture of the fallen gods, stretched here and there on the flinty rocks, and veiled with everlasting twilight,—

"Their clenched teeth still clenched, and all their limbs
Locked up like veins of metal cramped and screwed."

The same wonderful artistic sense is exhibited in the *Eve of St Agnes*. It is rich in colour as the stained windows of a Gothic cathedral, and every verse bursts into picturesque and graceful fancies; yet all this abundance is so subdued

VOL. XIII.

and harmonized in such wonderful keeping with the story Kedarnath and the mediæval period, as to render it a perfect chrysolite—a precious gem of art. Perhaps the most exquisite specimen of Keats' poetry is the *Ode to the Grecian Urn*; it breathes the very spirit of antiquity,—eternal beauty and eternal repose.

In one of his letters, Keats gives utterance to the hope, that "after his death he would be among the English poets." This anticipation has been abundantly verified. Even in his lifetime the tide had turned in his favour. The late Lord Jeffrey, in 1820, after regretting that his attention had not been earlier turned to the book, remarks, that "*Endymion* is, in truth, at least as full of genius as absurdity;" and concludes, "We are very much inclined, indeed, to add, that we do not know any book which we would sooner employ as a test to ascertain whether any one had in him a native relish for poetry, and a genuine sensibility to its intrinsic charm." With but one or two exceptions, no poet of the last generation stands at this moment higher in the popular estimation, and certainly no one has in a greater degree influenced the poetic development of the last thirty years. (A. S.—H.)

KEDARNATH, a celebrated place of Hindu pilgrimage in Northern Hindustan, situated in the mountains of Gurwhal. Those who perform this difficult pilgrimage have to travel over the most steep and inaccessible roads, which, during half the year, are blocked up with snow. The place lies about 14 or 15 miles of direct distance W.N.W. of Bhadrinath. The ceremonies observed here are nearly the same as at other places of Hindu ablation. The most peculiar of these is that of the widows shaving their heads, having previously bathed and purified themselves in the Ganges, which is here a narrow stream. N. Lat. 30. 44., E. Long. 79. 17.

KEDGELEE, a town of Bengal, situated near the mouth of the Hooghly, where ships frequently stop either in entering or going out of the river. The river here expands to a breadth of nearly 9 miles across. It is esteemed healthier than Diamond Harbour. The first section of telegraphic communication in India extended from this place to Calcutta, a distance of 40 miles. Lat. 21. 53., Long 88.

KEDJE, or KEDGE, in Beloochistan, the capital of Mekran, is situated on the Mooleanee River, in N. Lat. 26. 20., E. Long. 62. 15. It is defended by a strong fortress on an eminence, on three sides of which the town is built. It once contained 3000 houses, and carried on considerable trade, which has fallen off since the Khan of Kelat ceased to protect commerce.

KEELING, or COCOS ISLANDS, a group in the Indian Ocean, in S. Lat. 12. 5., E. Long. 96. 53., consisting of a circular chain of small coral islands, enclosing within them a spacious harbour called Port-Albion. Those islands, of which the chief are Horsburgh and Keeling, are inhabited by Malays and a few English, and covered with numerous cocoa nut and other trees. They were discovered by Keeling in 1609.

KEFIL, a village of Irak Arabi, held in peculiar veneration both by Jews and Mohammedans as the tomb of the prophet Ezekiel, and hence a frequent resort of pilgrims. It is 14 miles S. of Hillah.

KEHL, a town in Baden, on the right bank of the Rhine, where that river is crossed by a bridge of boats, situated in N. Lat. 48. 36., E. Long. 7. 52., and directly opposite Strasburg. It was at one time a bulwark of Germany, and, having been taken by the French, was fortified by Vauban. It has been frequently taken and retaken since, but now the fortifications are dismantled. The inhabitants are employed mostly in the transit trade. Pop. 1500.

KEIGHLEY, or KEITHLEY, a market-town in the West Riding of Yorkshire, situated in a deep valley, near Black-

Keith
||
Kelat.

stone Edge, on a little stream which runs into the Aire, 44 miles W. of York, and 204 from London by the Great Northern and Midland line. Although containing many fine stone houses, yet, as a town, it is not regularly built. The parish church, a large handsome building, occupies the site of one erected during the time of Henry I. The living, which is a rectory, is in the power of the Duke of Devonshire. There are also places of worship for the Independents, Methodists, Wesleyans, Baptists, Quakers, and Swedenborgians. Keighley has a neat court-house, a mechanics' institute, a market-place, a library, a savings bank, and several national schools. The manufactures consist of coarse stuffs, merinos, and worsted yarns. The various mills employ upwards of 2000 people. The canal which joins this town with Hull and Liverpool affords a cheap means of transit for goods. Market-day, Wednesday. In 1645 Keighley was the scene of a battle between the royal and parliamentary forces. Pop. (1851) 13,050.

KEITH, a market-town in Banffshire, 20 miles W. of Banff, situated on the Isla, and consisting of three villages, Old Keith, New Keith, and Fife Keith, all surrounded by hills. Old Keith is very ancient, irregularly built, and mean in appearance; New Keith contains a market-place, a parish church, an Episcopal and a Roman Catholic chapel, and meeting-houses for other denominations, a court-house, several branch banks, libraries, and schools. Fife Keith, connected with Old Keith by two bridges, is a finely built village, and dates from 1816. The inhabitants are engaged in weaving and bleaching, and also in manufacturing woollens, linens, and tobacco. Before the introduction of railways Keith was the chief starting point for cattle-dealers going to the south. At Old Keith the forces of the Pretender, in 1745, gained an advantage over the Royalists. In the neighbourhood Ferguson the mechanical philosopher was born. Markets weekly. Pop. (1851) 2101.

KELAT, a city of Asia, the capital of Beloochistan, and thence called Kelat, or the city. Its situation is elevated on the western side of a well-cultivated plain or valley, about 8 miles in length and 2 or 3 in breadth, the greater part of which is laid out in gardens and other enclosures. The town is built in the form of an oblong square; three sides of it are encompassed by a mud wall 18 or 20 feet high, flanked at intervals of 250 paces by bastions, which, as well as the wall itself, are pierced with numberless loop-holes for matchlock-men; but no cannon are now mounted. The defence of the fourth side of the city is formed by the western face of the hill on which it is built, being cut away perpendicularly. There are within the walls 2500 houses, without the wall, 1250. They are built of half-burnt brick or wooden frames, and plastered over with mud or mortar; the streets are broader than those of native towns, and have mostly a raised pathway on either side for foot passengers, and an uncovered kennel in the centre, which is a recipient for all filth, and dirt, and stagnant water. The upper storeys of the houses also stretching across the streets, render the part beneath them gloomy and damp. The palace of the chief of Kelat stands on the summit of the hill on which the city is built. Viewed from the outside, it appears an irregular heap of common mud buildings, with flat roofs, forming terraces, protected by low parapet walls pierced with loop-holes. The quarter on which the khan's residence is erected has been enclosed by a mud wall with bastions. The bazaar of Kelat is extensive, and well furnished with every kind of goods, and with provisions of all sorts, which can be procured at a moderate rate. The town is also supplied with delicious water, from a spring in the face of a hill on the opposite side of the plain, whence it meanders through the centre of it. The inhabitants of Kelat may be divided into four classes, namely, the Beloochees or Brahoos, Hindus, Afghans, and Dehwars. The latter are the principal merchants of the place, and are therefore encouraged

Kelat
||
Kellermann.

by the chief. On the invasion of Afghanistan by the British in March 1839, Mehrab Khan, the ruler of Beloochistan, was considered to evince such hostile feeling towards the British, as required that he should be chastised, and rendered incapable of future mischief; and in the following November, on the return of the Bombay column from Cabul to Scinde, Major-General Willshire was detached from Quetta against Kelat. One of the gates was knocked in by the fire of the horse-artillery guns which accompanied the force, and the town and citadel immediately stormed, the Khan being killed fighting sword in hand, and with him above 400 of his troops; nearly all the rest, amounting to about 2000, were made prisoners. The British force on this occasion consisted of 1261 men. Their loss was 31 killed and 107 wounded. In the following year, a weak garrison of sepoys was overpowered by some insurgent Beloochees, who made themselves masters of the town, deposed the chief placed in power by the British, made prisoner the British officer in command, and subsequently put him to death. In the close of the same year, the place was retaken by General Nott. In 1841 the British government recognised as ruler Nasir Khan, the youthful son of Mehrab Khan, and subsequently withdrew their troops from his dominions. The population of the town and suburbs is about 12,000. Lat. 28. 52., Long. 66. 29.

KELAT, or *The Fortress*, is a singular valley in the province of Khorassan, in Persia, which extends, in a direction nearly E. and W., from 50 to 60 miles in length, and from 12 to 15 in breadth, situated amongst the hills that divide the plain of Mushed from the desert. It is surrounded by mountains so steep and difficult by nature as to be almost impassable, and they have been rendered completely so by art. The rocks, says Fraser, are scarped in the outside, presenting a mural appearance, so that there is no possibility of scaling them; and beyond these is a lesser range, with a hollow between, which the natives call the ditch. Not less care has been taken in the inside to increase every natural difficulty, so as to render a descent into, or an escape from, the valley equally impracticable. There are two openings in this valley, one at the western and one at the eastern extremity. These openings, which are both narrow and intricate, are called the *gates* of the fortress, and have been built up and fortified in such a manner that it is impossible to force an entrance. On these fortified gateways there are towers where watchmen are continually posted to give warning of all who approach, and none are admitted except those who have passed from the end of the valley. In this valley there is a great deal of cultivation, and its population amounts to 2000 families. It was in this stronghold that Nadir Shah intended to deposit his vast treasure. Futeh Allee Khan was placed in command of the fortress by Allee Shah, after the death of Nadir, and was killed in a brawl which subsequently took place. His son succeeded in putting the murderer to death, and he has ever since retained possession of the fortress. He is an independent chieftain, possessed of 1000 horse and 2000 foot, and can considerably increase the number by arming his villagers. As he is, besides, on good terms with the Turkomans of the desert, he can always command a large force of their cavalry.

KELLERMANN, FRANÇOIS-CHRISTOPHE, Duke of Valmy, one of the most distinguished generals of the French Revolution, was born at Strasbourg in 1735. Choosing the career of arms, he rose slowly through the various grades, and when the Revolution broke out he obtained a command in the army of the Moselle. The Duke of Brunswick, with an army of 60,000 Austrians and Prussians, was then advancing towards the French frontier, and the raw levies of the republic were vastly inferior, both in number and discipline, to his well-trained warriors. Success at first attended his manœuvres, and Kellermann was cut off from

the main body of the French under Dumouriez. By forced marches he effected a junction with the commander-in-chief on the 19th September 1792; but taking up a position different from that which had been assigned to him, he found himself on the following morning on the plateau of Valmy, "projected like a cape into the midst of the lines of the Prussian bayonets." In this position the French maintained a desperate struggle during the whole day, and being reinforced at night by Dumouriez, they drove the Prusso-Austrian troops from the field. The victory of Valmy is memorable as the first of that great series of victories achieved by the arms of revolutionary France. Goethe, who was present during the engagement, told the troop to which he was attached, "From this place, and from this day forth, commences a new era in the world's history; and you can all say that you were present at its birth." Professor Creasy has given Valmy a place among the fifteen decisive battles of the world. The victor of that day afterwards rose to still higher commands in the French army, and, in 1795, became general-in-chief of the armies of the Alps and Italy. Under Napoleon, he rose to be a peer and senator of the empire; and when the Bourbons were restored, he continued to retain office under them. He died in 1820; and, in accordance with his last wishes, his heart was buried in the field of Valmy, the scene of his greatest triumph.

KELLS (originally *REULIS*), an ancient market-town and municipal burgh, county Meath, Ireland. It is pleasantly situated on the Blackwater, 36 miles N.W. of Dublin, but is, for the most part, meanly built and dirty. Amongst the antiquities of the town and neighbourhood are the old church, a round tower 99 feet high, a richly carved cross, and some remains of a monastery, said to have been founded by Columba in 550. In the neighbourhood is the seat of the Marquis of Headfort. Pop. 3997.

KELP. See *GLASS*, § *Manufacture of Crown Glass*.

KELSO, the county town of Roxburghshire, Scotland, is picturesquely situated at the confluence of the Tweed and Teviot, 23 miles S.W. from Berwick. The general aspect of the streets is clean and agreeable; and the market-place, a spacious square in the centre of the town, has a highly respectable appearance. Towering above the modern edifices are the majestic ruins of the abbey, founded by David I., and demolished by English invaders in 1545,—one of the noblest extant relics of the early Norman style. Over the Tweed is a handsome bridge by Rennie. Kelso is well furnished with schools and libraries, and has two newspapers. It was the first provincial Scottish town that could boast of a printing press. The manufactures are unimportant. Shopkeeping and agriculture are the main sources of employment. There is a weekly corn-market, and the principal fair in the S. of Scotland, St James' Fair, is held here in August. In the vicinity is a fine race-course. About a mile from the town, on a commanding eminence, are the ruins of the once strong castle of Roxburgh, fronting which, to the N., is the magnificent modern residence of the Duke of Roxburgh, *Fleurs Palace*. Two miles to the N. is the village of Ednam, the birth-place of the poet Thomson. Pop. 4783.

KEMAON, or **KUMAON**, a district of Northern Hindustan, which was formerly a Hindu principality, contiguous with that of Duti on the E., the boundary line being the Cali River. On the W. it was separated from Gurwal by the Ramgunga, and extended a considerable way into the plains of Bareilly. The modern district of Kemaon, as it has been regulated by the British since its conquest in 1815, comprehends the whole tract of country between the Aluknunda and the Cali, from the plains to the highest pinnacle of the Himalaya, which space includes a large portion of the Gurwal province S.E. of Alcananda, whilst the Cali River on the E. forms a natural and well-defined boundary towards Nepal. The geographical divisions are

Kemaon Proper, and British Gurwal, within the limits of which latter is the Pass of Niti, supposed to have been the earliest and most frequented route into Chinese Tartary. Area 7000 square miles.

Kemaon is situated amongst the lower ranges of the Himalaya Mountains. It is separated from the lower districts of Bareilly and Morabad by a thick forest of nearly two days' journey, which surrounds the whole and skirts the margin of the mountains. The soil is marshy, and the atmosphere, during two-thirds of the year, is more pestilential than that of the Sunderbunds; it is, says Heber, "a literal belt of death, which even the natives tremble to go near, and which, during the rains more especially, the monkeys are forced to abandon. After the middle of November this is dry, practicable, and safe." Kemaon Proper is separated on the N.W. from the province of Gurwal by a range of mountains, which, in point of ruggedness, presents a contrast to the hills of Kemaon. These latter appear to rise in a regular gentle acclivity from their bases; and the soil is fertile, consisting of rich earth, which gives nourishment to fine verdure and extensive forests. The hills are also intersected by rather spacious valleys, rendered fertile by tillage; and the cultivation is more extended, and carried farther up the hills, than in Gurwal with a denser population. In these valleys, rice is produced in abundance, and the cultivator is thus in a manner rendered independent of the seasons, as the numerous mountain-streams, descending in every direction, enable him to irrigate all the lower lands. The higher lands produce wheat, barley, and various small grains, which being raised in a redundant quantity, form an article of traffic with Bhutant. There are several passes into Kemaon from the districts of Bareilly and Morabad, but those leading through Cossipoor and Roderpoor are considered as the best, and are most frequented. The first leads by Chilkeah, where an annual fair is held, to which the hill people resort in great numbers. Similar meetings also occur at Bhagesur, on the banks of the Cali, each continuing ten days, and are frequented by merchants from Bhote and the low countries. Chilkeah is one of the principal marts of trade in Kemaon, and through that country into Thibet and Tartary. The article which meets with the readiest sale is cloth with distinct colours on each side. European articles of a coarse quality are also in demand, such as knives, razors, wine-glasses, tumblers, spying and looking glasses, spectacles, and cheap enamelled watches; and Bishop Heber also saw exposed to sale English cloths and Eastern shawls of good appearance, with many other serviceable and valuable commodities. The greatest staple that is exported from this southern frontier has always been timber, found in the immense forests already mentioned, which skirt the border. Here the saul forests are of great extent, and produce some of the best timber of that species in India. Owing to the difficulty of access, it is necessary to convert the trees into planks on the spot, that they may be the more easily transported to the populous parts of the country. In some parts they have to be carried down a perpendicular height of 500 feet. The fir-tree grows to an immense size, and it is much stronger than the firs of Europe, and as heavy as teak, the grain strong and full of turpentine. Some of the trees have from 60 to 70 feet clear of branches, and the spans are from 20 to 23 inches in diameter. Rosin, turpentine, doedwar, oil, and hemp of an excellent quality, are to be found among the Kemaon Hills. The bamboo, though small, grows remarkably tough, and seems to gain consistency and soundness from a certain degree of frost. The same is said to be the case with the plantains. The tea-plant grows wild all through Kemaon, but cannot be made use of, from an emetic quality which it possesses. The upper mountains produce copper, lead, iron, and the Panar River gold, but there is no mine of consequence. The northern parts are

Kemaon. cold, and yield pasture for numerous flocks of sheep; and in summer a considerable intercourse is carried on with the country subject to China.

The towns and villages of Kemaon, when viewed from a distance, present a neat appearance. But a nearer approach does not confirm these favourable prepossessions. They are generally surrounded by dirt and filth; though Bishop Heber mentions, that the town of Almorah is very neat, with a natural pavement of slaty rock, which is kept beautifully clean. He mentions, however, of the peasantry, namely, the Khasyas, that, near Almorah, though they are honest, peaceable, and cheerful, they are dirty to a degree which he never saw amongst the Hindus, and extremely averse to any improvement, using their women ill, and employing them in the most laborious tasks. These people are rigid Hindus. The houses are generally constructed of large masses of stone, roofed with slate, and of two stories in height, the lower story being allotted to cattle. Their poverty is extreme, their food consisting of coarse cakes made from the grain of a kind of holcus, in which the flour, bran, and husk, are mixed together, and baked, or rather scorched, on the fire. In other parts, however, as he advanced farther among the hills, Bishop Heber saw tolerably neat and comfortable cottages, the people better fed and clothed than most of the Khasyas. Polygamy is common among the lower classes.

Wild animals abound in the mountains and forests of this country. The tiger is found, quite up to the glaciers, of size and ferocity undiminished. There are also lynxes, and bears are common and mischievous throughout the province. Though they do not, except when pressed by hunger, eat flesh, preferring roots, berries, and honey, yet, as if out of capricious cruelty, they often worry and destroy passengers. The chamois is not uncommon in the snowy mountains, but scarce elsewhere; and the hares are much finer and larger than those in Hindustan, and not much inferior to those of Europe. The musk-deer is also found in the highest and coldest parts of the province, and the neighbouring countries of Thibet and Tartary. It cannot, says Heber, even bear the heat at Almorah. In like manner, the yak or mountain ox of Tartary droops as soon as it leaves the neighbourhood of the ice. The shawl-goat will live, but its wool degenerates. On the other hand, English dogs, impaired by the climate of the plains, improve in strength, size, and sagacity, amongst the mountains; and it is remarkable that, in a winter or two, they acquire the same fine short shawl-wool, mixed with their own hair, which distinguishes the indigenous animal of the country. The same is in some degree the case with horses. Flying squirrels are also common amongst the colder and higher parts of these woods. Some of the marmots, of the alpine kind, also abound in the neighbourhood of the snow. A singular species of wild dog is mentioned as a native of these hills. In form and fur these animals resemble a fox, but they are much larger. They hunt in packs, give tongue like dogs, and possess a very fine scent. They make great havock of the game amongst the hills, and even attack and destroy the tiger, overpowering him by their numbers. Of birds, the vulture is to be found of a remarkable strength and size. Eagles are numerous, and very large and formidable; and these birds do much injury to the shepherds and goatherds, and sometimes carry away the poor naked children of the peasants. Their nests being in the remote glaciers, and among inaccessible crags, there is no possibility of destroying these dangerous animals. There are larks in Kemaon, not very different from the English, as well as quails, partridges, pheasants, thrushes, &c. A little bird resembling the robin, and the goldfinch, are found at the foot of the snowy mountains.

This country, though, from its elevation, the climate is colder than in Hindustan, with ice and snow in winter, is

remarkably unhealthy, from a certain malaria which prevails in all the lower valleys, especially during and after the rainy season, and which gives rise to ague, intermittents, and fevers, which assume the appearance of typhus, and under which the powers of life decline more rapidly, though often not more surely, than under continued fits of the ague. Several of the inhabitants seen by Bishop Heber in this devoted region, he describes as singularly wretched; the fever and the ague destroying all their energy, and preventing them from adopting the simple means of dry and well-raised dwellings, and sufficient clothing, to support life and health. "They are," says the intelligent traveller already quoted, "a very ugly and miserable race of human beings, with large heads, and particularly prominent ears, flat noses, tumid bellies, slender limbs, and sallow complexions, and have scarcely any garments but a blanket of black wool, though most of them have matchlocks, swords, and shields." The chief region of insalubrity is at the foot of the lowest hills, where a long, black, and level line of forest extends, though the mountainous country is also more or less unhealthy in all the low valleys. The fatal malaria is described as prevailing from the middle of March to the middle of October. "No one," says Mr Hodgson, "can traverse this region without feeling that the pestilence is generated by the undue and almost exclusive prevalence of vegetable exhalations in the atmosphere." There is no free ventilation, and the forest and lesser hills are absolute wildernesses of rank vegetation. Yet it is worthy of remark, that in this pesthouse, from which all mankind flee during eight months of every twelve, constantly reside and are bred some of the mightiest quadrupeds in the world. The tiger, elephant, and rhinoceros abound; and these malarious regions nourish also the *Python bivittatus*, and other huge creatures of this order.

This country was acquired by the British government in 1815, when its limits were extended to the westward by the annexation of a portion of Gurwal, E. of the Alcananda. Prior to this, it was ruled by military chiefs, who owned a nominal allegiance to Nepal, though they were nearly independent within their own territories. They were extremely tyrannical, and not only divided the lands amongst themselves, without regard to the rights of the ancient proprietors, but, on any arrears of rent, sold the wives and children of the peasants as slaves, to an amount almost incredible, whilst they quelled every murmur among the people by the most barbarous severity. The court of Nepal issued repeated edicts against the practice, but without effect, since most of the young persons who were of a marketable age were sold into slavery, when the British, to the great joy of the inhabitants, who gave them every possible aid, acquired possession of the country. Since this period uninterrupted tranquillity has prevailed, which may be partly ascribed to the peaceable and orderly habits of the people, and to the general popularity of the British government. The revenue of the country has been fixed at 154,794 rupees for Kemaon Proper, and at 68,644 rupees for the annexed districts of Gurwal; and, as a proof that the assessment is moderate, it has been punctually realized, and has even been paid in many instances in advance.

The population of Kemaon Proper is estimated at 166,755; that of Gurwal, E. of Alcananda, is yet more considerable. Almorah, the chief town is in Lat. 29. 35., Long. 79. 42.

KEMBLE, JOHN PHILIP, one of the greatest tragedians that England ever produced, was born on the 1st of February 1757, at Prescott, in Lancashire. Mr Roger Kemble, his father, though only the manager of a provincial company of actors, was of ancient and respectable family; and, sensible of the disadvantages attending his own profession, sent his son to receive his education at a Roman Catholic seminary, for the purpose, it is believed, of qualifying him to take orders in the Catholic church.

Kemble.

Kemble.

He was also a student for two or three years at the College of Douay; but the strength of natural bias prevailed, and he became an actor in 1776. After performing in York, Liverpool, Manchester, Edinburgh, Dublin, and other places, and gradually acquiring reputation, he made his first appearance before a London audience on the 30th of September 1783, in the character of Hamlet. He was received by the public generally with great applause, although, as always happens in such cases, a party lagged behind, preferring and paying greater homage to a favourite idol of longer standing. He rapidly attained an acknowledged pre-eminence in the tragic scene, and took that decided lead which he ever afterwards maintained. In 1790 he became manager of Drury Lane Theatre, which he conducted, with only a slight interruption, till 1801; and during that period he did much to reform the morals and raise the character of the stage. In 1794, he brought out a musical piece of his own, entitled *Lodoiska*, which was very successful at the time, and is still occasionally performed. He likewise revived old pieces of merit, and brought forward many new productions, some of which were of considerable merit, altered by himself. In 1802 he visited the Continent; and, on his return to London, purchased for £24,000 a sixth share of Covent Garden Theatre, and became manager of that establishment. His career in this place was brilliantly successful, but partially suspended in consequence of the total destruction of the theatre by fire in 1809. A new edifice, however, was speedily reared, and opened with an increase of entrance-money, which, along with certain arrangements regarding the private boxes, created a series of disturbances, known by the name of O. P. riots. These lasted for sixty-six nights, and only ceased when the public carried their point. Kemble stood the storm with firmness; but during the whole of that period he never showed himself on the stage without being grossly insulted. In 1812 he retired for two years, conceiving he had done his part, and being desirous of repose. His return to the stage was hailed with the utmost enthusiasm. He rose to the summit of popularity, and was acknowledged, without dispute, as the first actor in Britain, probably in the world. His health, however, began to give way; and he formed the resolution of taking farewell of the stage, which he did on the 23d of July 1817, after performing, with unabated power, his great character of Coriolanus. The "Valedictory Stanzas" addressed to him at a public meeting held in that month, do equal honour to the actor, and the poet Mr Campbell; and Sir Walter Scott composed the "Farewell Address" which he delivered on taking leave of the Edinburgh stage in the month of March preceding. He retired to the Continent, and fixed his residence at Lausanne, where he died on the 26th of February 1823.

In judging of the talents of Kemble, we must regard him in the threefold character of actor, manager, and stage-reformer. In reference to the first, tragedy,—and that of the most stately and majestic character,—was the line in which he excelled. His person was on a scale suited to the stage, being tall and stately; his countenance, in nobleness of expression, resembled the finest models of the antique; and his movements and demeanour, at once majestic and graceful, corresponded to the heroic cast of his form and features. The grand characters of republican Rome,—Coriolanus, Cato, Brutus,—were those to which he was led, both by nature and by choice; but he was no less powerfully effective in Macbeth, King John, Wolsey, Lear, Hamlet, Jacques, and Penruddock. The memory of his triumphs in these and many other parts is still fresh in the hearts of thousands, among whom it is not an uncommon remark, that another Shakspeare may appear, sooner than another Kemble. The personal character and influence of Kemble consummated the work of stage-reform which Garrick had begun. Austerely correct in his own morals, he enforced

the same high standard on all connected with the theatres which he managed. A student and a scholar, he was a welcome guest at the tables of the highest persons in the land; and his success in social as well as professional life gave a character to the British stage such as it never enjoyed before or since his day. He turned his learning to account in reproducing the exact costumes and manners of the age to which every piece belonged, and correcting the ridiculous anachronisms which had crept upon the stage. His taste was shown in the correctness and splendour of the scenic decorations, on which he bestowed much care and expense. His life, by his friend Boaden, 2 vols. 8vo, 1825, is a well-meant, though very inadequate monument of his fame.

KEMPIS, THOMAS A', the reputed author of the *De Imitatione Christi*, was born about the year 1380 at Kempen, near Cologne. His family name was Hämmerchen or Hämmerlein (in Latin, *Malleolus*), but he always called himself from his birth-place. Destined from an early age for the church, he was sent to receive the necessary training in a school at Deventer, belonging to the Brethren of the Common Life (*gemeines Lebens*). In his twenty-second year he joined the monks in the convent of St Agnes, near Zwoll, of which his brother, John à Kempis, was prior. After a novitiate of six years, he took the monastic vows, and remained a canon in the convent for the long period of sixty-five years. He died in 1471, at the advanced age of ninety-two. The greater part of his life seems to have been spent in transcribing books of devotion. One Bible in four folio volumes is mentioned which cost him fifteen years to copy and illuminate. His transcript of the famous essay on the *Imitation of Christ* has given rise to a controversy as to the authorship of that work, which has been keenly maintained, and is still as far from being decided as ever. Besides A' Kempis, two other candidates have been brought into the field, whose claims have been warmly advocated by their respective partizans. These are Jean Gerson, chancellor of the University of Paris, and Jean Gersen, whose supporters describe him as abbot of a monastery at Vercelli in the thirteenth century, while his opponents deny his existence altogether, and pronounce his name to be a corruption of Gerson's. The authorities for each opinion are pretty equally balanced. German and Flemish writers, countenanced by the Sorbonne, contend stoutly for A' Kempis; the French are equally zealous for their distinguished countryman; while the claims of Gersen are upheld by the most learned of the Benedictines. In favour of A' Kempis has been urged the testimony of many editions bearing his name, one of which is dated 1471, besides the wide-spread and generally accepted tradition which has ascribed the work to him ever since his own time. Against him, on the other hand, it is urged that he was merely a calligrapher or copyist; that the *Chronicle of St Agnes*, a contemporary work, makes no mention of his having written the *Imitation*, and that its name is not found in an early list of the works attributed to him. In support of Gerson are brought forward a great number of French and Italian editions, belonging to the fifteenth and sixteenth centuries, one of which bears date of Venice 1483. Gersen's claims are based on a very ancient MS., which ascribes the authorship to him directly, while he has the benefit of all the manuscripts held to be older than the times of Gerson and A' Kempis. The internal evidence furnished by the book itself is equally conflicting. On the one hand, the Gallicisms are very numerous, and such as could hardly have occurred to any one whose native tongue was not French. On the other hand, the whole spirit that breathes throughout the work is that of a solitary ascetic, who places the rule of life in absolute seclusion from the world, and seldom refers to the exercise of any social or domestic duty. As the first of these testimonies decidedly strengthens the case of Gerson, the second

Thomas à Kempis.

Kempton
||
Ken.

is equally conclusive against him, for the greater part of his life was spent in active duty as Chancellor of the University of Paris, and head of the Gallican church. Of late years, however, his claims have been very keenly pressed by the French critics, among whom Gence and Daunou are conspicuous; the former in various articles in the *Biographie Universelle*, and the latter in the *Journal des Savans* for 1826-1827. It may be doubted, however, if the controversy either will or can ever be settled. The work itself, which has been the subject of so much debate, has been often translated into the various European tongues, though it may be doubted if any of the versions can vie in expression with the concise and energetic, though somewhat barbarous Latin, original. It is calculated that it has now gone through 1800 editions, and that it has been more read than any other book except the Bible. With a deep knowledge of human nature and of the world, it breathes a spirit of the most refined and lofty devotion, while many isolated sentences are memorable for their beauty and heart-piercing truth. (See Hallam's *Liter. of Europe*; *Biog. Univers.*; Barbier's *Dissertation*; Napione's *Dissertation*; Ullmann's *Reformers*, &c.; Ersch u. Gruber's *Encyclopædie*, &c.)

KEMPTEN (*Campodunum*), a town of Bavaria, circle of Suabia, is situated on the Iller, 50 miles S. of Augsburg. It consists of an old and new town; the former in the valley, walled and inhabited by tradespeople, the latter, called the Stifts-stadt, on the height, formerly the seat of an abbot, who was lord of the town and surrounding territory. Its chief manufactures are linen, cotton, and woollen stuffs. On the neighbouring eminence of Hilarment are the ruins of a fortress supposed to be Roman. Pop. about 8000.

KEN, THOMAS, bishop of Bath and Wells, was born at Berkhamstead, in Hertfordshire, in July 1637. From Winchester School, to which he was sent at the age of thirteen, he went to New College, Oxford, and there became a probationer-fellow at the age of twenty. In 1666 he was chosen fellow of Winchester College, and afterwards became successively domestic chaplain to Bishop Morley, rector of Brixton, in the Isle of Wight, and in 1669, prebend of Westminster. In 1674 he started with his nephew, Isaac Walton, upon a tour to Rome, and, upon his return, after five years of absence, took his degrees in divinity. Having been appointed chaplain to the Princess of Orange, he went to Holland, and on his return to England, was appointed chaplain to Lord Dartmouth, in the expedition to Tangier. In 1684 he became chaplain to Charles II., whom he closely attended during his last illness, speaking to him, according to Burnet, "with great elevation of thought and expression, and like a man inspired." Charles, shortly before his death, had nominated Ken to the bishopric of Bath and Wells, and after some delay he was fully invested in his episcopal functions after the accession of James II. In 1685 appeared his *Exposition of the Church Catechism*, and *Prayers for the Use of the Bath*. Zealous in his attachment to the Church of England, he did not shrink from pointing out, even in the chapel-royal, the danger of a coalition with the sectaries. On the other hand, he was no friend to Popery, for the attempts made by the court to gain him over were unsuccessful; and when the king, having assumed the dispensing power, ordered the declaration of indulgence to be read, Ken openly opposed it, and, along with six others, was sent to the Tower. Still he considered James his lawful sovereign, and after the Revolution, when the Prince of Orange ascended the throne as William III., he would not transfer his allegiance to the new monarch. In consequence of this refusal he was deprived, and retired to Longleat, in Wiltshire, where he died on the 19th March 1711 at the age of seventy-four. A small pension settled on him by Queen Mary was his chief means of sup-

Kendal
||
Kenilworth.

port during his latter years. A collective edition of his works, consisting of sermons, charges, and poems, was published in 1721, in 4 vols. 8vo. His prose works, and much of his poetry, have passed into oblivion; but his hymns, which breathe a spirit of lofty and resigned devotion, have fixed themselves in the hearts and memories of the English people, and will never be forgotten.

Intellectually and morally, Ken stood highest among the nonjuring prelates. He was a man of solid and extensive learning, refined taste, and wide sympathies. While in office, he laboured with an apostolic zeal and self-devotion. His high sense of duty was shown in the readiness with which he relinquished wealth and station, and retired into obscurity and poverty, rather than forego his principles. The tenderness and humanity of his nature were strikingly displayed in his kindness to the victims of the Monmouth rebellion,—many of them personal, and all of them political enemies,—whom he helped from his private resources with no sparing hand.

KENDAL, KIRKBY-KENDAL, or KIRKBY-IN-KENDAL (the Kirk-Town of Ken Dale), market-town and parliamentary borough, county of Westmoreland, is situated in a pleasant valley, on the E. bank of the Ken or Kent, 50 miles S. of Carlisle. The general appearance of the place is agreeable—a long line of white walls and blue-slate roofs, rows of poplars, neat stone bridges, background of hills, and in the distance, up the valley, the high summits that overlook Kentmere. Its position is probably the main cause of its being one of the most rainy places in England. On a steep eminence to the E. are the ruins of the castle of the Kendal barons, of which only four broken towers, and the outer wall surrounded by a deep fosse, remain. It was here that Queen Catherine Parr was born, and her remains are interred in the parish church. Facing Kendal Castle on the W. is the Castle-How, or Castle-Law-Hill, an ancient mound encircled by a ditch and rampart, and surmounted by an obelisk of modern erection in commemoration of the Revolution of 1688. Kendal has been noted for its woollen manufactures since the fourteenth century, when a colony of Flemish weavers settled here by the invitation of Edward III. The manufacture of green cloth seems to have acquired considerable reputation before Shakspeare's time, who speaks of

"Three misbegotten knaves in Kendal green."

To the branches of industry connected with these manufactures, several others are now added, as marble cutting, currying, &c. The town is respectably supplied with educational and literary institutions, and publishes two weekly newspapers. By the Reform Act, which disfranchised Appleby, Kendal returns one M.P. Dr Thomas Shaw, the celebrated traveller, was born here in 1693. Pop. 11,829.

KENEH, or GIENEH (*Cænopolis*), a town of Upper Egypt, on the N. bank of the Nile, nearly opposite the ruins of Denderah. It is the principal entrepôt of the Arabian trade by way of Cosseir, and is one of the stations for the great pilgrim caravan from West and Central Africa. Passengers to and from India sometimes travel by the Nile, passing through Keneh instead of going by Suez. The place is celebrated for its manufacture of porous water-jars, &c., which are floated down the Nile in rafts.

KENILWORTH, a small town of Warwickshire, nearly equidistant (5 miles) from Warwick, Leamington, and Coventry. The only interest of the place centres in its ruined castle, which stands on a rocky and commanding eminence. This castle, formerly one of the most extensive and majestic baronial edifices in England, was founded by Geoffrey de Clinton, Lord Chamberlain and Treasurer to Henry I. It was granted by Henry III. to Simon de Montfort Earl of Leicester, and became the chief rallying-

Kenmare
||
Kennet.

point of the insurgents who sided with that noble. After his death, it held out for six months against the royal forces. It was the scene of a splendid tournament in the time of Edward I., and here his successor was confined before his removal to Berkeley Castle. In the reign of Edward III. it passed into the hands of John of Gaunt, who made large additions to it. Under his son Henry IV. it reverted to the crown, and so continued till it was conferred by Queen Elizabeth on her favourite Leicester, who expended immense sums in enlarging and adorning the building. Elizabeth visited Kenilworth three times, and on the occasion of her last visit (1575), was entertained in a style of unparalleled magnificence. (See Sir Walter Scott's *Kenilworth*.) After Leicester's death, the castle was seized by the crown. It was dismantled in the time of Cromwell, and thenceforth abandoned to decay. Since the Restoration it has belonged to the house of Clarendon. The only remnant of the original fortress is the Keep, "Cæsar's Tower," the walls of which are in some places 16 feet thick. The more modern portions have suffered most from the ravages of time.

KENMARE, a market-town of Ireland, county of Kerry, Munster, at the head of Kenmare Bay, 15 miles S.S.W. of Killarney. The town is neatly built, having one wide street, from which several smaller ones diverge. It has a large Roman Catholic chapel, handsome parish church, newsroom, bridewell, and workhouse. The bay is crossed by an elegant suspension bridge, and a little below the town is a pier affording sufficient depth of water for vessels of large burden. Chief exports, corn and salmon. Pop. (1851) 1501.

KENMORE, a parish and village of Perthshire, in the district of Breadalbane, embracing some of the finest scenery in Scotland. See PERTHSHIRE, and TAY.

KENNET, an English river, rising in the Wiltshire Downs, flowing through Wiltshire and Berks eastward, by Avebury, Marlborough, Hungerford, Newbury (where it becomes navigable), and Reading, below which it joins the Thames, after a course of about 50 miles. The vale of Kennet, from Newbury to Reading, is one of the most fertile districts in England. The Kennet is celebrated for its trout, and its eels are commemorated by Pope:—

"The Kennet swift, for silver eels renowned."

KENNET, WHITE, bishop of Peterborough, a learned antiquarian, historian, and theological writer, was born at Dover in 1660. Educated at Westminster School, and afterwards at Oxford, he became at an early age rector of Amersden, with a prebend in the church of Peterborough. In 1691 he returned to Oxford as tutor and vice-principal of Edmund Hall, where, among other pupils, he numbered the famous antiquary Hearne. In 1700 he resigned Amersden, and removed to London, where he was presented with the living of St Botolph, Aldgate. In the following year he was made Archdeacon of Huntingdon; and at a later period, Dean of Peterborough. In 1718 he received, as his last preferment, the bishopric of Peterborough, which he retained till his death in 1728. Two years after his death a detailed biography of him was published by the Rev. W. Newton, rector of Wingham in Kent.

According to his biographer's account, Kennet was a man of great mental activity, "of incredible diligence and application, not only in his youth, but to the very last." Besides his published works, which amply confirm this testimony, his autograph MSS., now preserved in the British Museum, furnish decisive proof. In the religious controversies of the day he took a keen and active part; indeed, his biographer admits that his party zeal was carried to excess. Identifying himself with the Low Church party, he opposed the Sacheverell movement with all his might, and afterwards, when the Bangorian controversy broke out, he being at that time dean of Peterborough, fought with so much ar-

dour on Hoadley's side, that he believed his chances of church preferment to be totally ruined. His zeal in these and other disputes, sharpened by a strong temper and strong passions, raised many bitter enemies against him, by whom he was sometimes very roughly handled. A colour was given to the outcry against him, from his having been thought in early life to have had High Church leanings. His funeral sermon on the first Duke of Devonshire, in which he was charged with having sacrificed some of the fundamental points of religion to his own ambition, was also brought up against him; but he was too useful and too able a controversialist to be given up by his party.

Kennet's principal works are his *Parochial Antiquities attempted in the History of Ambrosden, Burcester, and other adjacent parishes in the counties of Oxford and Bucks*, 1695, 4to. In 1706 appeared a *Compleat History of England*, 3 vols. fol. The third of these, bringing down the narrative from Charles I. to Queen Anne, was written by Kennet. In 1698 he had published an edition of Sir Henry Spelman's *History and Fate of Sacrilege*, which six years later he followed up with his own *Case of Impropriation, and of the Augmentation of Vicarages, &c.*, a department of church administration which he had much at heart. His other works were for the most part occasional sermons, and controversial pamphlets. The value of most of these fell with the occasion which called them forth, and they are now interesting only to the antiquary.

KENNICOTT, BENJAMIN, an eminent Hebrew scholar, was born at Totness in Devonshire in 1718. At an early age he was appointed to succeed his father as teacher of a charity school in his native town. His precocious talents and learning interested some rich friends in his behalf, and by their kindness he was provided with the means of studying at Oxford. Entering himself of Wadham College in 1744, he soon distinguished himself in Hebrew and Divinity; and, while still an undergraduate, published two essays, *On the Tree of Life*, and *The Oblations of Cain and Abel*. These popular treatises came to a second edition in 1747, and procured for their author the degree of B.A. free of expense, and also a year before the usual time. He was soon afterwards chosen fellow of Exeter College, and in 1750 took the degree of M.A. Continuing to pursue his studies peacefully at Oxford, he was, in 1767, made keeper of the Radcliffe Library, and, a few years later, rector of Mynhenyote in Cornwall. This, though a very valuable living, he subsequently resigned, finding himself without time to do duty in person, and having scruples of conscience against doing it by deputy. In 1770 he was made prebend of Westminster; a preferment which he soon exchanged for a canonry in Christ Church, Oxford. He died in 1783, after a lingering illness, at the age of 65.

Kennicott's great work is his edition of the *Hebrew Bible*. To prepare the way, he published in 1753 an essay *On the printed Hebrew Text of the Old Testament*, the object of which was to overthrow the opinion at that time received by many eminent divines, and at one time held by Kennicott himself, that the Hebrew text was absolutely correct, that it agreed with the MSS., and, as a consequence, that the MSS. agreed with each other except in very trifling cases. In some religious communities a belief in the Divine authority of what is known as the Masoretic text was required as an article of faith from those entering the ministry. The question was obviously to be decided by an appeal to the Hebrew MSS. themselves, and in this important work Kennicott led the way in those laborious researches which have resulted in the collation of many hundreds of Hebrew MSS. Kennicott undertook to show that the MSS. which had been supposed to agree with each other, and with the printed text, contained numerous and various readings, which tended to support the authority of the ancient versions; and he announced the existence of six Samaritan

Kent.

MSS. of the Pentateuch in the libraries of Oxford, from which not only the printed Samaritan, but even the Hebrew text might be corrected. It was to be expected, from what we have already said of the state of feeling on the subject of the integrity of the Hebrew text, that the position assumed by Kennicott would be strenuously attacked, and we find the names of Rutherford, Warburton, and Bishop Horne, among his assailants. Nevertheless, by many eminent and learned men in his own country, as well as abroad, he was considered to have established his point. In 1760, seven years after his First, appeared his Second Dissertation on the state of the printed Hebrew text. In this treatise he defended the Samaritan version of the Pentateuch, and showed that the Chaldee paraphrase had been wilfully corrupted; he gave a history of the Hebrew text from the time at which the canon of the Old Testament was completed to the invention of printing; and produced a catalogue of 110 Hebrew MSS. in the British Museum, Oxford, and Cambridge, as well as a collection of 11 Samaritan MSS. Considerable interest had by this time been excited regarding these MSS., and a desire was extensively felt by divines, and the learned generally, to have the subject fully investigated. Accordingly, Dr Kennicott published a proposal that subscriptions should be raised to defray the expenses of a complete collation of all accessible MSS. at home and abroad. The list of subscribers was headed by King George III., and in a short time nearly L.10,000 were raised—an unprecedented amount for a literary purpose. For nine years the work of collation was actively conducted by eminent men employed for the purpose, Kennicott himself examining the MSS. of Great Britain and France, while Professor Bruns examined those of Germany, Switzerland, and Italy. Sixteen Samaritan, and upward of six hundred Hebrew MSS. were either wholly or in part collated between 1760 and 1769, an annual statement being furnished by Kennicott regarding the progress of the work. Several years more elapsed before all the materials were properly arranged, and, when ready for press, they extended to 30 vols. folio.

His great work bears the title *Vetus Testamentum Hebraicum, cum variis Lectionibus, Edidit Benjaminus Kennicott, S.T.P., Oxoniæ, 1776-1780, 2 vols. folio.* The text followed was that of Van der Hooght, with which the MSS. had been collated; the points, however, were omitted. *The Dissertatio Generalis*, prefixed to the second volume, contained a history of the Hebrew text from the time of the return from Babylon to the invention of printing, along with an account of the Rabbinical works and MSS. which he had consulted. The poetical books were printed according to the metrical laws of parallelism as established by Lowth. The various readings were printed at the foot of the page with references connecting them with the texts from which they differ, while the Samaritan variations were placed in a column parallel with the Hebrew itself.

To this work of Kennicott, a valuable supplement was published by De Rossi at Parma, 1784-87, 4 vols. 4to.; but a more commodious work, containing a selection of the more important various readings collected by Kennicott, De Rossi, and others, was published by Doederlein and Meissner at Leipsic, 1793, 8vo. A more correct edition, on the same plan, was published by Jahn at Vienna, 1806, 4 vols. 8vo. This again has been followed by the editions of Boothroyd, Judah d'Allemant, and others.

A full account of Kennicott's edition of the Hebrew Bible is given in the *Monthly Review* (O. S.), vols. lv., lxiv., lxv., and in Marsh's *Divinity Lectures*, part ii.

KENT, a maritime county in the N.E. of England, bounded on the N. by the estuary of the Thames, on the E. and S. by the English Channel, on the S.W. by the county of Sussex, and on the W. by the county of Surrey. The name is supposed to be Celtic, signifying a corner or projection (as the same word in Cantyre evidently denotes);

Kent.

and this name aptly describes the position occupied by Kent on the map of England. The extreme length of the county is, from Deptford to the North Foreland, W. and E., 63 miles; and the extreme breadth, from the North Foreland to Dungeness, N. and S., 40 miles.

The geological character of the county exhibits five parallel belts, occupied by different formations, and running E. and W. The first belt consists of the soil extending from the estuary of the Thames to the foot of a range of hills called the North Downs, and is occupied by the London and plastic clays; but with this variation, that, while the plastic clay overlies the chalk for the most part, the London clay overlies the plastic clay in the Isles of Sheppey and Grain, and in a large district extending from the sea-shore at Reculver and Whitstable S. to Canterbury. The second belt consists of the North Downs, a range of chalk hills which enters the county from Surrey, near Westerham, and extends to the coast near Folkestone. The range varies in breadth from 3 to 6 miles; and its greatest elevation, Haltingbourne Station, is 616 feet above the level of the sea. The third belt consists of a tract of chalk, marl, and greensand, cropping out of the North Downs, and varying in breadth from 2 to 7 miles. The marl and greensand lie in strips, the latter being the widest, and the southern slope of the belt forms what are called the "Ragstone Hills," overlooking the valleys of the Bealt, the Eden, and the Medway. The fourth belt consists of the Weald clay, and extends throughout the county from the borders of Surrey to Romney Marsh, with an average breadth of 5 miles; the clay is sometimes intermixed with thin beds of sand. The fifth belt consists of a range of hills occupying the remainder of the county and bordering on Sussex, amongst which the Medway and other rivers rise; it is occupied by iron sand. It will be seen, then, that the county presents two valleys, known as the Homesdale and the Weald, and three ranges of hills, succeeding each other from the banks of the Thames to the border of Sussex. Singularly enough, however, most of the rivers, though they rise in the southernmost part of the county, instead of finding outlets into the English Channel to the E., traverse the county, cutting the ranges of hills, and fall into the Thames on the N. This imparts a broken and irregular appearance to the surface. Dr Lyell, in describing the Weald, has given a graphic picture of the central portion of the county. "I shall suppose," he writes, "the reader first to travel southwards from the London basin. On leaving the tertiary strata he will first ascend a gently inclined plane, composed of the upper flinty portion of the chalk, and then find himself on the summit of a declivity, consisting for the most part of different members of the chalk formation; below which the upper greensand, and sometimes also the gault, crop out. This steep declivity is called by geologists 'the escarpment of the chalk,' which overhangs a valley excavated chiefly out of the argillaceous or marly bed termed gault. The escarpment is continuous along the southern termination of the North Downs, and the reader may trace it from the sea at Folkestone westward to Guildford and the neighbourhood of Petersfield, and from thence to the termination of the South Downs at Beachy Head. In this precipice or steep slope the strata are cut off abruptly, and it is evident that they must originally have extended farther. . . . The geologist cannot fail to recognise in this view the exact likeness of a sea cliff; and if he turns and looks in an opposite direction, or eastward, towards Beachy Head, he will see the same line of heights prolonged. Even those who are not accustomed to speculate on the former changes which the surface has undergone, may fancy the broad and level plain to resemble the flat sands which were laid dry by the receding tide, and the different masses of chalk to be the headlands of a coast which separated the different bays from each other."

Kent.

The rivers of the county are—the Medway, the Stour, the Darent, the Cray, the Ravensbourne, and some minor streams. The Medway is a noble stream; its trunk and branches cover 30 square miles of the surface of the county, and its length is nearly 60, of which 40 are navigable. The river well deserves the name of “Vaga,” by which the Britons described its wanderings; the Saxons added the syllable *med*, the sign of middle, because the river runs through the centre of the county, and thus it gets its present name of Medway. The river has four heads—one rising in Surrey, in the parish of Bletchingley; two in Sussex, at Waterdown Forest; and one in Kent, at Goldswold in Great Chart. The highest branch, which enters the county from Surrey, flows by Eaton Bridge and Hever Castle, and being constantly swelled by the brooks which drain the higher part of the weald of Sussex, it becomes navigable on reaching Penhurst. Here it separates into two branches for a mile, and is joined by the Eden, one of its main branches, which rises above Godstone in Surrey, and receives the drainage of the valley that separates the green-sand hills from the central iron-sand high lands in the Weald. From Penhurst the stream rolls on to Tunbridge, separating into five channels above that town, and reuniting into one just below it. From thence proceeding to Twyford Bridge, it receives the waters of two of its sources,—one rising in Sussex, the other in Kent,—and rolls on to Yalding in the Weald, where it is joined by the Teyse and the Bealt; and from thence to Maidstone, where, by means of a lock, erected in the reign of George II., at Allington below that town, the river has been rendered navigable as high as Penhurst. From Allington, where the river meets the tide, it flows on with many a mazy fold, and amidst magnificent scenery, to Rochester, becoming there a noble tidal river. A fine stone bridge of six arches crosses it at this city. The Medway next reaches Chatham, where a fleet of war ships “repose on their own shadows” in its land-locked waters, awaiting the time of action. The stream now widens its surface, and its rapidity frets the land into several islands, of which the island of Sheppey is the largest; and while one part of its waters escape into the open sea through the Swale channel, the main stream enters the Thames at Sheerness, the seat of a second naval arsenal. The Stour, a name supposed to be derived from “Es Dwr,” the water, has two branches, known as the Greater and Lesser Stour. The Greater Stour has two sources, which flow from opposite directions; one from Lenham in the N.W., the other from near Hythe in the S.E., and after each has flowed ten miles, they unite at Ashford, and proceed to Canterbury, where the stream becomes navigable. Farther on at Starre, the river separates into two branches, one of which falls into the estuary of the Thames near Reculver, and the other into the English Channel at Pegwell Bay. Thanet being situated between the arms of the Greater Stour, is therefore an island, and in former times was insulated from the rest of Kent. A thousand years ago the arms of the Stour formed a channel 3 or 4 miles wide, which was called the Wantsume, and shipping used it as late as the reign of Henry VIII., to avoid the delay and danger of doubling the North Foreland. The channel has, however, gradually filled up with silt; and the mischief was completed by erecting flood-gates to irrigate the adjoining land with its waters. The Lesser Stour rises at Liminge near Hythe, flows along the edge of Barham Downs, and, after running parallel with the Greater Stour, falls into that arm of it which joins the sea at Pegwell Bay. The Darent rises at Westerham on the border of Sussex, flows by Shoreham, Farningham, and South Darent, and from thence to Dartford, where it becomes navigable for small craft, and falls into the Thames at Long Reach. The River Cray rises at Oppington, flows by several villages which take their names from it, and falls into the Darent at Dartford Creek. The

VOL. XIII.

Kent.

Ravensbourne rises on Keston Downs, flows between Hayes and Bromley, by Lewisham to Lee, where it is joined by the Leeburne, becomes navigable at Deptford Creek, and there falls into the Thames. The Rother rises in Sussex, to which county it properly belongs, though it is one of the streams which insulate Oxney Isle, forming the continuation of Romney Marsh; it is navigable in all that part of its course which touches Kent. Finally the great Thames may be considered one of the rivers of Kent, as it forms the northern boundary of the county, and empties itself into the sea on its coast.

The coast line of the county may be described as commencing at Gravesend, where the River Thames widens into an estuary. From thence to the channel of the Swale, it is broken into the islands of Graine, Sheppey, Elmley, and Harty, which are marshes insulated by the arms and creeks of the Thames and Medway. Graine is so low, that it is necessary to defend the soil by strong embankments, but the sea face of Sheppey is formed by chalk cliffs from 80 to 90 feet high. Cliffs of sand and clay succeed from the east bank of the Swale to the western limit of the Isle of Thanet, and here the chalk cliffs recommence, and extend to the North Foreland, the eastern extremity of the county, and from thence S. to Pegwell Bay, where one arm of the Stour forms the limit of the Isle of Thanet in that direction. The coast line sinks from Pegwell Bay to Walmer near Deal; and here commence the tall white cliffs of chalk from which England has obtained its name of Albion. These extend round the South Foreland to Sandgate, and from thence the coast-line falls to the level of Romney Marsh, a great part of which is below the level of the sea, and is protected from overflow by a massive embankment called Dymchurch Wall. The coast from the Isle of Sheppey to the North Foreland is skirted by sands and flats, which prevent ships of any size from approaching it. On the eastern coast, at from 3 to 7 miles from the shore, lie the Goodwin Sands, which, while they are a dangerous obstacle to the navigation of the Straits of Dover, serve as a breakwater to the roadstead of the Downs, which is indeed created by them. This anchorage is about 8 miles long and 6 wide; it is sheltered from the E., W., N.W., and partially from the N., and is a celebrated rendezvous for ships outward and homeward bound. The sea is gradually eating away the coast line of Kent, with the exception of that part formed by Romney Marsh, which has been recovered from the sea. Fifty acres of land on the cliffs of the island of Sheppey have disappeared within twenty years, and it is calculated that the whole of the island will be lost in a century. Nearly 100 yards of land have been lost at Reculver since 1780, part of the churchyard has been swallowed up, and the church, now abandoned, would also have been washed away, if a breakwater had not been constructed to deprive the waves of their force. Bedlam Farm, in the Isle of Thanet, is gradually diminishing in extent, and the far-famed Shakspeare's cliff at Dover is losing its height, the slope being towards the land. The cliffs are, in short, disappearing at the rate of from 2 to 3 feet every year. The Goodwin Sands, according to tradition, were a part of Kent, which was overwhelmed by the sea in 1097, when it belonged to the estate of Goodwin, Earl of Kent, a famous chieftain of his time. This is supported by the fact, that a bed of blue clay underlies the sand at a depth of 15 feet; but, on the other hand, many geologists and antiquarians incline to the opinion that, instead of land having been converted into sea, these sands were laid bare by a terrible inundation in the reign of William Rufus, when the drowning of Flanders and the low countries on the opposite side of the Channel, lowered the level of the sea in the narrow strait separating England from the Continent. It is a familiar expression, “Tenterden steeple is the cause of Goodwin Sands;” and, though

Kent. it is generally used to ridicule false reasoning, nevertheless, according to tradition, it is the truth. Time out of mind, we are told, money was collected throughout the county to maintain the banks of the land against the sea; but no damage having been done for many years, the Bishop of Rochester, in whose hands the money had been placed, spent it in building Tenterten steeple. A storm arose afterwards and swallowed up the land; and thus, though the old man who said, "The Goodwin Sands were firm land before Tenterten steeple had been built," was laughed at in his own time, and has furnished reasoners with a sarcasm for eight centuries, he was right after all. Geologists generally agree in the opinion that England was originally a part of the continent of Europe, the British Isles being fragments broken off by an irruption of the sea, similar to that which, in the thirteenth century, separated Friesland from Holland. De la Beche, however, contends that the separation was not caused by a violent movement, but by the gradual action of the sea. Certain it is, that the opposite cliffs of Kent and France are of chalk, having a remarkable resemblance in their contour, and that a chain of rock extends, at a depth of 14 feet below the low water line, from Folkestone to Boulogne.

There is not a single good harbour, at least one that ships can enter at all times of the tide, along the whole coast of Kent. The harbours usually consist of piers projecting from the land, and are dry at low water. The Strait of Dover, however, is the great artery of our foreign commerce, and Kent is the water-gate of England; to provide, then, for the safety of navigation and the great stream of passengers constantly pouring between England and the Continent, artificial harbours have been formed at Folkestone and Dover.

The climate of Kent is, on the whole, mild, pleasant, and healthy. Lambarde, a writer of the sixteenth century, quaintly tells us, indeed, "The air is bad in winter, worse in summer, and at no time good; fit only for those vast herds of cattle which feed all over it." Though this may have been true in the days of the writer, it is untrue in our own. Now that cattle are no longer free denizens of the soil, that the ground is cultivated, that marshes have been drained, and that the laws of health are known, the climate is mild and genial. The N.E. winds, too, sweeping over the Continent, absorb the superabundant moisture of the low grounds. Cranbrook, it has been demonstrated, is one of the healthiest places in the kingdom; and medical experience, and longevity amongst the inhabitants, testify almost as highly of the whole county. The coast is dotted with towns, the population of which is made up of persons seeking, and, as we may suppose, finding health there. The mineral waters of Tunbridge, on the western side of the county, have long been celebrated for their health-giving properties; and, though the influence of fashion has created many rivals, it is still the resort of a large number of invalids and pleasure-seekers.

The soil of the county, to speak generally, consists of clay, chalk, and gravel, which, when mixed, produce an exceedingly fine loam. Clay predominates; indeed, the county belongs geologically to the great clay basin of which London is the centre. No part of the kingdom, however, exhibits within such a limited compass so great a variety of soils, and, in consequence, so many modes of cultivation and production.

For the purpose of agricultural description, Kent may be divided into eight districts. The first of these is the Isle of Thanet, in the N.W. angle of the county, containing 23,000 acres of arable land, and 3500 of pasture. The soil is a light mould, on a chalky bottom, highly enriched by seaweed and other manure obtained from the shores, and there is scarcely an acre of waste in the district. The produce consists of wheat and beans, which are grown with-

out fallow or intermission, and of canary, mustard, spinach, and other seeds; and in order to preserve the latter from birds, trees and hedgerows are not suffered to exist. The second district comprises the sheep downs and upland farms which surround Canterbury, extending to Dover on one side, and Ashford and Rochester on the other. The soils here are very dissimilar; some being heavy loamy clay, with flint stones on the surface, others being stiffer, while the whole rests on a subsoil of chalk. All kinds of grain are grown, and the harvest is usually a fortnight later than in the Isle of Thanet. The third district comprises a rich sandy loam, in the neighbourhood of Sandwich, Faversham, and Deal, producing, in addition to the ordinary crops, a large quantity of apples. The fourth district extends from Maidstone to Sandwich, including Canterbury, and may be called the garden of Kent. In this district hops, apples, and cherries are the chief produce. The soils on which the hops are grown differ materially; one, locally called stone-shalten, is mixed with many small portions of sand and stone, and rests upon the Kentish ragstone, which is burned into excellent lime; others, and these are the most productive, have a deep loam surface, with a subsoil of deep loamy brick earth, and are mixed with a large number of flint stones. The fifth district is the Isle of Sheppey, 11 miles long and 8 broad, and separated from the rest of the county by the Swale, a navigable arm of the sea. Four-fifths of this district are either marsh or dry pasture land; the arable land, of which there are about 10,000 acres, is highly productive, especially of wheat. The soil is a heavy clay, enriched with the cockle-shells found on the beach, and as many as thirty cart-loads have been applied to the acre. The sixth district is formed by the uplands of West Kent, a ridge of chalk hills, locally called the "Hog's Back," about 6 or 7 miles broad; the soils are various, but chiefly a stiff clay, with many surface flints. A large number of flocks of sheep are grazed in this district, and much timber is grown. The seventh district is the Weald, the ancient forest of the county. The soil is principally clay, with a substratum of marl, varying in stiffness. It produces wheat, oats, barley, rye-grass, clover, and beans, and a large number of cattle are fed. The eighth division is the rich, level, and extensive expanse of Romney Marsh, on the southern coast. The whole is alluvial land, consisting of a fine rich soft loam, with portions of sea sand and broken shells intermixed. The subsoil consists of alternate layers of sand and clay, mixed with shells, amongst which are sometimes found large oak trees, in various positions, and as black and hard as ebony. The breeding and fattening of sheep form the principal pursuit in this level, and the number bred is greater perhaps than in any other district of similar extent in the kingdom. The farmer has usually two kinds of land, one for breeding, the other for fattening cattle. The Romney Marsh sheep have become celebrated for the excellence of their mutton, the length of their wool, and its fineness of fibre.

The practice of agriculture in Kent is peculiar to the county. While the farmers of England generally devote their attention to two or three main crops, those of Kent remain faithful to the special productions for which the county has become famous. Kent grows half the hops produced throughout the entire country,—the "wicked weed," as it was called when introduced in the time of Henry VI.,—and they are superior to all others except those grown at Farnham. In Kent hops are generally cultivated with the spade, and planted on mounds; the cost of manure, poles, and labour is very large, the crop is uncertain, and its produce varies greatly. Owing to the demand for hop-poles more attention is paid to the growth of underwood than to that of timber, and the extensive woods for which the county was once celebrated have greatly diminished, and are rapidly disappearing. The best poles

Kent.

Kent. are those of chesnut, willow, ash, and maple, and they are generally cut from wood of from ten to fourteen years' growth. Another peculiar production of the county is seeds, especially canary and radish seeds, which form a main crop in the Isle of Thanet. Filberts are another peculiar production; the trees grow well in a rocky and gravelly soil, and are planted 12 feet apart. Only one stem is allowed to grow, and this a few inches above the ground; the branches on it are not suffered to rise higher than 5 feet, and are trained into the shape of a punchbowl; for thus the trees yield the most abundantly. Kent is, in truth, the great fruit and kitchen garden of London. Pease, asparagus, cabbage, and other vegetables are cultivated by the acre in the neighbourhood of the metropolis; kidney beans are raised to the same extent at Sandwich; there are orchards of plums and cherries, as well as of apples and pears, scattered throughout the county, but they are especially numerous in the district between Maidstone and Canterbury. There, the common plan is to plant hops, apples, cherries, and filberts in alternate rows, or two rows of filberts between a row of apples and a row of cherries. It is scarcely surprising if, under these peculiar circumstances, the agriculture of Kent is not so forward as in other counties. The rich grass cultivation which is at once the pride and peculiarity of England, is but little adopted; nor has draining been generally employed, though it would greatly improve the refractory clay soil of the county. The plough still in use is mounted on two wheels, 3 feet high; it has a beam 10 feet long, and a share 20 inches, and requires four horses in the lightest soil, and six in the stiffest. With a lighter plough two horses would be sufficient for the work. The other implements are in keeping with this unwieldy instrument, and thrashing is very generally performed with the flail. There is nothing remarkable in the stock of Kent, with the exception of the valuable breed of sheep already mentioned, which combines superior wool with the highest quality of mutton. The great national types of stock will be sought in vain in this county.

The other natural productions of the county are—salt, which is obtained at Sandwich and in the Isles of Grain and Thanet; iron pyrites, found in the Isle of Sheppey, and largely manufactured into copperas for exportation; and fish caught on the coast for the London market, and amongst them a large quantity of oysters, which are reared in artificial beds at Milton.

There are two canals in Kent. The Royal Military Canal, 23 miles long, connects the sea at Hythe with the River Rother, in Oxney Isle, and was constructed to facilitate the defence of the country during the threatened invasion of Napoleon I., but it is now converted to the peaceful purposes of commerce. The second canal is a short cut from the Stour at Sandwich, to the sea, its object being to avoid the circuitous course of the lower part of that river. There was, until of late years, a third canal, 9 miles long, extending from Gravesend to Frindsbury, opposite Chatham, by which vessels avoided a tedious circuit of 47 miles round the Isle of Grain, but this has been converted into a railroad. The county is intersected by the South Eastern Railway, which forms the great high road, *viâ* Folkestone and Dover, between London and the Continent; the branches of this line reach nearly every town within the county.

Kent has very little foreign commerce, though it is seated on a great river, and abuts on the sea. This arises from the badness of its harbours, and the proximity of London, which is naturally the reservoir of the business of the counties forming its outskirts.

Formerly there were extensive iron-works in the Weald of Kent, where iron ore is found; but since coal has been substituted for the dearer charcoal in the manufacture of iron, these works have been extinguished. Cloth and silk

were formerly manufactured largely, but these branches of industry have been destroyed by the competition of Yorkshire. Calico-printing and bleaching are carried on to a limited extent; bagging is made for hops; ware is made at Tonbridge, and gunpowder at Faversham and Dartford. Paper-making is general throughout the county. But the chief manufacture, so to speak, is that of ships, and the *matériel* of war. At Deptford, Woolwich, Sheerness, and Chatham, the government maintains large ship-building yards, in which, during the war of 1854–6, upwards of 5000 artisans were employed; and at Woolwich, there is an extensive arsenal, the largest in the world, for manufacturing and storing arms and equipments. It may be added, that the Nore, at the mouth of the Medway, is a naval station, and that a fleet of men-of-war is generally at anchor there.

The population of Kent amounted, in 1821, to 427,224; 1831, 479,558; 1841, 549,353; 1851, 615,766. Of these last, 471 were landed proprietors; 4659 farmers; 209 graziers; 40,943 out-door agricultural labourers, and 4994 in-door; 3651 post-office, inland revenue, customs, and other government officers; 6961 soldiers; 1254 marines; 415 military and 496 naval officers; 1081 seamen R.N.; 283 Greenwich pensioners; 4537 merchant seamen; 1225 fishermen; 1571 boat and barge men; 3997 male, and 25,457 female domestic servants.

The following was the population of the principal towns in 1851:—

Canterbury	18,398	Maidstone	20,740
Chatham	28,424	Margate	9,107
Dartford	5,763	Ramsgate	11,838
Deal	7,067	Rochester	14,938
Dover	22,244	Sheerness	8,549
Folkestone	6,726	Tunbridge Wells	10,587
Gravesend	16,633	Woolwich	32,367
Greenwich	105,784		

The number of houses was, in 1841, 101,332, and in 1851, 114,475. The area of the county was 1,041,479 statute acres, and the amount of real property assessed to the income-tax in 1851 was L.3,152,173.

For civil purposes the county is divided into 5 "laths," and these are sub-divided into 63 hundreds and 415 parishes, with 2 cities, Canterbury and Rochester, and 26 market-towns. The term "lath" is derived from the Saxon word *gelathian*, to assemble; in the times of the Saxon heptarchy, when Kent formed a separate kingdom of itself, the principal men of the hundreds within each of the "laths," used to assemble to regulate the affairs of the entire district. For legal and political purposes, the county is divided into East and West Kent; each division returns two members to the House of Commons, and the election for the former takes place at Canterbury, for the latter at Maidstone. The cities of Canterbury and Rochester also return two members each; the borough of Maidstone two; the cinque ports of Dover, and Sandwich with Deal and Walmer attached to it, two each; Hythe, with Sandgate and Folkestone attached, one; Greenwich, with Woolwich and Deptford attached, two; and Chatham one. The total number is eighteen.

The Cymri were the first settlers in Kent, and were followed by the Belgæ. The county afterwards became famous in history. Cæsar, when he invaded Britain, landed on its coast, it is thought on the flat shore between Walmer and Sandwich. The North Foreland is the Acantum of the historian Ptolemy. Hengist and Horsa, the Saxon allies of the ancient Britons, landed in Pegwell Bay in 445, and received a grant of the Isle of Thanet, which was then really an island, separated from the mainland by wide channels. St Augustine, "the apostle of the English," landed in the Isle of Thanet in the year 596. Ethelbert, King of Kent, was the first Christian king of England, and his subjects the first Christian people. The first

Kent.

Christian church in the island was also built at Canterbury, and it formed the nucleus of Canterbury cathedral. In the struggles of the Saxons between themselves, and against the Northmen, Kent provided a perpetual battlefield; and, so great was the courage of the Kentish men, that they obtained the right of forming the van of the Anglo-Saxon forces. About the end of the seventh century, Kent became subject to Mercia; and, in 823, it passed under the supremacy of the West Saxons, and became the appanage of the heir-apparent of the King of Wessex. Just before the battle of Hastings, William the Conqueror burnt Romney, and massacred the inhabitants, for having defeated a detachment of the Norman forces which had landed there. After the battle he burnt Dover, and hanged the governor of the castle; but during his march to London he found it expedient to confirm the privileges of the Kentish people. King John submitted to the pope's legate, Pandulph, at Dover, in the year 1213. The Dauphin of France made a descent in the Isle of Thanet in 1216, when he invaded England to assist the barons against John. Wat Tyler's insurrection broke out in Kent in 1381, and Jack Cade's in 1450. At the commencement of the disastrous War of the Roses, in 1451, the Duke of York fortified himself at Dartford; and, in 1554, Sir Thomas Wyatt raised the standard of rebellion against Queen Mary. In 1648 a desperate battle was fought at Maidstone between the troops of Charles I. and the Parliament, the latter being victorious; and, in 1667, during the reign of Charles II., a division of the Dutch fleet under De Ruyter, violating a treaty of peace, sailed up the Medway, broke the chain stretched across the river, burnt several ships at Chatham, and carried off the "Royal Charles." It may be added, that three of the most remarkable English sovereigns, Henry VIII. and his daughters, Mary and Elizabeth, were born in Kent, in the palace at Greenwich, now the hospital.

Kent, it has already been stated, formed a separate kingdom in Saxon days. It still retains many peculiar customs. The most remarkable amongst these is the tenure of gavelkind, by which the land of a father dying without a will does not descend absolutely to the eldest son, as the case is in the rest of England; but is shared by all the sons, and, in default of sons, it is shared by the daughters. According to Tacitus, this custom was derived from the ancient Germans; but there are many conjectures respecting its origin. Its effect has been to subdivide the ownership of the soil, and raise up the race of yeomen, for which the county has always been celebrated. A distich, still quoted in honour of the Kentish yeomanry, runs,—

"A knight of Cales, a gentleman of Wales, and a laird of the north
[countree,
A yeoman of Kent, with his yearly rent, will buy them all three."

The tenure of villinage never existed in Kent; and in the olden time a man had only to show that his father was born in Kent to be exempt from the bondage imposed upon the bulk of the people. The inhabitants were, therefore, emphatically called "men of Kent," it being held that a bondsman was no man, and the distinction is still cherished by the fine-spirited natives of the county. The number of yeomen tilling their own land is still considerable in Kent, principally in the hilly districts, but they are rapidly disappearing before the new constitution of property and farming.

The county is strewed with antiquities, and with historical sites. There are also several Saxon and Danish earthworks and encampments. Near Aylesford there is a remarkable cromlech, formed of four large stones, called Kit's Coty House. It is commonly supposed to be the monument of Catigern, son of Vortimer, the British commander, killed in a battle fought there in 454 against Hengist and Horsa, the latter of whom was also slain; but

whether the cromlech is a British or a Saxon work, antiquarians cannot determine. There are remains of Roman stations at Reculver, Dover, Lymne near Hythe, Richborough, and other places. Richborough Castle, situated near Sandwich (which was the ancient point of communication with the Continent), is one of the noblest of the Roman remains in England. The Roman road, Watling Street, passes through the county from Dover to the metropolis; and there are many other monuments of the Roman occupation. The ecclesiastical remains are very interesting. The church of St Martin, at Canterbury, is supposed to be the oldest Christian edifice in England. The abbey of St Augustine's (Canterbury), Faversham, Malling, Aylesford, St Radigund's near Dover, Boxley near Maidstone, West Langdon, Bilsington, Aylesford, Monk's-Horton, and one belonging to the Benedictines, near Dover, still linger in ruins, parts of some of them having been turned to useful purposes. The churches of the county are remarkably good, and amongst them are two fine cathedrals, those of Canterbury and Rochester. The church of Barfreston, between Canterbury and Dover, is a highly interesting edifice of Anglo-Saxon or early Norman architecture. Of the secular buildings, the chief are Hever Castle, on the River Eden, near the border of Sussex, the seat of the Boleyns, where Henry VIII. courted Queen Anne; Allington Castle, near Maidstone, the seat of the Wyatts; Chilham Castle, near Canterbury; and the hall and gateway of the royal palace at Eltham. Besides these, are the castellated mansions of Leeds Castle, near Maidstone, formerly the residence of Richard II. and Henry IV.; Knowle, near Sevenoaks, the seat of the Dukes of Dorset; and Penhurst Castle, the seat of the Sydneys. On the coast are the castles of Sanddown, Sandgate, Deal, and Walmer, which are fortifications rather than residences; the latter will ever be famous as the residence and death-place of the great Duke of Wellington, being attached to his office of Governor of the Cinque Ports, four of which (Dover, Hythe, Romney, and Sandwich) are situated in Kent. Nor must we forget the national asylum for disabled and aged seamen, Greenwich Hospital, the fittest and noblest institution of our maritime nation, and fully justifying, in the character of its architecture, one part of the French criticism, that "in England the palaces are built like hospitals, and the hospitals like palaces." Adjacent to it is the Royal Observatory.

(F. C.)

KENT, WILLIAM, the father of modern landscape-gardening, was born in Yorkshire in 1685. His parents, persons in humble life, apprenticed him to a coach-painter; but he soon became conscious that he had talent for a much higher walk of art, and set off to London to seek his fortunes there as a portrait and historical painter. He had the good luck to fall in with kindly patrons, who supplied him with the means of completing his studies in Italy. After a six years' residence in that country he became acquainted in 1716 with the Earl of Burlington, with whom he returned to England, and under whose roof he continued to reside till his death in 1748. The studies of both lay in the same direction, and the patron, from his wealth and position, was able to procure many commissions for his protégé. Abandoning altogether pictorial art, in which he was never likely to attain any distinction, Kent henceforth found his true sphere in architecture and landscape-gardening. Of the latter of these arts, as now practised in England, he may justly be regarded as the father. The Temple of Venus at Stowe, and the splendid palace of the Earl of Leicester at Holkham in Norfolk, are attributed to him, and, if really his, do great credit to his architectural taste and talent. In the ages previous to his, artists had been held to succeed in proportion as they banished every touch of nature from their designs; and every garden with the least pretensions to fashion was filled with giants, animals, monsters, coats of

Kent,
William.

Kentucky. arms, and mottoes in yew, box, and holly. Absurdity could go no further, and luckily at this moment Kent appeared painter enough, in the words of Walpole, "to taste the charms of landscape, bold and opinionative enough to dare and to dictate, and born with a genius to strike out a great system from the twilight of imperfect essays." Nature was everywhere restored, and the old absurdities were discarded for ever. Gardens and lawns were from this time laid out according to the laws of perspective, and light and shade. A similar reformation was effected in the management of water; canals, circular basins, and cascades tumbling down marble steps, were supplanted by streams which seemed to wind away at pleasure, and were lost and restored to view again at proper intervals. Not seldom his imitations of nature were carried too far, as when, in Kensington Gardens, he planted dead trees to give a greater air of truth to the scene. But he was easily laughed out of this extreme, whose folly he was himself one of the first to detect. As a sculptor, Kent never attained any eminence. The well-known statue of Shakspeare in Westminster Abbey is from his chisel, and does very little credit either to his taste or judgment.

KENTUCKY, one of the western states of N. America, is bounded N. by the Ohio, separating it from Ohio, Indiana, and Illinois, W. by the Mississippi, separating it from Missouri, S. by Tennessee, and E. by the Cumberland Mountains and Big Sandy River, which divide it from Virginia. Its greatest length E. and W. is 368 miles; average breadth 150. Area 37,680 square miles, of which about the half was cultivated in 1850.

The face of the country for the most part is level or undulating. The most elevated land is in the S.E., where the spurs of the Cumberland Mountains traverse several of the counties. Their elevation nowhere exceeds 2000 feet. A range of hills, intersected by deep narrow vales, runs nearly parallel with the Ohio at a distance of from 5 to 20 miles. Between the hilly region of the E. and N.E. and Green River, extends an undulating and fertile tract of about 150 miles long, embracing more than half the area of the state. The district between Green and Cumberland Rivers, known as the "Barrens," is chiefly occupied as pasture-land; that to the W. of Cumberland River is mostly flat and moderately fertile. The country generally is well wooded, and the hills are crowned with lofty trees. All the principal streams are tributary to the Ohio, which washes the northern boundary of Kentucky in its entire extent, giving a steamboat navigation of above 600 miles, and opening to the state the inland commerce of the Ohio Valley. In like manner the Mississippi on the W. gives access to the commerce of the vast territory beyond. The Big Sandy forms the eastern boundary of the state for about 100 miles. It enters from Virginia, flowing northward into the Ohio, and is navigable for about 50 miles. The Licking, Kentucky, and Green River have their entire course within the state. They all rise in the Cumberland Mountains, and flow W. and N.W.; the two latter are navigable respectively to distances of 60 and 150 miles. The Cumberland River also rises in the mountains of that name, flows W. and S.W. for about 300 miles, makes a bend of above 200 miles into Tennessee, and re-enters Kentucky about 80 miles from its junction with the Ohio. It is navigable for steamers to Nashville in Tennessee. The Tennessee River has about 70 miles of its course in Kentucky, and enters the Ohio about 10 miles below the Cumberland.

The prevailing geological formation throughout Kentucky is the blue limestone, which is much used for building. A good marble is found among the cliffs of the Kentucky River. Sandstone is also common, and extends from Louisville to Danville. Bituminous shale and pudding-stone are also abundant. The lime-stone region abounds in caverns, sinks (deep conical hollows), and sub-

terranean water-courses. Into these latter the smaller streams disappear during the dry season. Of the caverns, the most celebrated is the Mammoth Cave, which is regarded as one of the chief wonders of the American continent. It lies near Green River, in Edmonson county, and consists of an endless series of lofty chambers connected by long narrow galleries, supposed to extend in all their ramifications to more than 40 miles. Near the entrance, which is reached after a descent of 80 feet, is a great antechamber, 200 feet long, 150 feet wide, and 50 feet in height: here have been found large quantities of gigantic bones. In one chamber mummies have been discovered; from the roof of another hang clustering countless legions of bats; the waters of the cave are inhabited by a species of fish absolutely destitute of eyes; and one chamber has been converted into a residence for consumptive patients, to whom its pure and mild air is found beneficial. Another place of much interest to the naturalist is Big Bone Lick, near the banks of the Ohio, so named from the fossil remains of antediluvian megatheria found there in large quantities. Of these many have found their way to Britain.

The coal-beds of Kentucky, which extend from the neighbouring states on the N. and E., occupy a vast area, but have hitherto been worked to a very inconsiderable extent. Iron is equally abundant, but of inferior quality, and it also has been comparatively neglected. Lead and silver are found in small quantities. Salt springs or "licks" (so called by the early settlers, from their being favourite resorts of wild animals, which regaled themselves by licking the mineral) abound in the sandstone formation; and nitrate of lime and gypsum are found in the caves. Mineral springs are numerous.

The climate is salubrious, the thermometer seldom rising above 80°, or descending below 25°, in the centre of the state. The mean annual temperature is about 58°. The best soil of Kentucky is that of the limestone formation. The most fertile portion of the state, and surpassed by few tracts in America, is that watered by the Licking, Kentucky, Dick's River, and the upper course of Green River; the soil is a loose black mould, the product of the dense forests which at one time covered the face of the country. Of these there are still considerable remains, and the variety of trees, some of which, as the poplar, attain enormous dimensions, is as great as in any of the states. Among the more common trees in the cultivated districts are the paw-paw, sugar-maple, honey-locust, and coffee-tree. The *Panicum virgatum* which grows in dense brakes to the height of 12 feet, affords rich pasture for cattle.

The principal agricultural products of Kentucky are flax, hemp, and tobacco. Of the entire crop of these raised in the states, Kentucky yields respectively five-eighths, four-sevenths, and above one-fourth. The number of farms in 1850 was 74,777; the extent of improved land in farms 5,968,270 acres; of unimproved 10,981,478 acres. The cash value of these farms was estimated at L.31,204,250, ranking it fourth in this respect among the states. In production of wheat it stood eleventh; of oats, third; of Indian-corn, second; of wool, seventh. The crop of wheat was 2,142,822 bushels; of maize, 58,672,591 bushels; of oats, 8,201,311 bushels; potatoes, 1,492,487 bushels; of tobacco, 55,501,196 lbs; of wool, 2,297,433 lbs; of flax, 2,100,116 lbs.; of hemp, 17,787 tons. The number of horses was 315,682; milch cows, 247,475; working oxen, 62,274; other cattle, 442,763; sheep, 1,102,091; swine, 2,891,163; total value of live stock, L.5,932,800. Produce of butter, 9,947,523 lbs.; cheese, 213,954 lbs.; bees'-wax and honey, 1,158,019 lbs. The principal fruits reared are apples and peaches, from which cider and brandy are extensively manufactured for home consumption. The industry of the state is mainly agricultural; the chief manufactures are leather, tobacco, woollens, cotton, ropes, &c.

Kentucky. Its foreign commerce is limited, and passes chiefly through New Orleans. The amount of shipping (all steamers) in 1850 was 14,820 tons. The means of internal communication are extensive, the state being nearly insulated by navigable waters, with numerous tributaries, aided by canals and other works. Of these the most important is the Portland and Louisville Canal, constructed to obviate the difficulty to navigation caused by the Ohio Falls. This important work is about 3 miles long, and has been for the most part hewed out of the solid limestone: the cost was L.240,000. Several railways are in operation, of which the chief are the lines connecting Louisville, Frankfort, Lexington, and Covington; and other lines are in progress.

There were in 1851 five banks, with twenty-one branches, in Kentucky, with an aggregate circulation of L.1,522,650. Capital, L.1,507,400; deposits, L.464,750.

The population in 1850 was 982,405, of whom 761,417 were whites, 10,007 free coloured, and 210,981 slaves; 601,764 were natives of Kentucky. The state is divided into 100 counties. The capital is Frankfort, in the county of Franklin, but the largest town, and the commercial metropolis of the state, is Louisville, which in 1853 had 57,726 inhabitants. After it in population come Covington, Lexington, Newport, Maysville, Frankfort, and Paducah. The state legislature consists of a governor, elected by the people for four years, a senate of 38 members, elected for a like term, one-half every two years, and a house of representatives of 100 members, elected for two years. Kentucky sends 10 members to the national congress, and has 12 votes in the presidential election.

The state revenue in 1854 was L.177,050; the expenditure, L.154,690; the public debt, L.1,229,470; the assessed value of property, L.81,166,000. The rate of taxation, 17 cents for every 100 dollars' worth of property. The judicature consists of an appeal court, composed of one chief justice, and three associate judges, with salaries of L.417 each; a court of chancery, presided over by a single chancellor, salary L.375; twelve circuit courts and county courts, consisting of a presiding judge and two associates. All these officials are popularly elected. There are also two justices of peace and a sheriff in each county. The state militia, in 1852, numbered 88,979 men. Education is provided for by a state school fund, amounting, in 1854, to L.280,070, and an annual property-tax yielding about L.15,600. The number of children between five and sixteen, in 1854, was 227,123, of whom 207,210 were on the school books; the average attendance was 76,429. There were, in 1852, 8 colleges with 656 students, besides 2 medical schools, with 590 students, two law schools with 125 students, and 1 theological school with 18 students. The principal colleges are the Louisville University, and the Transylvania University at Lexington. Of religious denominations the most numerous are the Baptists, next to them the Methodists; total number of places of worship in 1850, 1818; value of church property, L.452,030. The number of newspapers and periodicals published in 1850 was 67,—9 daily, 5 tri-weekly, 4 bi-weekly, 41 weekly, 1 fortnightly, and 7 monthly; their total annual circulation, 6,582,838 copies.

The first pioneers of civilization in Kentucky were Boone and Knox, whose exploits and perils are among the most cherished traditions of the Kentuckians. The first settlement was established between 1760–70. At first Kentucky was a county of Virginia; it was declared independent in 1790, and was admitted into the Union in 1792. The inhabitants still retain much of that frank and hospitable, if sometimes boisterous, style of life and manners inherited from the bold hunters who first wrested the land from the dominion of savages and beasts of prey. Certain relics of antiquity seem to indicate that at a very remote period this

country was possessed by a race not unacquainted with the arts of civilization. The most remarkable of these are the traces of regular fortifications on the banks of the Ohio, opposite Scioto River.

KENYON, LORD, an eminent English lawyer, Chief-Justice of the King's Bench from 1788 to 1802, was born in 1732, at Greddington, in Flintshire. Such early training as he had he received at the grammar-school of Rathin; but he had only some small progress in the Latin grammar when he was withdrawn, and at the age of fourteen articulated to an attorney in extensive practice at Nantwich, in Cheshire. During his seven years' apprenticeship he showed such aptitude for legal studies, that he became a great favourite with his master, and was even led to hope that in course of time he would be admitted to a partnership in the business. Disappointed in this hope, he resolved to prepare himself for the English bar. Proceeding to London in 1754, he entered Lincoln's-Inn; and, seven years later, was called to the bar. Without friends, and too proud to stoop to the small arts by which success is reached, he remained for many years poor and unknown. Still hopeful, he attended regularly the courts of equity and common law (especially the former), and was equally punctual at sessions and circuit. At last, by slow degrees, he began to make way as an equity draftsman and conveyancer; and, having attracted the notice of Mr Thurlow, then attorney-general, he had soon more to do than he could overtake. In 1779 he was associated with Mr Erskine as leading counsel for Lord George Gordon, then on his trial for high treason. Three years later he was made attorney-general under the Rockingham administration, and retained office when Pitt became Chancellor of the Exchequer. In 1784 he became Master of the Rolls, and was made a baronet; and, four years later, he succeeded Lord Mansfield as Chief-Justice of the King's Bench, with the title of Lord Kenyon, Baron Greddington. His elevation to this high office gave great offence to the lawyers, with whom Kenyon was very far from being popular. His *personnel* was very little calculated to recommend him to the profession. Deeply learned in the law, he was quite ignorant of everything beyond its pale. He was a very poor orator; and his manners, always ungracious, were often irritating, and even insolent in the extreme. Hating show and pomp of every kind, he dressed shabbily, drove a miserable equipage, and almost never entertained. On the bench he ruled like a despot, and would never allow even his brother judges to express opinions differing from his own. To the counsel who appeared before him he was still more stern and arbitrary, and often put down any freedom of thought or speech on their part in cruelly harsh and undignified language. With the public, on the other hand, Lord Kenyon was in the highest degree popular, chiefly on account of the inflexible impartiality with which he administered justice. The vices and crimes of the higher classes he punished more severely in proportion to the rank and wealth of the offenders. He often threatened, that if the highest lady in the land were brought before him and convicted of gambling, she should stand on the pillory for it. Libels, and especially political libels, he also punished with rigorous severity. In the case of poor offenders, or such as he believed to have been betrayed into crime by designing persons, he was always merciful; and, though his great maxim was, that the law was no respecter of persons, he sometimes strained it in their favour.

From his complete destitution of literary accomplishment, Lord Kenyon's decisions, though now regarded as of the highest authority, were often so ill-reasoned and obscurely worded, as to be far from satisfactory; and thus the value of the adjudication was damaged by the apparent unsoundness of the grounds on which it was based. This defect was also due in some measure to the haste with which he

Kenyon.

Kepler
||
Kerman.

pushed through his work. He often despatched between twenty and thirty cases in the course of a single day.

Lord Kenyon died in 1802, in the fifteenth year of his public life as Chief-Justice of the King's Bench. His death is said to have been hastened by the loss of his eldest son, who was to have inherited his title and the immense fortune which he had amassed.

KEPLER, JOHN. See DISSERTATIONS IV. and V.; and art. ASTRONOMY, Parts I. and IV.

KERBELA, or MESHED HOSSEIN, a large and populous city of Asiatic Turkey, pashalic of Bagdad, and 60 miles S.W. of the town of that name. It is surrounded by a wall upwards of 2 miles in circumference, is entered by five gates, and has a well-supplied bazaar, and several caravansaries. The chief ornaments of the city, however, are the tomb of Hossein, adorned with a lofty gilded cupola, and a magnificent mosque. Its ancient name was *Vologesia*; but it was an inconsiderable place till Hossein, the son of Ali by Fatima, the daughter of the prophet, was interred here, having been slain in the vicinity, when it became a great resort of pilgrims. An ancient canal connects this town with the Euphrates.

KERESOON, or KERASAN (the ancient *Cerasus*), a seaport-town of Asiatic Turkey, on the Black Sea, government of Trebisond, and 75 miles W. by S. of the town of that name, in N. Lat. 40. 57. 10., E. Long. 38. 24. It is situate on a rocky promontory forming the western boundary of a spacious bay. The town, which is now in a very wretched and ruinous condition, appears to have been formerly a place of considerable strength and importance, and a considerable part of the ancient wall still exists. It has some ship-building, and carries on a small trade in corn with the Crimea. Pop. probably about 3000.

KERGUELEN LAND, or ISLAND OF DESOLATION, an island of the Indian Ocean, named after its discoverer, Kerguelen, a Frenchman, and visited by Captain Cook in 1779. It is almost totally destitute of vegetation, and has a cold and moist climate. The surface is rugged and mountainous, and the coasts deeply indented by bays and inlets. It is resorted to by numerous wild fowl and seals. N. Lat. 69. 30., E. Long. 49. 20.

KERKOOK (the *Demetrias* of Strabo, and the *Corcura* of Ptolemy), a large town of Asiatic Turkey, Lower Kurdistan, on the direct road from Bagdad to Mosul, 130 miles N. of the former, and 100 S.E. of the latter. It is a large open town, in a plain; but, like all the towns in this part of the world, is in great part in ruins. The streets are narrow and filthy, and the houses mean. It is said to have no manufactures except a coarse calico, but there is a considerable trade in gall-nuts, which are brought from the Kurdistan Mountains. There are numerous naphtha pits in the vicinity. Pop. about 13,000, Arabs and Osmanlis, with some Christians and Jews. N. Lat. 35. 27., E. Long. 44. 27.

KERMAN, or KIRMAN (anc. *Caramania*), a province of Persia, lying between N. Lat. 25. 30. and 31. 20., and E. Long. 54. 30. and 60. 20., having N. Khorassan, E. Afghanistan and Beloochistan, S. the Persian Gulf, and W. Laristan and Fars. It is about 380 miles in length from N. to S. by 250 in extreme breadth, and has an estimated area of 65,000 square miles. Kerman is represented as being a generally mountainous territory, but the greater part of it is comparatively unknown. A mountain chain, the Djebel Abad, intersects the province from E. to W., and sends off numerous ramifications southward towards the coast. N. of this chain, the country is in general a barren, dreary waste, without a single river to irrigate the land. Almost the only exception to this is the district of Nurman-sheer, about 90 miles in length by from 20 to 30 miles in breadth, and which is tolerably well watered by mountain streams, and has a good soil. A few productive spots are also to be found in the neighbourhood of mountain springs,

Kerman
||
Kerowlee.

or where subterraneous reservoirs have been made for irrigation. S. of the Djebel Abad, the country is very mountainous. Many of the plains and valleys are of great fertility, but here too are large tracts of barren waste. The principal river here is the Rud Shur, which flows southward into the Persian Gulf. The climate of Kerman is said to be less healthy than that of other parts of Persia. The chief productions are wheat, maize, barley, cotton, tobacco, saffron, madder, gums, and various kinds of fruits. The dates and grapes of particular parts are said to be very fine, but the other fruits are of inferior quality. White roses are extensively cultivated, the *attar* of these being highly esteemed. The mulberry tree is also largely cultivated for the breeding of silkworms. The rearing of cattle, sheep, goats, and camels, receives much attention. The inhabitants on the coast are chiefly engaged in fishing, but the pearl fishery, once so famous, has now been abandoned. The mineral wealth of the province is said to be considerable, but iron, copper, and sulphur, are the only products hitherto obtained. The manufactures comprise fine woollen fabrics, carpets, goats' and camels' hair shawls, coarse linens, and matchlocks. The southern part of Kerman, called Mogostan, is subject to the Imam of Muscat. Pop. about 600,000.

KERMAN, or *Sergan*, the capital of the above province, is situate at the western extremity of an extensive plain, and commanded by two old forts on the neighbouring hills, N. Lat. 29. 56., E. Long. 56. 25. It is surrounded by a mud wall and dry ditch, and is entered by four gates. It has a citadel, in which the governor resides, a well furnished bazaar, several large caravansaries, and numerous baths and mosques. Kerman was once the most important city in the empire, being the great centre of trade between the Persian Gulf and the countries to the N.E. and W. It has frequently suffered from hostile attacks, particularly in 1794, when it was taken by Aga Mahomet Khan, its walls and public buildings levelled to the ground, many of its inhabitants put to death, and 30,000 driven into exile. The rise of Bushire as a trading port has also taken away a great part of the trade of Kerman, which, however, is still considerable. It has also important manufactures of goats' and camels' hair shawls, carpets, and matchlocks. Pop. about 30,000.

KERMANSRAW, a town of Persia, capital of Persian Kurdistan, and of a cognominal district, 80 miles W.S.W. of Hamadan, in N. Lat. 34. 30., E. Long. 47. 12. It stands on the S.W. slope of a range of mountains near the right bank of the Kerkah or Karasu, and is surrounded by an earthen wall nearly 3 miles in circumference. It is said to be a very flourishing town, deriving great advantage from its situation on the great S. road from Persia into Asiatic Turkey. It has many public buildings, gardens, and baths. Chief manufactures, carpets and swords. Pop. about 30,000. About 6 miles from Kermanshaw are sculptures of Greek workmanship, commemorating the victories of the Persians over the Romans.

KERMES. See DYEING, Chap. IV., 3.

KEROWLEE, a town of Hindustan, and the principal place of a native state of the same name, situate in the province of Rajpootana. The houses are built of brick, and those of a superior class are faced with squared stone, but the streets are narrow and filthy. The territory of Kerowlee has an area of 1878 square miles, with a population of 187,000. Within the last few years, the distracted condition of this principality induced the reigning prince to solicit the interference of the British government, and a compliance with his request led to the restoration of tranquillity. Upon the death, in 1852, of the Rajah Nursing Pal, his adopted son, Bhurt Pal, was recognised by the British government as his successor, and arrangements were made for the administration of the state during the minority of the young prince. The total revenue of the country is stated at

Kerry. L.50,690, but so much has been alienated as to leave little more than two-thirds of that sum for the use of the state. The town of Kerowlee is in Lat. 26. 28., Long. 77. 10.

KERRY, a maritime county in the province of Munster, in Ireland, bounded on the N. by the estuary of the Shannon, which separates it from the county of Clare; on the E. by the counties of Limerick and Cork; on the S. by the county of Cork and part of Kenmare estuary; and on the W. by the Atlantic Ocean. The tribe of the Juvernii inhabited this part of Ireland when Ptolemy wrote. Previously to the English invasion, the O'Connors were in possession of the northern, the Moriartys of the central, and the O'Sullivans and O'Donoghoes of the southern portion of the district. The M'Carthys, who were the chief of the Irish septs in South Munster before the arrival of the English, retired into the wilds of Kerry when dispossessed of their more valuable tracts of country. In consideration of services rendered, Dermot MacCarty granted a considerable tract of this county to the celebrated English adventurer Raymond le Gros, who settled his son Maurice here. Maurice became so potent that he gave his name to the part of Kerry then called Lixnaw, from the ancient Luceni, as also to his family, the country being called Clanmaurice, and the family Fitzmaurice, to this day. In 1329 Maurice Fitzgerald, great-grandson of the first Lord of Kerry, was created Earl of Desmond. The county had been made shire-ground so early as 1210 by King John; but now the southern portion, together with a large part of the county of Cork as far as the mouth of the Blackwater, was formed into a palatinate in favour of the Desmond family, the head of which exercised an authority nearly equal to that of sovereign in the district until the close of the reign of Queen Elizabeth. After the attainder of Gerald, the sixteenth and last Earl of Desmond, the family estates were parcelled out among various English knights and gentlemen, viz.,—Sir William Herbert, Charles Herbert, Esq., Sir Valentine Browne, Sir Edward Denny, Captain Conway, John Holly, Esq., &c. On the breaking out of the rebellion of 1641 the native Irish regained possession of a considerable portion of the county, but their property was afterwards extensively confiscated, and among the new proprietors was Sir William Petty, whose estates, as well as those of the Fitzmaurices, are held by the Marquis of Lansdowne, who represents the ancient barons of Kerry. The county is at present divided into the eight baronies of Clanmaurice, Corkaguiney, Dunkerron, Glenarought, Iraghticonnor, Iveragh, Magunihy, and Trughanachmy, and extends over a surface of 1853 square miles, or 1,186,126 acres, of which 414,614 are arable, 726,775 are uncultivated, 11,169 are in plantations, 807 are occupied by towns and villages, and the remaining 32,761 acres are covered with water.

The county contains the two dioceses of Ardfert and Aghadoc, which have from time immemorial been united so intimately that the parishes belonging to each cannot be ascertained. In 1663 they were both allowed to be held *in commendam* by the Bishop of Limerick, and the union thus formed has not been since disturbed. This union of dioceses is the only one that has not been in some manner altered by the late arrangements for the reduction of the number of Irish bishoprics. The diocese of Ardfert includes the northern part of the county; the seat of the see is Ardfert, a small town, now little more than a village. The cathedral was burned in the wars of 1641, but a small part of the building was afterwards fitted up for divine service, and in 1831 was completely repaired. The seat of the diocese of Aghadoc, which comprehended the southern part of the county, is at a place of the same name, near Killarney, where the ruins of the cathedral are still to be seen. The number of parishes in the united dioceses is 88.

Previously to the Union, the county returned eight members to parliament,—two for the county, and two for each of

the boroughs of Tralee, Dingle, and Ardfert. At the Union the number was reduced to three,—two for the county and one for Tralee. The Reform Act made no alteration in this arrangement. Kerry is in the Munster circuit, and is divided for poor-law purposes into the unions of Cahirciveen, Dingle, Kenmare, Killarney, Listowee, and Tralee. The head-quarters of the constabulary force in the county are at Tralee, and sub-inspectors are stationed at Cahirciveen, Dingle, Kenmare, Killarney, Listowel, and Tralee.

The population of the county, according to the estimate of De Burgo, amounted to 56,628 in 1760; in 1792 Beaufort judged it to amount to 107,000. The first parliamentary census, taken in 1813, which, however, was very inaccurate, stated it at 178,622; that of 1821 gives 216,185; that of 1831, 263,126. The census of 1834 being returned according to dioceses instead of counties, prevents the specification of the amount of the population at that period; but from that return it appears that the dioceses of Ardfert and Aghadoc, which are nearly commensurate with the county, contained 304,687 souls, of whom 7529 were Protestants of the Established Church, 27 Protestant Dissenters, and 297,181 Roman Catholics. In 1841 the population was 293,880, which decreased in 1851 to 238,239. Of this number, 44,455 are returned as speaking only the Irish language, which is spoken by 61 per cent. of the population of the county.

The land in the northern part of the county is low, rich, and generally level, although it rises to an elevation of 710 feet above the sea in Maun Mountain, which occupies the centre of Kerry Head, a remarkable promontory projecting from the mainland into the Atlantic. The middle part is an upland, gradually rising to the E. and S.; the southern and western parts are almost wholly mountain, glen, and bog, comprising some of the highest points in Ireland. The loftiest of these, and the highest mountain in Ireland, is Carruntuohill, 3414 feet above the sea, being the summit of the range called M'Gillycuddy's Reeks, which stretches across the barony of Dunkerron, sending out branches in various directions. Next to Carruntuohill the highest summits are—Caper, 3200; Mangerton, 2756; Purple Mountain, 2739; and Coomenagh, 2446 feet above the ocean. To the west is the mountain of Drung, which rises precipitously from Dingle Bay to a height of 2104 feet; over the edge of the cliffs at an elevation of 200 feet, a road is carried, little inferior, says Inglis, in the magnificence of its mountain and sea views, to any of the celebrated roads along the shores of the Mediterranean, and every way superior to the road from Bangor to Conway in North Wales. In the barony or peninsula of Iveragh also rise the lofty summits of Cullen, 2231; Knockadubber, 2000; and Knockatubrid, 1556 feet high. More northerly are—Brandon Hill, 3127 feet; the Slieve Mish Hills, the Stacks, and the Glanruddery Mountains, all of inferior elevation to those already mentioned. These mountain ranges are intersected by deep and precipitous glens and ravines, possessing features of sublime and picturesque scenery. The most remarkable of these is the Gap of Dunloe, lying between Tomies and M'Gillycuddy's Reeks, formed by mountains on each side, nearly perpendicular; it has a flat base or floor, which renders the passage through it easy to both horsemen and pedestrians, and opens into a valley watered by a succession of mountain lakes, and terminated by a romantic waterfall. These valleys are the beds through which numerous small rivers take their course. The most northern rivers are the Feale, Gale, and Brick, which, having formed a junction near Rattoo church, form the Cashin, a wide but short tidal stream which runs into the estuary of the Shannon. The Maine runs from Castle Island to the head of Castlemaine Haven. The Flesk, after a winding course through Glan-flesk, falls into the Lower Lake of Killarney, from which it passes, under the name of the Laune or Lane, with a

Kerry. body of waters much augmented, into Castlemaine Haven. The Carra, rising in the mountains of Dunkerron, falls into the same bay. The Ferta and the Inny rise near Drung Mountain, collect the waters from the boggy uplands, and flow westward, the former into Valentia Harbour, the latter into Ballinskeligg Bay. The Ruaghty empties itself into the head of the estuary called Kenmare River. The Blackwater flows from the Dunkerron Mountains into Kenmare River, part of the boundary between this county and Cork. Lakes are numerous, but few of large size. The principal are the picturesque Lakes of Killarney. They are situated near the town of Killarney, at the northern side of the range of mountains of which the Reeks form the summit, and consists of three lakes, named the Lower (Lough Leane), the Middle (Muckross or Torc), and the Upper Lake. The first and second, which are on the same level, are separated only by a narrow peninsula, on which stands the fine ruin of Muckross Abbey, embosomed in lofty woods, and still retaining many fragments of its ancient grandeur and picturesque architecture. The Upper Lake, the level of which is five feet higher, is connected with the others by a river navigable by boats, a perfect specimen of close river scenery, and equally admired as the lakes themselves. The lower lake is studded with islands, of which the most remarkable, both for fertility and beauty, is Inisfallen, above 12 acres in extent, and contains, besides a small banqueting house, the ruins of an abbey of the same name, founded in 600, and the locality where one of the most ancient of the native chronicles, entitled the *Annals of Inisfallen*, was written. It consists of extracts from the Old Testament, a compendium of universal history down to the arrival of St Patrick in 432, and, thenceforward to the end, treats of the affairs of Ireland, finishing at 1319. The original, commenced A.D. 600, and continued during 500 years, is now preserved in the Bodleian Library at Oxford. On Ross Island are the ruins of Ross Castle, the garrison of which made a gallant stand against the parliamentary forces in the wars of 1641. Another, named O'Donoghoe's Prison, is supposed to have been used as a place of confinement by a chieftain of that name. The other more remarkable features of the Lower Lake are O'Sullivan's Cascade, and the Bay of Glenna, where there is an extraordinary echo. The Upper Lake has twelve small islets. The other lakes in the county are Lough Carrane, near Ballinskeligg Bay, containing several islands, Lough Brin, Lough Carra, and Lough Guitane, besides many of smaller extent.

The Lakes of Killarney are not of great size, the Lower Lake, which is the largest, covers 5001 acres, the Middle 680, and the Upper Lake only 430 acres. They are all exceedingly beautiful, but the Upper Lake, although smaller, has more grandeur. The numerous islets and wooded promontories diminish the extent of water seen at one time; but "almost every islet and promontory, whether rising from the water in steep, bare rocky cliffs, or sloping gentler down to it, is crowned with the most luxuriant canopy of trees, among which the arbutus, distinguished by its subdued and mellow green, is most conspicuous."

The coast is indented by several large bays. Nearest to the county of Cork is the great estuary called the Kenmare River, which contains some good harbours, and has many small islands along its shores. The next is Ballinskeligg Bay, to the N. of which are the Skellig Islands. On the largest of these, which is a lofty rock of slate rising several hundred feet above the level of the sea, there was formerly a convent, which was afterwards transferred to the mainland. Two lighthouses were erected on this island in 1826: one of the lights is placed 372 feet above the level of the sea, being the most elevated of all the lights on the Irish coast. The gannet breeds here, and nowhere else on the coast. N. of this bay, and separated from the mainland by a safe and capacious roadstead, is Valentia Island,

chiefly the property of the Knights of Kerry; the greater part of the island is under tillage, and it contains an extensive and valuable slate quarry, which is worked for export. Dingle Bay succeeds, containing within it Castlemaine, Ventry, and Dingle Harbours, and having the Blasquet Islands at its northern extremity. Dunmore Head, to the N.W. of this bay, is the most western point of the mainland of Ireland. Smerwick Bay, Brandon Bay, and Tralee Bay are adapted for smaller vessels only: between the two latter are the Magharees or Seven Hogs Islands. Ballyheige Bay, which is entirely exposed during westerly winds to the fury of the Atlantic Ocean, is separated from the Shannon by the bold promontory of Kerry Head. Within the mouth of the Shannon are the harbours of Ballylongford and Tarbert, the latter protected by the island of the same name. Nearly the whole of the coast of Kerry is bold and mountainous, adding much to the picturesque beauty of the district. The late Sir David Wilkie expressed an opinion that the county of Kerry, so nobly indented with bays of the Atlantic Ocean, and possessing a climate so favourable for vegetation, along with its mountains and inland waters, might, without injustice, be pronounced, in point of scenery, the finest portion of the British islands. Many plants, generally deemed suitable only for the genial atmosphere of more southern latitudes, grow here freely; and cattle remain frequently in the open air during the whole winter.

The soil in the northern parts of the county is retentive and coarse; the middle district is mostly of an alluvial character. The valley of the River Maine is entirely limestone. The uplands are chiefly argillaceous, but with limestone intermixed. The valleys in the mountainous region of the S. are mostly covered with bog; and, though at present little better than wastes, they are capable, from their favourable exposure, of being cultivated to advantage. All the limestone in the county is secondary, with marine remains and calc spar. The north-western coast to Kerry Head is composed of beds of argillaceous sandstone, nearly horizontal, in the parting of which, the quartz crystals called Kerry-stones are found. The midland district is mostly argillaceous, composed chiefly of slate clay and hard sandstone, covering beds of anthracite and culm, which has not been raised for fuel, partly on account of the abundance of turf, partly from the offensive vapour of the coal when ignited. The component rock of the mountains which form the whole of the southern district is of the clay-slate formation. The slate is quarried for roofing, particularly at Valentia Island. It is light and durable, splits readily, bears piercing, and is harder and more siliceous than that of Bangor. In all the mountains the common gritstone contains large quantities of quartz crystals. Detached blocks of it are also found in the valleys, in some places in such quantity as seriously to impede cultivation. Iron ore is found in great plenty in the southern parts, and was largely manufactured at Killarney and Blackstones, until the works were stopped by the failure of timber for fuel. Copper was raised at Ardtully, near Kenmare, at Muckross, and in Ross Island. The marble of Tralee is marked like that of Kilkenny, with more white spots; other kinds of marble have been raised in various parts. Fine amethysts have been found near Kerry Head. Potter's and pipe clay, a substance like tripoli, brown ochre, and fuller's earth, are to be met with in various places. The whetstones found near the Devil's Punch-Bowl are much valued. Fossil shells, particularly cardites and terebratulites, are frequent. Several mineral springs, some chalybeate, others sulphureo-chalybeate, have been discovered. Of the former, there is one near Killarney, another near Valentia Island, another at the mouth of the Inny, and several between Blackstones and Killorglin. Of the latter, the most celebrated are near Dingle, Castlemaine, and Tralee. A saline spring at Mag-

Kerry. herybeg, in Corkaguiney, rises a little below high-water mark, bursting out of a clear white sand.

The following tables exhibit the variations in the culti-

vation of the land, and the quantity of stock, in each year since 1847, when the agricultural returns were first collected and published by the Irish government:—

Kerry.

There are no manufactures of importance carried on in the county; the manufacture of coarse linen is mostly confined to the barony of Corkaguiney. A quality of narrow cloth, of strong texture, called bandle-linen, and also "box and trap," was formerly in demand for the army and the West India market. It owed its reputation to the careful method of preparing the yarn, but has fallen into disrepute. The manufacture of woollens is almost entirely confined to that employed in the domestic consumption, the rest being sent in the raw state to the Cork and Limerick markets. Flannels, however, are sold in some quantities in the markets of Tralee and Dingle.

The fishery is chiefly carried on at Dingle and Valentia, from the former in row-boats, and from the latter in sailing vessels. A fishery is also carried on along the shores of the Kenmare River. All kinds of round fish are taken, as are also herrings. Pilchards were caught in large quantities, but they have lately deserted the coast. Shell-fish of every kind are large and abundant. Salmon is caught in the rivers; but in some places the numbers are supposed to be considerably diminished by the seals which frequent the rocky shores.

The deep and extensive vales with which the mountainous district in the south is everywhere indented, are almost wholly occupied with bog, most of which, from its elevated position, and the declivities of the land, would admit of easy and profitable reclamation. The extent of bog throughout the county is estimated at 171,054 acres. One species of it, called by the people meagh-bone, or fat turf, is of a highly inflammable quality, and is therefore used more to give light than heat: a small piece applied to a lighted candle burns like a wax taper.

The county contains a vast extent of unimproved pasture land, amounting on the whole to 727,000 acres, the greater portion of which is situate within the elevated mountain promontories, to the N. and S. of Dingle Bay; but large tracts of low, and comparatively improvable, boggy lands, are situate in a cold clayey country, extending from Tarbert on the Shannon, by Listowel and Castleisland, to Kil-

larney, many parts of which are highly improvable, and are similarly circumstanced, in every respect, with the crown lands of Kingwilliamstown, in the county of Cork, where extensive land improvements have been effected. Similar, and very successful improvements were also made to the W. of Listowel, in this county, by the late Mr Pierce Mahony, which prove what can be done at a moderate cost in an extensive district which is similarly circumstanced. It is probable that, of the entire extent of waste lands of this county, about 150,000 acres may be drained and reclaimed, so as to produce corn and green crops: 250,000 acres may be drained, both for the purposes of pasture and coarse meadow; and 327,000 acres, consisting either of mountain tops or deep flat bogs, may be deemed incapable of improvement under present circumstances.

The county was once covered with timber, much of which has been cut down for the supply of the iron-works; but there are still many fine tracts of wood; and, even where the land has been cleared, its re-growth is prevented solely by the cattle; for, wherever these are excluded, the trees shoot up from the old roots so vigorously as often to choke up the young plantations.

Kerry, in acreable extent, is the third largest county in Ireland; but if we deduct from its aggregate area the waste of mountain and deep bog land which could not be improved at a profit, the district engineer reports that it will be found that in no other county has so much been done in the way of drainage and improvement on a given surface of available land, or with better and more satisfactory results; for, probably in no part of Ireland has agriculture made more rapid progress, whether in dairy or mixed husbandry, which is mainly to be attributed to the large sums expended under the provision of the drainage acts; for, consequent upon the thorough drainage of the land, followed an improved system of husbandry. The occupiers have been enabled to introduce a better rotation of cropping, and by degrees to introduce a different and superior breed of stock, so that the produce on the improved farm, whether as regards cattle, sheep, or corn, has been very

Kertch. much increased, but the great feature in the change is the extended breadth of turnips annually sown, this being the principal crop whereby to judge of the progress of agriculture in any district, it being the foundation of all good husbandry. In districts where nothing has been done in the way of drainage, the old system of agriculture is still pursued in its primitive form of lazy-bed culture, and alternate croppings of oats and potatoes.

Tralee, the assize town, with good open streets, and many good houses, is the largest in the county, and was once the chief residence of the Earls of Desmond, and the place where they held their palatine court. On the ruin of that family, it was made the county town, and obtained a charter, with the right of returning two members to parliament, which it retained till the Union, when it was deprived of one of its members. Previously to that period, the constituency was limited to the burgesses, fifteen in number, who were nominated by the proprietor of the town, Sir Edward Denny. It now consists of about 315 burgesses and householders. The town suffered greatly in the civil wars of 1641 and 1688. Its situation on the River Lee, about a mile from Tralee Bay, is healthy and picturesque, but not well adapted for trade, as vessels above 300 tons can approach no nearer than the Samphire Islands, six miles distant. The court-house and jail form one side of a square in the centre of the town. The other public buildings are,—the church, which is a fine modern structure, two Roman Catholic chapels, the Methodist and Independent meeting-houses, the county infirmary, the new court-house, and an infantry barrack for 600 men. The remains of one of the four castles belonging to the Desmond family are still in existence. At some distance from the town is a celebrated sulphureo-chalybeate spa. The population in 1851 amounted to 9957. The next town in rank and population is Killarney, which owes its celebrity chiefly to the lakes in its neighbourhood; and there were formerly extensive iron and copper mines wrought here. Mennius states, that there were four circles of mines round this town; tin, lead, copper, and iron. Tin has not been found here in modern times. Lord Kenmare's seat is contiguous to the town. Its population is 5962. Dingle, a place of some trade, and a fishing station, contains 3262 inhabitants. The population of the other towns which have more than 1000 inhabitants each, is as follows:—Listowel, 2126; Castleisland, once the county town, but now a declining village, 1005; Tarbert, 1000; Ballylongford, a rising seaport on the Shannon, with a very improveable harbour, 1862; Cahirciveen, 1862; and Kenmare, at the head of the estuary of the same name, 1509. (H. S.—R.)

KERTCH, a fortified town and seaport of Russia, on the eastern coast of the Crimea, stands on a small peninsula at the mouth of the strait of Yeni Kaleh, about 10 miles S.W. of the town of that name. From its commanding position between the Black Sea and the Sea of Azof, it is, both in a commercial and military point of view, a place of considerable importance. The streets are regular, the houses well-built of stone, the harbour good, strongly fortified, and generally filled with shipping. All vessels entering the Sea of Azof do quarantine here for four days. Pop. about 10,000. The present town is built close to the site of the ancient Panticapæum, the last residence of Mithridates the Great. In the neighbourhood are numerous tumuli, some of them of enormous size, in which there have been discovered large quantities of Grecian antiquities of the most exquisite workmanship. The best part of these is at St Petersburg, but a very valuable collection, preserved in the museum at Kertch, was barbarously destroyed or pillaged by a mob of drunken soldiers, after the capture of the place by the allied forces of Britain and France in May 1855. Subsequent excavations by Dr D. M'Pherson brought to light what seems to have been the burying-place of the

Scythian kings, as described by Herodotus. The hill near the town is still called after Mithridates, who is said to have reviewed his troops from its summit, before his last expedition against the Romans. The peninsula of Kertch was colonized by Milesians about 500 B.C. About 50 B.C. it became part of the Roman empire, and in A.D. 375 it fell into the hands of the Huns. In 1280 it was occupied by the Genoese, who were driven out by the Turks in 1473. It was seized by the Russians in 1771, and formally ceded to them in 1774.

KESWICK, a market-town of Cumberland, 30 miles S. of Carlisle, is delightfully situated on the left bank of the Greta, close to the Lake of Derwentwater, and beneath the shadow of Skiddaw. It is one of the chief stations for visitors to the lakes, surrounded as it is by one of the finest landscapes in England. It was for many years the residence of Southey, whose house, Greta Hall, stands close by the river side. There is a monument to the poet in the parish church, a handsome building in the perpendicular style. Keswick is noted for its manufacture of lead pencils; the mineral, of the finest quality, is obtained in the neighbouring mines of Borrowdale. It has a public library and reading-room, and two museums illustrative of the mineralogy of the neighbourhood. Pop. 2618.

KESZTHELY, a town of Hungary, county of Szalad, near the W. end of Lake Balaton, 96 miles S. of Presburg. It is the seat of a very complete agricultural college, called the Georgicon, after its founder Count George Festetics. The inhabitants, numbering about 8000, are chiefly employed in the manufacture of wine and of woollen cloths.

KETSKEMET, a town of Hungary, county of Pesth, 50 miles S.E. of Buda. It is irregularly built, in the midst of a level country, which breeds large numbers of horses and cattle. The cattle-market is the largest in Hungary. The inhabitants are chiefly employed in the rearing of livestock, and in the manufacture of wine, soap, and leather. Pop. (1851) 32,308.

KETTERING, a market-town of Northamptonshire, is built on a slope near the Ise, a tributary of the Nen, 13 miles N.N.E. of the county town. The principal building is the church, a good specimen of the perpendicular style, with a fine old tower, surmounted by a crocketed spire. The principal manufactures are silk plush for hats, woollens, and shoes. Pop. 5125.

KEW, a small village and parish of Surrey, pleasantly situated on the right bank of the Thames, 6 miles W. of Hyde Park Corner. A stone bridge of seven arches connects it with Brentford, on the opposite bank. The great object of interest at Kew is the gardens. The old palace here, built in the time of James I., was long the favourite home of George III., who, carrying out the designs of his parents, greatly improved and enlarged the grounds. These, which embrace, inclusive of the Botanic Garden, an area of about 245 acres, were, in 1840, placed under the management of the Commissioners of Woods and Forests, and opened to the public. The Royal Botanic Garden, occupying about 75 acres, was begun by the Princess of Wales, mother of George III., and received continual additions during the reign of her son; but not till the recent improvements, under the able direction of Sir William Hooker, did the arrangements of the establishment entitle it to be regarded as one of the most complete in the world. The palm-house was, at the time of its erection, a wonder in architecture, being built of iron and glass, of the length of 362 feet, by a breadth of 100, and height of 66 feet in the central compartment. The whole of the grounds are laid out with admirable skill and taste. The most prominent object in the pleasure-grounds is a Chinese pagoda of 10 storeys, 163 feet high, and commanding an extensive view.

KEY, or **CAT**, a common name given to many of the

Keswick
||
Key.

Key Islands on the coast of Florida and Central America. See **BAHAMAS**.

KEY ISLANDS. See **KI ISLANDS**.

KEY WEST, an island of the United States of North America, part of Monroe county, Florida, and one of the Pine group, forming the most southern territory of the United States, N. Lat. (of lighthouse) 24. 32. 58., W. Long. 81. 48. 7. It is 4 miles long by 1 in breadth at the widest part. Its position commands the trade of the Mexican Gulf, an advantage of which the government have availed themselves by constituting it a naval and military station. Like the rest of the Archipelago it is a coral formation, and has but a scanty soil. The climate, however, is so salubrious that Key West has become the resort of invalids from the Northern States. The inhabitants trade in wrecks, salt, sponges, and coral. Key West town has a safe and convenient harbour much resorted to. Pop. of town about 3000.

KEYNSHAM, a market-town of Somersetshire, at the confluence of the Chew and Avon, nearly equidistant (5 miles) between Bath and Bristol. It consists of one long street, and has a fine large church with a lofty tower. Pop. 2318, chiefly employed in maling.

KHAFALUN, a town of Tibet, at the junction of the Shayuk and Leh, 90 miles N.W. of Leh. Pop. about 12,000.

KHALKAS, one of the principal races of Mongolia, inhabiting the regions on the southern frontier of Siberia. See **MONGOLIA**.

KHANDESH, in Hindustan, a British collectorate of the presidency of Bombay, bounded on the N. by the territory of Holkar, on the E. and S. by portions of the Nizam's dominions, and on the W. by Guzerat. It is situated between N. Lat. 21. 22., and has an area of 9311 square miles. This district may be described as a valley or basin traversed by the River Taptee, which flows from E. to W., and flanked on the N. by the Sautpoora range of mountains, on the S. by the range on which are the fort of Chandore and the ghaut of Adjunta, and on the S.W. by the Syadree range. On the S.E. the boundary surface is but slightly elevated. According to the census of 1851, the population of Khandesh amounts to 778,112. Khandesh was governed in the beginning of the fifteenth century by independent sovereigns, who, claiming descent from the Khalif Omar, resided at Aseerghur; but, towards the close of the sixteenth century, it was subdued by Akbar, and annexed to the Mogul empire. Shah Jehan, in 1634, made a new arrangement, adding some districts to Candesh, and constituting the whole a sobbah or province of his empire. During the contests for power and dominion between the families of the Mahratta chiefs Holkar and Scindia at the commencement of the present century, Khandesh was reduced to the state of a desert; and, on the final overthrow of the Peishwa, in 1818, it was annexed to the British dominions. The Bheel chiefs, trusting to their mountainous and jungly recesses, for some time continued refractory. They were dislodged from many of their retreats by the vigilance of British officers, who were long engaged in this harassing warfare; but in 1825 it was determined to adopt a more conciliatory line of conduct, and the province, in a short time, was restored to a state of perfect tranquillity. The district was combined with that of Ahmednuggur until 1849, when it was detached and formed into a separate zillah.

KHANIA, or **CANEA** (*Cydonia*), the chief commercial town of Candia, and capital of a sanjak of the same name, is situated on the N.W. coast of the island, surrounded by a fertile and beautiful country. It is well built and strongly fortified, and has the best harbour in the island. The principal exports are oil, soap, wax, silk, fruit, &c. Soap is extensively manufactured. Pop. about 8000, the majority of whom are Mohammedans.

KHARKOV, or **CHARKOV**, a government in the S. of European Russia, lying between N. Lat. 48. 30. and 51. 20., and E. Long. 34. 20. and 38. 20. It is bounded N. by the government of Noursk, E. by Voronez, S. by Ekaterinoslav, and W. by Poltava. Area, 20,900 square miles. The surface is generally flat, and not much wooded. The soil is very fertile, and in ordinary years about one-fourth of the quantity of corn produced is exported. Flax, hemp, tobacco, hops, and potatoes, are also grown. Bees are abundant, and cattle-rearing receives a considerable degree of attention. The principal rivers are the Donetz and Oskol, neither of which is navigable. With the exception of distilleries, which are numerous, the industrial establishments are few and unimportant, the principal being tanyards, saltpetre-works, and tallow-melting houses. Pop. (1851) 1,366,188.

KHARKOV, the capital of the above province, is situated at the confluence of the Kharkov and Lopan, in N. Lat. 49. 59., E. Long. 36. 26. The town is composed of narrow and crooked streets of wooden houses. The ramparts by which it was formerly surrounded have been converted into gardens and public promenades. It is the seat of the provincial courts, and has a cathedral, university, ecclesiastical seminary, military academy, and other educational institutions. The university (founded in 1803) had, in 1854, 75 professors, and 457 students. It has a library of 25,000 volumes, a botanical garden, and a museum. Kharkov carries on a considerable trade, and has four great annual fairs. Pop. (1851) 24,933.

KHARTOOM, the capital of the Egyptian province of Beled-es-Sudan, is situated on the W. bank of the Bahr-el-Azrek, or Blue River, about 1½ mile from its junction with the Bahr-el-Abiad, or White River. At the beginning of the present century only a few huts occupied the site of the present town; but when, in 1822, this territory became an Egyptian province, Khartoom was fixed upon as the seat of government. Being favourably situated near the junction of two large rivers, and near the great caravan route from Darfur and Kordofan, it carries on a very extensive trade. The White River brings into it, from the most distant parts of the country, ivory, ostrich-feathers, gum, &c.; while gold, coffee, senna, and tamarinds, are brought by the Blue River. These articles, as well as slaves, are thence conveyed to Cairo, the Red Sea, and Mediterranean. Pop. estimated at about 20,000.

KHATMANDU. See **CATMANDOO**.

KHERSON, a government in the S. of European Russia, on the N. shore of the Black Sea, between N. Lat. 46. 10. and 49., and E. Long. 29. 20. and 34. It is bounded N. by the governments of Kiev and Poltava, E. by Ekaterinoslav and Taurida, S. by the Black Sea, and W. by Bessarabia and Podolia. It is about 250 miles in length from E. to W. by 180 miles in breadth, and has an area of 28,280 square miles. With the exception of the S.W. part, where are some of the last ramifications of the Carpathians, and a hilly portion in the N.E., the government consists almost entirely of an immense steppe, destitute of trees, but covered with long grass. In the S.W. and N.E. parts there are considerable forests. The Dniester flows along a great part of its W. border, and the Dnieper along its E. The principal of its other rivers is the Bug, which flows southward through the territory, dividing it into two not very unequal parts. The climate is very variable, and characterized by extremes both of heat and cold. Agriculture is but little attended to, the country being much better adapted for pasturage. The sheep are numerous, and of a superior breed. Among the horned cattle, buffaloes are common. Wild animals are abundant, especially wolves and wild cats. Flax, hemp, tobacco, saffron, and liquorice, are cultivated. Several varieties of the vine are cultivated, and wine of an inferior quality is made. The fisheries are important, both on the sea-coast and in the rivers. Its

Kharkov
||
Khereson.

Kherson commerce, carried on at Odessa and Kherson, is very extensive. Pop. (1851) 889,205.

||
Khiva.

Kherson, the capital of the above province, is situated on the right bank of the Dnieper, 90 miles E.N.E. of Odessa. It was founded in 1778, and fortified in 1780, and soon rose to be a place of importance; but the want of sufficient depth of water for large vessels, and the rise of Odessa with superior advantages for trade, led to its decline. It is divided into four parts—the citadel, the admiralty, and the Greek and military suburbs. The first contains the different government offices, cathedral, arsenal, barracks, and prison. In the admiralty quarter are extensive docks, building-yards, and storehouses, but these are now little used. The trade of the town is inconsiderable, with the exception of that in timber. Howard, the philanthropist, died here in 1790; and over his grave, about 3 miles N. of the town, is an obelisk erected by the Emperor Alexander. Pop. (1851) 24,338.

Khiva, a kingdom or khanat of Turkistan in Asia, bounded on the N. by Ust-urt and the Sea of Aral, N.E. by the Desert of Kizil Koum, E. by Bokhara, S. by Merve and Persia, and W. by the Caspian Sea. Its extent is variously estimated at 150,000 to 450,000 square miles. It is for the most part a series of arid steppes broken by oases of various magnitude. Of these, the most important—constituting the khanat properly so called—is a narrow tract lying on the W. bank of the Oxus (now called the Amou Deria, or Jihun), along the lower part of its course. It is in length about 150 miles, and in area about 4000 square miles, watered by innumerable canals, carefully cultivated, and thickly inhabited. The climate of Khiva is dry, and, on the whole, healthy, though the extremes of summer heat and winter cold are considerable. The clearness of the sky is specially remarkable. The soil is naturally arid, but irrigation and manure have rendered it very productive. Among the principal vegetable products are wheat, barley, rice, millet, cotton, the mulberry, vine, apple and apricot, peas, lentils, melons, potatoes, &c. The country generally is destitute of wood, but the region on the E. side of the Oxus produces forest trees. The Sheik-Djeli, a range of hills running parallel to the Oxus, between Lat. 42. 20. and 40. 35., are said to contain gold and copper, but these minerals are not worked. Limestone, salt, and sulphur, are found in quantities sufficient for economic use. The numbers of the population are very variously estimated—by some authorities at 200,000, by others at 2,000,000. Slavery is general; and the power of the khan is absolute. The capital, Khiva, is a collection of low mud houses, containing from 5000 to 10,000 inhabitants. The manufactures and commerce of the country are inconsiderable, the stationary population being chiefly occupied in agriculture; while the Turkomans live, for the most part, by cattle-breeding and plunder. Some cotton, woollen, and silk stuffs, earthenware, &c., are made and exported; about 2000 camels' loads of agricultural produce, silk, &c., are annually sent to Orenburg, Astrakhan, and Cabul. The chief trade is with Russia and Bokhara, and none but Mohammedans are allowed to traffic within the khanat. The Khivans are of the Sunnite persuasion—one great cause of enmity between them and the Persians.

Khiva is part of the ancient Chorasmia, or Kharazm; which, after owning the sovereignty of China and Persia, was an independent kingdom from the tenth to the thirteenth century. In 1221 it was conquered by Genghis Khan, from whose descendant it was wrested by Timur in 1379. Early in the sixteenth century it was overrun, with the rest of Turkistan, by the Uzbeks, the race which has continued dominant there to this day. Their language is the Turkish. Nearly equal to them in numbers are the Tanjiks or Sarts, a Persian race, said to be the original inhabitants. The nomadic tribes are the Turkomans or

Trukmans, the Karakalpaks, and the Kirghiz. Of these, the Turkomans are the least subordinate to the khan. They rear large herds of horses (prized for their beauty), cattle, and sheep, but are still fonder of plunder and kidnapping. The number of Russian subjects detained as captives in Khiva moved the Czar, in 1839, to send an expedition against the khan. The difficulties of the march prevented it from reaching its destination, but since then the Russians have been permitted to erect forts on the line of their caravan route into the territories of the khan. The extension of their frontier in this direction is probably only a matter of time.

KHOI, a walled town of Persia, province of Azerbaijan, on a tributary of the Kar, 15 miles N. of Lake Urumiah. It is situated in a very fertile district, and is described as one of the best built towns in the Persian empire. The streets are wide and regular; and are shaded by rows of trees. Khoi carries on a considerable trade between Turkey and Persia. In the plain of Khoi, Shah Ismael signally defeated the Turks under Selim I., in 1514. Pop. about 15,000.

KHOJEND, a town of Independent Turkistan, Central Asia, and Khanat of Khokan, on the Jaxartes, 90 miles W. of Khokan. It is surrounded by walls and wet-ditches, and intersected by canals. It manufactures coarse cotton goods, and carries on a considerable trade in these, and Russian merchandise. Caravans entering the Khanat from Bokhara pay toll at Khojend.

KHOKAN, **KOKAN**, or **FERGHANA**, a khanat of Independent Turkistan, Central Asia, between N. Lat. 40. and 45., and E. Long. 67. and 75.; bounded N. by the Kirghiz Steppe, E. and S.E. by Chinese Turkistan, S. by Bokhara and the tableland of Pamere, and W. by the Kara-kalpak territory. It is for the most part mountainous, comprising part of that lofty region which forms the W. wall of the great plateau of E. Asia. The principal river is the Jaxartes or Syr, which flows at first westward, and afterwards northward, through the territory, dividing it into two nearly equal parts. The plains and valleys near the Jaxartes, or its tributary streams, are generally rich and fertile, while in other parts, the land is comparatively arid and sterile. Khokan is more of a pastoral than an agricultural territory, although there are many cultivated spots scattered over its surface. One of the chief productions of the country is silk, for which it has long been famous. Cotton is another of its staple productions. Corn, and the various fruits of Europe, especially grapes and melons, are grown. The hills are covered with pine, poplar, almond, walnut, pistachio, and other trees. Large flocks of sheep are pastured here, and wool constitutes an important article of export. The climate is one of extremes; in summer, heat is great and parching, and little rain falls till towards the end of harvest, while the winter is very severe, though there is not much snow. The mineral products are coal, iron, copper, jasper, lapis-lazuli, &c. The chief manufactures are silk and cotton stuffs. The inhabitants are mostly Uzbeks, who are shepherds; and a few Tanjiks, who live in villages, and are described as a stout, fair, and high-complexioned people; quiet and hospitable; and fond of the chase. There are also several wandering tribes of Kirghiz.

KHOKAN, the capital of the above khanat, is situated on the left bank of the Jaxartes, 230 miles N.E. of Samarcand, and about the same distance N.W. of Kashgar. It is an open town, the palace only being surrounded by a mud wall. The streets are unpaved and narrow, and the houses mostly of mud. It has numerous mosques, and several bazaars and caravansaries. The chief manufactures are silk and cotton stuffs; and the trade in cattle and silk is considerable. The vicinity is fertile and well cultivated. Pop. about 50,000.

KHOOLOOM, **KHULM**, or **TASH-KURGAN**, a town of Central Asia, khanat of Koondooz, on the Khooloom River,

Khoi

||
Khooloom.

Khorasan. a tributary of the Oxus, and on the high road between Balkh and Koondooz, 40 miles E. by S. of the former, and 68 W. by S. of the latter; N. Lat. 36. 38., E. Long. 68. It is surrounded by mud walls, and defended by two forts of the same material. Pop. about 10,000.

KHORASAN, or **KHORASSAN** (*Country of the Sun*), a province of Persia lying between N. Lat. 34 and 38, and E. Long. 53. and 61., and bounded on the N. by Khiva, E. by Afghanistan, S. by Yezd, and W. by Irak-Ajemi and Mazanderaun. Its boundaries, however, have varied much at different times. It has never been a great and independent empire; but frequently the loosely attached province of a dissolving state, and the scene of invasion, rebellion, and anarchy. It has formed a frequent subject of dispute between the independent monarchs whose territories lay on the E. and W.; and it was sometimes in the power of one and sometimes of the other. At one time it extended N. to the Oxus, including Kharazm and Balkh, E. to Candahar, S. to Kerman and Seistan, and W. to the districts of Ispahan, Cashan, and Rhe.

The surface of this province, like other parts of Persia, is much diversified by plains and mountains. A very large portion of it is quite unfit for the habitation of man, and consists of arid rocks, destitute of vegetation or fresh water, and deserts, either of salt land or sand, among which are to be found a few fertile oases. The Elburz range of mountains crosses the northern part of the province in an easterly direction, sending forth various ramifications to the southward. From the base of these mountains a desert of barren sand stretches northward to a great extent, including the steppe of Kharazm, and forming part of that immense plain which extends eastward as far as the Jaxartes and the Oxus. In this plain are many fertile districts, but in that portion of it belonging to Khorasan there is no permanent habitation, and its scanty population comprises only a few tribes of wandering Turkomans. At the foot of the mountains, however, are many fertile and well-watered valleys, which were formerly well-peopled and cultivated, and once contained several large towns, which are now deserted and in ruins, in consequence of the incessant attacks of the plundering Turkomans. To the S. the Elburz Mountains send forth ramifications which penetrate from 60 to 100 miles into the plain. Beyond this is the vast salt desert, which extends southward, with occasional fertile tracts, very nearly to the Persian Gulf. This desert varies very much in its nature in different parts. In some places the surface is dry, and even produces a few of those plants that thrive in a salt soil; in others it consists of a cracking crust of dry earth, covered with a saline efflorescence. There are extensive marshy tracts, in the lower parts of which water accumulates during the winter months, which is evaporated by the summer sun, leaving a quantity of salt in cakes, upon a bed of mud. In some places the soil is a hard-baked and perfectly barren clay. Again, in certain districts, extensive plains of sand are found, which is occasionally heaped up in hillocks in the form of waves, and frequently so light as to be raised aloft by the wind in clouds, under which travellers are frequently buried, as in the Arabian deserts. The saline desert, however, according to Fraser, predominates in Khorasan. It is of a considerably higher level than the desert to the N. of the Elburz Mountains; but still this traveller is of opinion that they are connected. The only fertile parts of Khorasan are where the country is penetrated by the Elburz Mountains; and in the N.E. corner of Khorasan there is a long stripe of country, consisting of the lower parts of these mountains, from 10 to 20 miles in breadth, which bear some inconsiderable traces of cultivation, and give shelter to a few miserable hamlets, but contain no village of any consequence. The valley of Meshed, amongst the Elburz Mountains, is of great length. It commences 10 or 12

miles to the N.W. of Sheerwan, extends without interruption for 50 miles beyond Meshed, and continues for the greater part of the way to Herat. It varies from 12 to 30 miles in breadth, and contains in its extent, beside the city of Meshed, the towns of Chinnaran, Radcan, Koukan, Sheerwan, and their dependencies, with a great extent of cultivated land. The road from Meshed to Herat also passes through several well-peopled and well-cultivated districts. The extensive valley here spoken of contains a considerable portion of the district known by the appellation of Kurdistan, being inhabited by Kurdish colonies. The cultivated parts of the province produce wheat, rice, tobacco, cotton, hemp, assafoetida, and most of the fruits of Southern Europe. The rearing of cattle is the chief employment of the nomad tribes that roam over the desert. The camels and goats of Khorasan are celebrated for their fine soft hair, which is a valuable article of trade. The chief towns are Meshed or Mushed, and Nishapoor.

KHOSRU, or **KROSREW** I., called *Chosroes* by the Greeks, and surnamed *Anushirwan*, "generous spirit," succeeded his father, Cobades or Kobad, as King of Persia, A.D. 531, and reigned with great glory and success till 579. He is justly entitled to be looked upon as one of the greatest of all the kings of Persia. As a warrior he proved himself able to cope with the best armies and most skillful generals of Rome. So terrible was his name, even to that warlike people, that the emperors were glad to purchase peace by the payment of a heavy annual tribute. He carried his conquests eastwards to the Indus, and northwards to the Oxus. Native historians dwell with pride on the embassies that came from the distant kingdoms of Africa, India, China, and Tibet, to solicit his friendship and gain his good will with valuable gifts. Feared abroad, he was respected and beloved at home, and the Persians look back upon his reign as the golden age of their history. His virtues, and more especially his justice, dwell in their memories. Science, literature, trade, and agriculture found in him a sure and constant patron. Academies and libraries were founded in the chief cities of his kingdom; and the masterpieces of Sanscrit, Greek, Latin, and Hindoo learning were, by his orders, translated into the Persian tongue. Among other translations which he caused to be made may be mentioned that of the *Indian Fables* of Pilpay, from which the versions in most of the European tongues have been taken. Among his countrymen Khosru holds a place analogous to that held by Alfred among Englishmen, or by Charlemagne among the Franks. (For the details of his life and reign, see **PERSIA**.)

KHURD-CABUL, a village of Afghanistan, situate in a pleasant valley, 16 miles S.E. of Cabul, and 7466 feet above the sea-level. Here, in 1841, the British troops, retreating from Cabul to Jelalabad, became totally disorganized, and were murdered without resistance by the Afghans; and here, in 1842, General Pollock encamped after the decisive defeat of the Afghans at Tezeen.

KHUZISTAN, a province in the west of Persia, lying between N. Lat. 30. and 33., and E. Long. 47. and 51; and bounded on the N. by Luristan, E. by Fars, S. by the Persian Gulf, and W. by Asiatic Turkey. It is about 200 miles in length from N.W. to S.E., and 140 in breadth. The southern part of the province consists of vast sandy plains and morasses wholly destitute of vegetation. The shores of the gulf are in winter a swamp, and in summer a parched desert. Farther inland are some rich alluvial tracts, well adapted for cultivation. The N. and E. parts of the province are mountainous, with many beautiful and fertile valleys. The rivers Tigris and Euphrates form its western boundary. The principal of its other rivers are the Kerah, the Karun, and the Jerahi. Wheat, barley, rice, dates, indigo, cotton, and tobacco are produced. The chief towns are Shuster and Dizful.

Khyrpoor
||
Kiangsee.

KHYRPOOR, a town of Hindustan, in the province of Scinde, consisting of a collection of mud hovels, with a few houses of better description scattered about. The population is estimated at 15,000 souls. Khyrpoor is the principal place of the district of the same name. When Scinde was subjugated by the British, a large measure of favour was extended to one of the Khyrpoor Ameers, Ali Murad, on the ground of his early and consistent adherence to the cause of the conquerors, and it was proposed to confirm him, not only in his patrimonial lands, but also in others which had passed into his possession by virtue of a treaty executed in 1842, when he vanquished his brother and nephew, and obtained certain cessions as the price of farther forbearance. The extent of these cessions was open to question, but Ali Murad having persuaded Sir Charles Napier to adopt that view which best promoted his interest, was admitted to all he claimed. Suspicion, however, was never altogether lulled; and subsequent inquiry proved the Ameer's claim to rest on fraud and forgery. The treaty had been written, according to Mohammedan custom, upon a leaf of the Koran, and the extent of territory transferred being very small, Ali Murad, by interpolating some words, contrived to convey to himself considerable districts, in place of small villages. Fearing, however, that some curious eye might detect the interpolation, he subsequently removed the leaf, and caused its place to be occupied by another, bearing record to the like effect. This was established before a British commission on the 5th January 1853, and on evidence which could not be doubted. Only one result could reasonably follow, and Ali Murad was of necessity deprived of his ill-gotten acquisitions, which were incorporated with the rest of Scinde, as part of the British empire in India. He was, however, permitted to retain the lands allotted to him by his father, an act, not of justice, but of liberality. Since his connection with the British government, Ali Murad has abolished slavery within his territory. Khyrpoor is about 13 miles S.W. of Roree, the road from which place is good. Lat. 27. 3., Long. 68. 48.

KI, or **KEY ISLANDS**, a group in the Indian Archipelago, between Lat. 5. 6., Long. 132. 133. The principal islands are Great Ki, Little Ki, and Ki Watela. The first is about 50 miles long, and rises into mountains covered with forests. On the W. of Little Ki, which is level, is the large harbour of Doola, where shipbuilding and some trade with the Banda and Celebes Islands are carried on. The principal exports are provisions and cattle. The inhabitants are mostly Mohammedans, and are said to be somewhat civilized.

KIACHTI, or **KIACHTA**, a town of Siberia, government of Irkutsk, on the Kiachta, a small affluent of the Selenga, 180 miles S.E. of Irkutsk. Kiachti is situated close to the Chinese frontier, and is the great emporium of trade between Russia and China. It consists of an upper and lower town; the former contains the public offices, barracks, &c.—the latter, about 2 miles farther S., is inhabited chiefly by merchants. On the Chinese side, and within a mile of the lower town, is the Chinese village of Mai-Maitchin with which the chief traffic of Kiachti is carried on. A great fair is held annually between the two places in December. The Russians exchange furs, leather, broad cloths, coarse linens, bullion, glass, cattle, &c., for tea, manufactured silks and cottons, china-ware, rhubarb, toys, and other Chinese produce. In 1843 the Russians imported through Kiachti, 102,700 chests of tea; and the value of woollen and cotton goods, leather and furs, received by the Chinese merchants in that year amounted to above L.677,200. This, however, is about double the amount of trade in ordinary years—the great increase being occasioned by the English war with China. Pop. about 5000.

KIANGSEE, a province of China, to the N. of Canton, surrounded on the E. and S. by mountains, and traversed

by the Kan-Kiang, which, in the N of the province, forms the Po-yang-hu Lake. The valley of the Kan-Kiang is a highly productive region. The porcelain of this province is of the first quality; it is manufactured on an immense scale at King-te-ching, a large town to the N.E. of Lake Poyang. Capital, Nan-Cang-foo. Pop. 33,000,000. Area, 72,000 square miles.

KIANG-SU, a maritime province of China, bounded E. by the Yellow Sea, S.W., N.W., and N., by Tche-Kiang, Nganhoei, Honan, and Shantung. Area, 44,500 square miles. It is one of the most fertile provinces in China, and possesses unusual facilities for commerce, being traversed by the great rivers Hoang-ho, and Yang-tse-Kiang, and from S.E. to N.W. by the Imperial Canal. The surface is mostly level, and a great portion of the coast is protected by dikes from the incursion of the sea. Marshes and lakes are numerous; of the latter, which abound in fish, the largest are the Hong-tse-hu, the Kan-yu-hu, and the Tai-hu. The chief products of the province are silk, cotton, tea, rice, &c., of which large quantities are exported. The principal cities are Nankin, Shang-hai, Yang-tchu-fu, and Su-tchu-fu. Pop. above 38,000,000.

KIDDERMINSTER, a market-town and municipal and parliamentary borough of Worcestershire, on the Stour, near its junction with the Severn, 13 miles N. of Worcester. It is irregularly built, and most of the houses are small, but the streets are well paved and lighted. The best building in the town is the parish church, a fine old structure in the perpendicular style, with a tower. There is a free grammar school, with a revenue of about L.580, but indifferently attended. The total number of pupils at all the schools is about 1000; there are three literary institutions. Kidderminster has been celebrated for more than a century for its carpets, in the manufacture of which extensive improvements have been introduced within the last few years. Bombazeens, waistcoatings and damask, and silk goods are also made here. There are some tanneries, breweries, &c. The Stafford and Worcester Canal, and the Oxford, Worcester, and Wolverhampton Railway pass by the town. It returns one member to parliament. Constituency in 1856, 511. Pop. 18,462. Kidderminster was at one time the property of the poet Waller, and enjoyed for many years the pastoral ministrations of Richard Baxter.

KIDDERPORE, in the British district, called the Twenty-four Pergunnahs (Bengal Presidency), a small town almost adjoining Calcutta, of which it may be regarded as a suburb. It is described by Heber as a large village, in the vicinity of which are several considerable houses inhabited by Europeans, and considered to be remarkably dry and salubrious. There is here a dockyard formerly belonging to Mr James Kyd, but now the property of government. A factory has recently been erected, and thus the means are concentrated within the dock establishment for the efficient repair of the government steamers. Distance from Fort William, S.E. 4 miles. Lat. 22. 30, Long. 88. 22.

KIDWELLY, a small but ancient seaport-town of Caermarthenshire, South Wales, on the Gwendraeth-Vechan, 9 miles S. of Caermarthen. It has a fine old church and Norman castle, both partially in ruins; the latter overlooks the town from a rocky height on the W. of the river. The trade of the place is trifling. Pop. of parish 1648, chiefly employed in smelting iron and tin.

KIEFF, **KIEV**, **KIEW**, or **KIOW**, a government of European Russia, bounded N. by Minsk, E. by Tchernigov and Poltava, S. by Kherson, S.W. and W. by Podolia and Volhynia; area 19,000 square miles. The general surface is flat or undulating, with some low ranges parallel to the river courses. The principal river is the Dnieper, which divides the province from Tchernigov and Poltava about 250 miles of its course. Its chief tributaries are the Pripetz, Testerev, Irpen, Stugena, Ros, and Tiasmin. The climate is remark-

Kiang-Su
||
Kieff.

Kieff
||
Kiel.

ably temperate, though the summer heat is often extreme. The population, amounting in 1850 to 1,638,000, are chiefly occupied in agriculture and cattle-breeding. The peasants are mostly serfs. The vegetable productions include grain of all kinds, hemp, flax, and tobacco. Excellent timber grows extensively in the north. The cattle are large and of good breed, and are fattened in great numbers for exportation. The manufactures are unimportant, the most extensive being that of beetroot sugar. Trade is chiefly in the hands of the Jews, who are numerous.

KIEFF, the capital of the above government, is picturesquely situate on several eminences on the right bank of the Dnieper, 650 miles S. of St Petersburg. It consists of three different towns—the Old Town, the Petscherskoi, or New Fort, and the Podole, or Low Town—each separately fortified, but all surrounded by a common intrenchment. The old town is built on a steep hill, separated from the Petscherskoi by a ravine. This was the ancient residence of the grand dukes of Kieff, and contains the cathedral of St Sophia, founded in 1037 by Jaroslav Vladimirovitch, whose marble tomb is within the archiepiscopal palace, and the convent of St Michael. The Petschersk, or citadel, occupies a still higher eminence to the S. of the old town. It is very strongly fortified, and contains a large arsenal, the residences of the civil and military governors, and the famous monastery of Petscherskoi, said to have been founded by St Anthony in the ninth century. The chief object of interest within the walls of the monastery is the church of the Assumption, which is magnificently decorated internally, and is surmounted by a belfry 304 feet high, surrounded by seven turrets with gilt cupolas connected by gilded chains. In the catacombs are preserved the bodies of upwards of 100 Russian saints. This monastery is yearly visited by thousands of pilgrims. The Podole, or Low Town, which occupies the level between the hills and the river, is the largest, but least picturesque portion of the city, and is the residence of the middle classes and trading population. It is regularly built, with wide streets interspersed with trees, and contains an imperial palace, an ecclesiastical academy (founded 1661, and very largely attended), and an exchange, with a hall capable of accommodating 3000 persons. A magnificent suspension-bridge connects it with the opposite bank of the Dnieper, which sometimes overflows the lower part of the town.

Kieff is the seat of the governor-general of Little Russia, and of the Archbishop of Kieff and Galitz. The university of St Vladimir, founded in 1833, has a large library, museum, and observatory, and, in 1846, had about 80 professors and 600 students. The principal manufactures are earthenware and leather. There is a large trade with Odessa and the interior, and the great annual fair in January draws visitors from all parts of Europe. Pop. about 50,000.

This city is of unknown antiquity. In the ninth century it became the seat of the power founded by the Varangian Rurik. Here Christianity first found a footing among the Muscovite barbarians. In the eleventh and twelfth centuries it was the capital of the empire. After many reverses, and successive occupations by Poles, Lithuanians, and Tartars, it was finally ceded to Russia in 1686.

KIEL, a seaport of Denmark, capital of the duchy of Holstein, is finely situated on a narrow peninsula surrounded on three sides by the Kielerfiord, a lake-like arm of the Baltic, 54 miles N. of Hamburg. It is well built and walled, and the environs and wooded banks of the bay afford numerous picturesque views of the surrounding country and the sea. The principal public buildings are the Glücksborg palace—the church of St Nicholas, an ancient edifice with a lofty tower—the university, and the convent church. Kiel is the seat of the Schleswig-Holstein State Assembly; and has a university, founded in 1665, with a large library, museum, botanic garden, and observatory. The excellence

Kil
||
Kildare.

of its harbour, which affords safe anchorage near the town for the largest ships, and its position in the line of communication between the Baltic and German Ocean (by the Kiel Canal), have raised Kiel into commercial importance. In a political point of view, as the only great military haven on the S. coast of the Baltic, it is of still greater importance. A railway communicates with Altona and Hamburg, with branches to Rendsborg and Glücksborg, and steamers ply regularly to all the principal Baltic ports. The chief manufactures are sugar, soap, tobacco, ironmongery, hats, &c. Among the chief articles of trade are sprats and red herrings. Pop., including the suburbs, about 15,000.

KIL, a geographical prefix, said to be derived from a Dutch word, signifying a stream. It is, however, more probably the corruption of a Celtic word, meaning a grave. It occurs chiefly in Scotch and Irish names, as Kilcreggan, Kilkenny.

KILBARCHAN, a small town of Renfrewshire, 11 miles W. of Glasgow. Pop. 2467, principally employed in weaving tartans, &c., for Glasgow and Paisley.

KILBIRNIE, a small town of Ayrshire, on the Garnock, 17 miles S.W. of Glasgow. Pop. 3399, employed in cotton spinning and weaving, flax-spinning, bleaching, rope-making, and iron-smelting and founding.

KILCREGGAN, a watering-place on the Clyde, coast of Argyleshire, between Gare Loch and Loch Long, 24 miles W. of Glasgow.

KILDA, St (originally HERR), the farthest west of the Scottish Hebrides, is a small and rocky island in the Atlantic, above 100 miles W. of the Butt of Lewis, in N. Lat. 57. 50., W. Long. 8. 35. It consists of an irregular mountain ridge, about 3 miles long by 2 in breadth, and, with the neighbouring islets, presents from the sea an outline singularly varied and picturesque. The highest point, Conachan, is 1450 feet above the sea, and on its western side descends almost perpendicularly to the water. With the exception of a fine bay on the N.E. side, and a smaller opening on the S.W., the coast of the island presents a nearly uninterrupted front of lofty precipices, broken in some places into fantastic peaks, in others hollowed into enormous caves. At the head of the eastern bay, which is well sheltered by the rocky promontories on each side, is the small village, consisting of about 30 houses, to which the population is confined. The inhabitants, in number about 100, are a simple, kind, and active race. They cultivate as much land as is requisite to provide a moderate supply of barley and oats; but their main employment is the capture of the wild-fowls, which from February to October cover the rocks in myriads. The birds mostly caught are the solan goose, the fulmar (or greater puffin), and the common puffin. Of these a supply is salted for winter provision: the feathers, in which principally the rent is paid, are preserved and exported once a-year. The annual visit of the factor affords the only regular means of communication with the rest of the world. Despite their lonely condition, the dangers of their occupation, and their frequent privations in respect of fuel and food, the inhabitants of St Kilda are much attached to their native rock, and very few cases of migration have ever occurred. Most of their infants die of a peculiar malady, which attacks them generally on the eighth day after birth. They have enjoyed since 1705 the services of a resident clergyman, who is at once schoolmaster, pastor, and patriarch of the island. A diminutive breed of ponies was at one time reared in considerable numbers; it is now all but extinct. The native cows are small, but yield excellent milk; the sheep, which number about 2000, are mostly of Danish breed, small, and generally of a dun colour. The surrounding waters abound with fish, but the inhabitants confine their exertions to dry land. (See Martin's *St Kilda*, and Wilson's *Voyage*.)

KILDARE, an inland county in the province of Leinster, in Ireland, is bounded on the N. by the county of

Kildare. Meath, on the E. by those of Dublin and Wicklow, on the S. by that of Carlow, and on the W. by the King's and Queen's counties and Westmeath. With the exception of a small tract of hilly land, situated between Naas and Blessington, on the eastern side of the county, Kildare presents an unusually flat surface, few portions of which reach an elevation of 300 feet above the level of the sea. This county contains altogether about 52,000 acres of uncultivated land, of which 44,000 acres consist of extensive flow bogs, being a part of the Great Bog of Allen. It has been well ascertained that bogs of this description are susceptible of cultivation, both for corn and green crops, when perfectly drained, and covered with clay and limestone gravel, which occurs abundantly along the bog edges; but it is impossible, without great exertion, and the expenditure of considerable capital, to coat the surface of the bog with gravel at a greater distance from the edge than half an English mile. It appears probable that not more than one-third of those bogs are capable of being improved for cultivation, but that the whole may be drained at a moderate expense, and thereby rendered, to a certain degree, profitable, not only for pasture, but for fuel. Including the bogs and hilly pasture, this county contains about 16,000 acres capable of improvement for cultivation; 31,000 acres may be drained for coarse pasture; and 5000 acres which would not repay the expense of draining. According to the Ordnance Survey Kildare comprises a total area of 418,436 acres, of which 356,786 are arable, 51,854 uncultivated land, 8288 are in plantations, 490 occupied by towns and villages, and 1017 under water. The annual value, according to Griffith's *Valuation*, is L.313,494.

Some writers, in the time of Ptolemy, assert that the Eblani were the inhabitants of this county; others, amongst whom is Whitaker, make it the habitation of the Coriundi. Afterwards it formed part of the territory of Cealan or Galen, which likewise extended over some parts of Wicklow and Carlow. Its present name is derived from Chille or Kill Dara, the forest or church of oaks, the country being formerly covered with trees. The principal family in this district, previously to the arrival of the English, was that of the O'Kellys, whose residence was at the Moat of Ardscull, near Athy. On the death of Dermot M'Murrough, the last king of Leinster, which occurred shortly after the settlement of the English, this county formed part of the palatinate of Leinster, granted by Henry II. to Strongbow. When this extensive inheritance was distributed into five portions, amongst the daughters of William, Earl Marshal, who derived from Strongbow, by intermarriage, through his only daughter, Kildare fell to the lot of Sybilla, the fourth daughter, who married William de Ferrers, Earl of Derby, from whom it descended by marriage to the family of De Vesci, and thence by attainder to that of the Fitzgeralds or Geraldines. The principal families which held under Strongbow and his descendants were those of De Hereford, Fitzhenry, Phepoe, Pippard, D'Angulo or Nangle, and Bermingham. The Fitzgeralds ultimately became possessed of the greater portion. It was one of the twelve counties into which King John, on his arrival as lord of Ireland, divided that part of the island which acknowledged the English jurisdiction, but was not finally separated from the adjoining county of Dublin, to which it had been attached as a liberty, until the close of the reign of Edward I., when it was empowered to have sheriffs and courts of its own. The county is now divided into the fourteen baronies of Carbery, Clane, Connell, Ikeathy, Kilcullen, Kilkea and Moone, North and South Naas, East and West Narragh, East and West Offaley, and North and South Salt. These baronies are subdivided into 116 parishes.

According to the ecclesiastical arrangements, the county is partly in the diocese of Kildare, and partly in that of Dublin. Kildare diocese extends also into the King's and

Queen's counties. The bishopric was founded in the sixth century by St Conleth, who was buried near the great altar of his own church. The bishop took precedence of every other except Meath; all the rest ranking according to the dates of consecration. The episcopal income was latterly extremely small, amounting only to L.520 a-year; neither was there any episcopal residence, so that, in order to supply the deficiency of his revenue, the bishops of Kildare held the deanery of Christ Church *in commendam*. The city of Kildare is a small, poor place, wholly unworthy of notice, except from the circumstance of being the seat of the bishopric, and from the cathedral, and some monastic remains still existing. In accordance with the provisions of the Church Temporalities Act, on the decease of the late bishop the see of Kildare was united to the archbishopric of Dublin.

By much the greater part of the county is flat, interrupted only by a range of low hills in the centre, the most northern of which is the Hill of Allen, and the southern those of Dunmurry: the land on the eastern boundary, toward Dublin and Wicklow counties, gradually rises as it approaches the adjoining mountain tracts. The Boyne rises in a bog or marshy ground to the N. of Carbury, a branch of the Great Bog of Allen. The Lesser Barrow also rises in the Bog of Allen, and unites with the Greater Barrow near Rathangan. The Grees and Lane are small branches of this latter river, joining it near the southern extremity of the county. The Barrow forms the western boundary of the county, except in the neighbourhood of Athy, where it becomes navigable, and is known by the name of the Barrow Navigation. The Liffey enters the county from the W. near Ballymore-Eustace; and after sweeping through it, at first in a western and then in a northern direction, by Kilkullen Bridge, Clane, and Celbridge, receiving in its course the Morrel and the Rye-water, it quits the county at Leixlip. Numerous lesser streams, rising in the more elevated tracts, fall into one or other of these rivers. A great part of the Bog of Allen lies in the northern part of the county. This bog is not an interrupted morass, but is intersected in many places by elevated tracts of firm ground, the largest of which, lying in its southern part, has obtained the name of the Island of Allen, in consequence of its being surrounded by an unproductive and half fluid mass. To the S. of the town of Kildare is a tract of undulating ground, covered with fine sward, of a vivid green, uninterrupted by any plantation, and well known as the Curragh of Kildare. It extends nearly five miles in a south-eastern direction, having an average breadth of a mile, and containing 8000 acres. It is wholly the property of the crown, and has been long used principally as a sheep walk, for which it is peculiarly adapted, from the quality of its herbage and the dry elastic nature of its soil. The pasturage is held by the farmers of the surrounding lands, who pay large rents for the exclusive privilege of grazing sheep on it, in numbers proportioned to the quantity of land without it limits. The most celebrated race-course in Ireland is on the Curragh. The softness and elasticity of the turf render it peculiarly suitable for this sport. It is the chief race-course in Ireland, and perhaps the finest in the empire. Races are held here twice a-year, in April and September. During the late war with Russia the Curragh was occupied by a camp, and is now the quarters of a military division, consisting of a cavalry and two infantry brigades. The climate of Kildare is moister than most other parts of the great limestone plain of Ireland. The soil of the county is generally a rich heavy loam, on a bottom of limestone or limestone gravel, except in some insulated spots in the hilly districts. Copper ore is said to have been found in the central hills; but, either from deficiency of quality or quantity, or from a still more marked deficiency of fuel, none is now raised.

Kildare. The Hill of Allen, a steep conical elevation, rising to about 300 feet in height, and situated on the S.W. of the cultivated tract of land surrounded with bog and denominated the Island of Allen, consists of a fine-grained gritstone of which mill-stones are made.

The population was as follows, according to the authorities stated beneath, at the respective dates :—

1760.....	De Burgo.....	51,726
1772.....	Beaufort.....	56,000
1812.....	Parliamentary return	85,133
1821.....	Ditto.....	99,065
1831.....	Ditto.....	108,424
1841.....	Ditto	114,488
1851.....	Ditto.....	95,688

This population was represented in the Irish parliament by ten members—two for the county, and two for each of the boroughs of Athy, Kildare, Naas, and Harristown. All these boroughs were deprived of the right of returning members by the Act of Union; and as no change has since been made, the representation is at present confined to the two county members.

The number of children receiving instruction in public schools, according to returns made under parliamentary authority in 1824-26, was 8857.

Of this number 1425 were of the Established church, 7276 were Catholics, 31 Dissenters; the religious persuasion of the remaining 125 was unascertained. The number of schools was 214, of which 25, containing 1623 pupils, were maintained by grants of public money; 29, containing 1707 pupils, by voluntary contributions; the remaining 160 schools, containing 5527 pupils, were wholly supported by the fees paid by the parents or guardians of those receiving instruction.

In 1851 the number of schools in the county, and pupils attending them, was ascertained by the Census Commissioners to have been as follows :—

Schools.	No. of Schools.	No. of Pupils.		
		Males.	Females.	Total.

Kildare.

The lands are very unequally portioned out. There are a few large estates. That of the Duke of Leinster extends over nearly one-third of the county. Many farmers hold large tracts; many others scarcely sufficient for the sustenance of a family, there being about 7000 holdings of less than 30 acres in extent. The general average of farms is about 17 acres. The larger farms are well cultivated according to the most approved systems, though not with all the neatness and precision which mark the operations of the English agriculturists. The small farmers manage their land in a slovenly manner, and with a persevering attachment to the customs of their forefathers. Wheat is grown in large quantities, the strong loam being well adapted for it. The lands not subjected to the plough are very rich, fattening grounds; but when exhausted by injudicious courses of cropping, the pasture is poor and light.

The crops grown on the land, and the extent of land under cultivation since 1847, is shown in the following table :—

Years.	Corn, Beans, and Pease.				Other Crops.				Flax.	Meadow and Clover.	Total extent under Crops.
	Wheat.	Oats.	Barley, Bere, Rye, Beans, and Pease.	Total.	Potatoes.	Turnips.	Green Crops.	Total.

2. Under one year.....	12,354	9,057
Total of pigs.....	15,993	12,112

The dwellings of the middling farmers generally consist of a long building of a single storey, the lower part formed of stone and mortar, the upper of clay thatched with straw, and divided in the inside into a kitchen and two sleeping rooms, one at each end. In the front is a yard or hawse enclosed at each side by the stables, barn, and cow-houses,

Kildare. and used as a repository for all the manure collected from the dwelling-house and offices, and from the feeding of the cattle. The habitations of the labourers or cottiers are very wretched, particularly those living in or near the edges of the bogs. The cabin is sunk beneath the surface of the soil, in order to diminish the quantity of wall to be built. The roof, thatched with sods of turf pared off the surface of the bog, is but a few feet above the ground, and assimilates so closely with the appearance of the surrounding fields as to be nearly imperceptible at a short distance, except from the smoke rising out of its openings, or the ingress and egress of children or domestic animals through the hole in the side intended for a door. The food of the peasantry is potatoes, with some milk and butter occasionally. The use of flesh meat is little known, except on a few high holidays. The fuel is universally turf, which may be said to be the only thing the poor man here has in plenty. The clothes of the peasantry are made of home-manufactured frieze, or cheap cottons.

Manufactures can scarcely be said to exist here. That of cotton was attempted, without success, at Prosperous, near Clane, where the first cotton-mill in Ireland was erected. An extensive woollen factory has been for several years at work near Celbridge, and still continues to produce large quantities of the coarser woollen cloths. Paper is also manufactured in some places, and tanning is carried on to a considerable extent. The county affords many fine sites for water-mills. The beautiful falls of the Liffey, at the Salmon-leap, near Leixlip, offer a perennial command of water adequate to move very extensive machinery. Many other falls are to be met with on the same river in its course through the county. The locks of the canals also could supply water for many lesser works. The Grand Canal enters the county from the Dublin side, at Hazelhatch, 8 miles from the harbour at Portobello, and passes through it in a south-western direction to Sallins, where there is a short branch to the town of Naas. The main trunk proceeds in a western direction to Lowtown, at which place it divides into two branches; the one, proceeding westward to the Shannon, near Banagher, quits the county at Edenderry; the other, which takes a more southern direction, joins the Barrow at Monasterevan, the western bank of which river it follows as far as Athy, where it ceases, the river navigation from that point to the sea being deemed sufficient for the purposes of inland navigation. The summit-level, commencing at the distance of 7 miles from Dublin, and extending 4 miles, is 264 feet above the level of the sea at high water. The Royal Canal, which skirts the northern boundary of Kildare, enters the county at Leixlip, and proceeding by Maynooth, Kilcock, and Cloncurry, quits it for the county of Meath at the Boyne. Both these carry to Dublin large quantities of turf, bricks, stone, flags, slate, grain of every description, and potatoes.

The remains of antiquity in the county are numerous. There are five round or pillar towers. That at Kildare is said to be the most perfect in Ireland; it is 130 feet high. At Taghadoo there is another 71 feet high. The third, at Kilcullen, has only 40 feet standing. The fourth, at Oughterard, has suffered still more severely from the ravages of time; its height is but 25 feet. The fifth, which stands in the churchyard at Castledermot, is used as a belfry, and by a casual spectator might be mistaken for the trunk of a lofty tree, in consequence of its being enveloped with a covering of ivy from its base to its summit. Several of the upright stones, supposed to be relics of the worship of Baal, are also to be seen. One at Punch's Town stands 20 feet above the ground; another, with a conical top, is at Harristown; two others, situated at Jigginstown, are known by the name of the Long Stones; another, called the Gobhlan, is near the Hill of Carmen or Mullamast, where is also to be seen a large rath, situate on the summit of a hill of some

elevation, near which are sixteen smaller raths or hillocks. **Kildare.** These are said to have been the seats of the elders when the assembly of the states of Southern Leinster, under the name of Naasteighan, was held on this eminence. At a later period it became more memorable from a tragedy acted upon it by some of the English settlers, who, having invited the neighbouring Irish chieftains to a conference there, for the amicable settlement of their disputes as to territorial boundaries, fell upon them unexpectedly, and slaughtered them to a man. The pit into which the heads of the victims of this murderous act of treachery were flung is still shown; and the place thence acquired its name of Mullamast, or the Hill of Decapitation. The other raths of most note are those of Ard-cull, near Naas, where the English, under Hammoh le Gros, were totally defeated by the Scots, under Edward Bruce, in 1315; and that of Rheban, to the N. of the same town. Others are still to be seen at Naas, Kilkea, Moone, Clane, and Lyons, and at Rath-sallagh. The Abbey of Kildare is one of the oldest in Ireland. It is said to have been founded by St Brigit, and was the place where the sacred fire was kept, which, after being extinguished by Henry de Loundres, Archbishop of Dublin, in 1220, was again lighted and kept burning till the Reformation. The ruins of the building in which it was kept still exist. Castle Dermot had also three great monasteries. A parliament was held in one of them in the year 1499. Naas had an Augustinian and a Dominican abbey. The site of the fine abbey of Monasterevan is occupied by Moore Abbey, the residence of the Marquis of Drogheda. Of that of St Woolstan's, near Celbridge, nothing now remains but two towers and gateways. At old Kilcullen, the site of the monastery is marked by some curious stone crosses. The principal castles are those of Kilkea, built by the seventh Earl of Kildare, lately restored, and now the residence of the Marquis of Kildare; those of Athy and Castle Dermot were built by the eighth Earl of Kildare. Timolin Castle was erected in the reign of King John, by the Lord of Norragh. Rheban, on the Barrow, gave the title of baron to the family of St Michael. The castles of Narraghmore and Harristown also gave baronial titles to their possessors. Amongst the modern seats the most remarkable are—Carton, near the town of Maynooth the princely residence of the Duke of Leinster; Castletown, one of the largest and finest Italian mansions in Ireland, the seat of the Conolly family; Killadoon, that of Lord Leitrim, in the same neighbourhood; Lyons, on the banks of the canal, the splendid mansion and demesne of Lord Cloncurry; Straffan, on the Liffey, between Celbridge and Clane, the residence of Mr Barton; Belan, near Timolin, once the seat of the Earls of Aldborough; and Palmerston, the Earl of Mayo's. At Jigginstown, near Naas, are still to be seen the walls of a large mansion commenced by the unfortunate Earl of Strafford, whilst lord-lieutenant under Charles I., but never finished.

There is no large town in the county. The population of neither of the assize towns amounts to 5000 souls. That of Athy, the larger, was, in 1851, 3908; and of Naas, 3132 souls. The former of these towns is situate on the banks of the Barrow, which is here crossed by a bridge, and owes much of its small population to its being the point of connection between the still-water navigation of the Grand Canal, which terminates here, and the river navigation of the Barrow to Ross and Waterford. It was incorporated by James I., under the care of a sovereign, two bailiffs, and twelve burgesses. The assizes are held here once a-year; and its old castle has been converted into a prison. Naas, pleasantly situated on the Liffey, in the centre of a very fertile and well-cultivated tract of country, and communicating with the main trunk of the Grand Canal by a connecting branch, carries on a considerable retail trade. Maynooth is remarkable for several castellated ruins, built at

Kilimand-
jaro
||
Kilkenny.

various times by members of the Fitzgerald family; and for being the site of the Roman Catholic college, founded for the education of the priesthood, and supported by an annual parliamentary grant. (H. S.—E.)

KILIMANDJARO, the highest mountain in Africa (with the doubtful exception of Kenia), is in the Djagga country, W.N.W. from Mombaz, S. Lat. 3. 40., E. Long. 36., about 250 miles from the coast. It is crowned with perpetual snow: estimated height, 20,000 feet. It was discovered in April 1848 by Dr Krapf, a missionary.

KILKENNY, an inland county, in the province of Leinster, in Ireland, is bounded on the N. by the Queen's county, on the E. by the counties of Carlow and Wexford, on the S. by the county of Waterford, and on the W. by that of Tipperary. According to the Ordnance Survey, the total area of the county is 509,732 acres; of which 470,102 are arable, 21,126 uncultivated land, 13,899 in plantations, 1549 occupied by towns and villages, and 3056 are under water. Of the 21,000 acres of coarse pasture or uncultivated land, it is calculated that about 7500 acres may be improved for cultivation, 6000 for pasture by draining, and 7500 acres may be considered as unimprovable.

According to Ptolemy, the county was inhabited by the Brigantes and the Caucoi. It afterwards formed part of the kingdom of Ossory, which was sometimes tributary to Leinster, sometimes to Munster. After the arrival of the English, it formed one of the counties into which King John divided that portion of the island which recognised his supremacy. At the termination of the sixteenth century it was chiefly occupied by the Graces, the O'Brenans, the Butlers, the O'Sheas, the Rooths, the Harpurs, the Walshes of the mountains, the Shortals, and the Forstals. It is now divided into the ten baronies of Callan, Crannagh, Fassadinin, Galmoy, Gowran, Ida, Iverk, Kells, Knocktopher, and Shillelogher; besides which, the county of the city of Kilkenny forms a separate jurisdiction. These baronies are subdivided into 140 parishes.

The parish of Durrow, forming an insulated portion surrounded by the Queen's county, was made part of the county of Kilkenny by an act of parliament, obtained through the influence of the Duke of Ormond. His object was to repress the outrages committed on his tenantry by the Fitzpatrick's, who inhabited that district, and who, when tried in the Queen's county, which belonged to their own sept, were always acquitted, but when tried in Kilkenny, the Duke's county, were sure to be convicted.

According to the ecclesiastical arrangements of the country, Kilkenny is chiefly comprehended within the diocese of Ossory, which extends over 120 of its parishes; the remainder are in the diocese of Leighlin. The see of Ossory was first planted at Seikyrán, near Birr, about the year 402; thence it was removed to Aghaboe, in the Queen's county, about 1052; and finally to Kilkenny, in the latter end of the reign of Henry II. Like Meath, it derives its name, not from the seat of the episcopal see, but from that of the district over which it extends. Besides nearly the whole part of the county of Kilkenny, the diocese also comprehends the entire barony of Upper Ossory, forming one-third of the Queen's county, and a small part of the King's county. The dean of the cathedral exercises a kind of episcopal jurisdiction over the vicars-choral, similar to that of the dean of St Patrick's, Dublin; and the archdeacon formerly exercised an ordinary prescriptive jurisdiction over the whole diocese. The annual value of the see was estimated at L.3859 by the parliamentary return made in 1833. In conformity with the provisions of the Church Temporalities Act, this diocese has been united to the dioceses of Leighlin and Ferns.

The surface of the county is mostly level in the central baronies, but hilly in the northern, and still more so in the south-eastern districts. Very little ground is unfit for tillage,

and that which is not productive of good grain throws up excellent herbage. The soil in the northern parts is chiefly a mossy turf a few inches deep, lying over a bed of stiff yellow or whitish clay. More southerly, the soil is light, covering an argillaceous schistus. To the W. there is a hungry clayey loam, over a bed of limestone. In general, the nearer the limestone is to the surface, the poorer the soil. A light soil covers all the vicinity of the city of Kilkenny, exhibiting the appearance of slaty hills and gravelly bottoms. Proceeding southwards, the fertility increases. The angle of the River Suir, which forms the parish of Portnascully, is the richest land in the county. The quantity of bog is inconsiderable, amounting altogether to 3500 acres; the largest tract is in the north-western extremity. Marl has been found between two strata of black turf mould; three strata of bog have also been discovered, separated by intervening beds of marl, oak, and fir; willow and birch have been found in the bogs. There are no loughs of any extent. In the parish of Cloghmanta there are some temporary lakes, produced by the water bursting up from the ground in November, and subsiding in spring. They are here named Loughans; in Connaught they are called Turloughs. The climate is less humid than that of Dublin or Wicklow.

The principal rivers are the Nore, the Barrow, and the Suir; all of which rise in the range of the Slieve Bloom Mountains, and, taking a southern direction, discharge themselves by a common mouth into the estuary at Waterford. The Nore rises at the eastern base of the Devil's Bit Mountains, in the county of Tipperary, passes through the middle of this county, and by the city of Kilkenny. It is navigable for boats as far as Thomastown, and unites with the Barrow about 2 miles above Ross, in the county of Wexford. The salmon-peal, a fish resembling the salmon, is caught in this river. The King's River joins the Nore at Jerpoint, and the Argula, near Innistioge. The Barrow forms the eastern boundary of the country from near New Bridge to its junction with the Suir, which latter river is its boundary to the S. The Barrow is navigable for boats along the whole extent of the borders of the county of Kilkenny; and still farther, to Athy, in Kildare county. The Suir is navigable for sloops to Carrick, and for barges to Clonmel, in Tipperary.

The substrata of this county are granite, clay-slate, limestone, and sandstone. The granite hills form a very small part, being merely the extension of the Wicklow group. The rock is of various shades, but the best is of a light yellow tint, finely grained, and compact; black mica is found in it, together with specks of iron ore. In the western part of the county there is an extensive slate quarry, highly esteemed.

The collieries of Castlecomer, the most extensively worked of any in Ireland, are situated near the confluence of the small rivers Dinan, Dian, Bruckagh, and Cloghoge, which join the Nore. They were discovered by accident, in working for iron ore. The depth of the beds varies from 2 feet 6 inches to 3 feet 1 inch. The workings extend over a tract of about 8 miles in length, and all the coal of the district is of that variety termed anthracite. It burns without flame or smoke, but, on account of its sulphureous exhalation, is unfit for domestic use. The excellent qualities of the Kilkenny coal for particular purposes occasion a great demand for it. It is heavy, burning with little flame, like charcoal in an ignited state, and throwing out a steady and violent heat. It dries malt well, and is excellent for the forge. The coal sill, or seat of the coal, which is sometimes raised with it, is a soft, black, brittle shale, full of shining impressions, exhibiting obscure traces of the stems of gramineæ. It enters into the composition of excellent crucibles, which resist the strongest heat, as the more they are exposed to the fire, the harder they become. Fire-bricks are made from two parts of it and one part of clay. When analyzed, 100 grains appeared to contain 61 per cent. of silice, 36

Kilkenny. of argil, the remaining 3 grains were carbon and calcareous earth, with an almost imperceptible quantity of iron, being nearly identical in composition with pure Stourbridge clay when dried. It seems peculiarly calculated for cementing steel, and for potteries; but it has not been applied to either purpose, although materials for earthenware are to be found in the neighbourhood, and iron-mines of the best quality occur in upper strata of entire hills. Yellow ochre is found in various places; also pipe-clay of good quality. Manganese is seen on the banks of the Barrow, and near Freshford, and lead in small quantities between Innistioige and Ross; a mine of the latter at Floodhall was worked for some time with considerable profit. Iron has also been raised. Jasper has been found near the extremity of the granite district, between the Nore and Barrow. Limestone is the base of the central part of the county; but the quality varies much in different places, all the varieties of it containing impressions of shells or corallines. The most important limestone quarry is that which produces the Kilkenny marble; it lies about half a mile from the city. The marble, when polished, presents a black ground, curiously varied with madrepora, bivalve, and other organic impressions, which appear more strongly when exposed to the air; but that approaching nearest to unmixed black is most esteemed. The blocks when raised, are finished at a marble-mill at some distance, remarkable for the ingenuity and simplicity of its mechanism. The marble is used for chimney-pieces all over the county, and in some other parts of Ireland.

At Ballyspellan, in Galmoy barony, is a very celebrated mineral spring. It is a chalybeate, and contains carbonic acid gas, which soon evaporates on exposure to the air. Its medicinal qualities have long been highly esteemed in the neighbouring country. Chalybeate springs, but not of much strength, exist in other places. This county also abounds with springs of very pure transparent water, most of them dedicated to some saint, whose patron-day is annually celebrated on their verge.

The census of population, taken at different periods, presents the following results:—

1760	De Burgo,	62,832	1831	Census,	169,945
1792	Beaufort,	100,000	1841	Ditto,	183,349
1812	Census,	134,664	1851	Ditto,	138,779
1821	Ditto,	158,716			

Exclusive of 20,000 inhabitants in the city of Kilkenny.

The parliamentary returns of the number of children receiving education in the public schools, in the years 1821, and 1824–26, give the following results:—

	Boys.	Girls.	Sex not ascertained.	Total.
1821	10,191	4420	...	14,511
1824–26	12,398	7000	274	19,672

Out of the total number of children, according to the latter of these returns, upwards of 18,000 were Catholics; the Protestants amounting only to 1376, of which number

but 13 were dissenters. The number of schools maintained by public money was 19, in which 1515 pupils were instructed; of those maintained by private subscriptions, the number was the same, the pupils in them being 1281: all the other schools, 346 in number, in which 16,876 children were instructed, were maintained wholly by the fees of the pupils. The number of schools, and of pupils attending them, in 1851 was ascertained to be—

Schools.	No. of Schools.	No. of Children.

The county returned 16 members to the Irish parliament—2 for the county at large, 2 for the city of Kilkenny, 2 for the adjoining borough of Irishtown, and 2 each for the boroughs of Callan, Gowran, Innistioige, Knocktopher, and Thomastown. All these, except Kilkenny, were close boroughs, the elective franchise being vested in the burghesses, whose number seldom exceeded 20, and who were elected through the influence of the proprietor of the land.

Very little land in the county is unfit for tillage; the central parts are peculiarly adapted for wheat, to the growth of which the best ground, most of which has a limestone substratum, is devoted. The more mountainous tracts are exclusively appropriated to oats or pasture. Wheat is sown either on a fallow or after potatoes. Wheat here suffers from what is called the red or yellow worm; but as often this disease appears only in dry seasons, when the crop is better and more abundant, the evil is not extensive. Barley is usually sown after wheat. The extent of land under each description of crop, and the total extent in cultivation since 1847, is stated in the agricultural returns collected by the Irish government to have been as follows:—

Years.	No. of Holdings above 1 acre.	Corn, Beans, and Pease.				Other Crops.				Flax.	Meadow and Clover.	Total extent under crops.
		Wheat.	Oats.	Barley, Bere, Rye, Beans, and Pease.	Total.	Potatoes.	Turnips.	Green Crops.	Total.

Kilkenny.

The use of green food for cattle is not so general as might be desired. Many of the cattle graze out during the winter; some are housed from Christmas to April. The only green food used in winter is furze-tops pounded, on which the cattle soon become sleek and fine skinned; for this purpose the large French furze is preferred. Little attention is paid to improve the pasturages. The mountain pastures are left in a state of nature, and the land produces little but heath. Much land on the borders of the Nore and Suir is embanked and used for meadowing. The most considerable dairies are in the Walsh Mountains; a name supposed to

be derived from the family to which a large tract of land Kilkenny. formerly belonged.

Few horses are bred in the county, most are brought in from Munster to the fair of Callan, the most esteemed fair for this description of stock. The common stock of black cattle is a cross of the Irish breed on the long-horned English. The Kerry cow is much in demand in dairies, for its low price and quantity of milk. The breed of sheep has improved very much. The number of holdings above one acre, and the quantity of live stock in the county since 1847, is shown in the following table:—

Year.	No. of Holdings above 1 acre.	Horses.			Mules.	Asses.	Cattle.			Sheep.		Pigs.		Goats.	Poultry.
		2 Years old, and upwards.	1 Year old, and under 2.	Under 1 Year.			2 Years old and upwards.	1 Year old, and under 2.	Under 1 Year.	1 Year old and upwards.	Under 1 Year.	1 Year old, and upwards.	Under 1 Year.

Bees were more attended to formerly than now, yet the soil and climate are well suited to them. The dry hills, covered with heath and scented herbs, produce honey celebrated for its flavour, and for the depth of its combs.

Within the last century, many parts of the county were covered with woods. Now there are but few, not covering more than 2000 acres. Attempts to raise plantations from the seed have not been successful; the seeds in this mild climate being liable to destruction from vermin. Orchards are much neglected. There are some ozieries on the banks of the Nore and Suir.

The woollen manufacture was introduced by the Earl of Ormond in the early part of the fourteenth century. He brought over workmen from Flanders, whose manufacture is still to be seen in the castle of Kilkenny. James Duke of Ormond went to great expense to introduce the linen manufacture in the seventeenth century. Latterly an attempt was made to manufacture superfine broad cloths in the neighbourhood of Kilkenny, but it soon failed. Friezes and ratteens are still made; the women spin the wool. The manufacture of woollen cloth was succeeded by that of blankets, which is still carried on. The linen trade, after a continuance of 50 or 60 years, has so died away that not a vestige of it now remains, beyond the making of coarse linen and sacking for domestic use. Paper is manufactured in several places. The principal part of the grain raised in the county is sent to Dublin in the form of flour, malt, and meal, the manufacturing of which is another source of wealth.

The number of resident gentry is considerable. Amongst the mansions remarkable for splendour or for architectural beauty are—the castle of Kilkenny; Mount Juliet, the seat of the Earl of Carrick; Desart, an Italian structure, the seat of the Earl of Desart; Kilfane, that of Sir John Power, Bart.; Flood Hall, the residence of the head of the Flood family; Besborough, the seat of the Earl of Besborough; and Woodstock, the seat of the Right Hon. Wm. Frederick Tighe, which has the reputation of being one of the most beautiful domains in the south of Ireland. The mansion is large, and the woods very extensive, stretching for 2 miles along the right bank of the River Nore, and reaching to the summit of the bank, a height of 800 feet. The farm-houses are of stone, more generally cemented with clay than with mortar, the offices usually forming an irregular yard in front of the house. The people in the hilly parts, who

hold land at will, live in scattered villages. The usual food of the peasantry is potatoes, to which milk and salt are generally added, and occasionally a herring. Turf is the general fuel, except in the neighbourhood of the collieries, where coal is burned, or else culm made up in balls with one third of clay. The clothing of the peasantry is frieze, ratteen, and flannel.

Amongst the remains of antiquity may be noticed a circle formed of stones on the summit of Slieve Grian, "The Hill of the Sun," called also Tory Hill, on one of which is an inscription that has given rise to much controversy. There is another circular group of stones on the Hill of Cloghmanta, which signifies "The Rock of God." The most remarkable cromlech is at Kilmogue; its upper stone is 45 feet in circumference. The country people call it Lachan Schal, or "The Great Altar Stone." Near the Spa of Ballyspellon is a large stone, formerly supported by others; it is called Clogh-bannagh, or "The Stone of Blessing." Rathes are numerous, particularly in Galmoy and near the Nore. At Earlsrath are the remains of a very large fort enclosed by a fosse. A moat near Rathbeath is pointed out as the place where Heremon, son of Milesius, built his palace and was buried. There are five pillar towers in the county. One is in Kilkenny, close to, and almost forms part of the cathedral; it is 100 feet high, and 48 feet in circumference at the base: the others are at Tulloherin, Killee, Fertagh, and Aghaviller, of which last the lower part only remains. All are in the vicinity of places of worship. Besides the remains of monasteries in the city of Kilkenny, there are vestiges of some others, once of great note, particularly one at Jerpoint, about one mile from Thomastown, and one of the most interesting ecclesiastical ruins in Ireland, founded by Donough, King of Ossory, and affords a fine example of the mixed Anglo-Norman and English styles of architecture. Another at Graig was founded under the auspices of the Earl of Pembroke in 1212, for Cistercian monks, and is still a venerable and interesting ruin. The Dominicans had abbeys at Rosbercon, founded in 1267, and at Thomastown, five beautiful pointed arches of which still remain. The Carmelites had one at Knocktopher, and there was a nunnery at Kilculliheen.

The number of castles is very great; most of them consist of a single square tower, which formed the keep. Graney or Grandison Castle, in Iverk, is among the most celebrated, as having been the residence of Margaret Fitzgerald,

Kilkenny. the great Countess of Ormond; it is supposed to have been built by the eighth Earl of Ormond, Lord-Deputy of Ireland, in 1521, and was taken by the parliamentary forces, under Colonel Axtel. From the towers and walls which remain some idea can be formed of the importance of the place when entire and garrisoned as a fortress. King John built a castle at Tybrachny, where there are the remains of a Danish town.

KILKENNY CITY is situate on the River Nore, which divides it into two unequal portions, and nearly in the centre of the county. Its name is generally derived from Kilkenny, "The Church or Cell of St Canice;" though by some it is traced from the words Coil-ken-ui, "The Wooded Hill near the River." It formerly consisted of two separate jurisdictions,—the city of Kilkenny properly so called, and the borough of Irishtown, separated from each other by the small stream called the Breagh, a tributary of the Nore; but by the provisions of the Municipal Reform Act the two corporations were amalgamated. An English settlement was formed here shortly after the landing of Strongbow; a castle was also erected, and the seat of the see of Ossory removed thither. William, Lord Marshal, who married Strongbow's daughter, granted the town a charter of incorporation, which was confirmed by Gilbert, Earl of Clare. Elizabeth and James I. confirmed and enlarged its privileges. From the Anglo-Norman invasion in 1170, to the Parliamentary War in 1641, Kilkenny was one of the most important inland towns in Ireland. It was frequently the residence of the Lord-Lieutenant, and parliaments were sometimes held in it; amongst others, that which passed the celebrated statute of Kilkenny, which first notices the distinction of English by blood, and English by birth. During the wars of 1641, it was the place where the assembly of the confederate Catholics held their sittings; the room where they met is still shown. Cromwell afterwards took the city on terms highly honourable to its defenders, and subsequently held his high court of justice in it. The city is irregular, but presents a cheerful and busy aspect; the houses, built chiefly of stone, are large and respectable. "I found the city of Kilkenny," says Inglis, "a large, well-built, beautifully situated, and very interesting town. In fact, I scarcely know any town more interesting or more picturesque." The Nore, here a river of some breadth, though not navigable, is crossed by two modern bridges. On the two most elevated points of the united towns are the castle and the cathedral, the most marked and ornamental structures of both. The baronial castle, which is full of historic associations, comprehends the remains of the ancient fortress, combined with more modern buildings. It was built by Strongbow in the twelfth century, purchased by James, third Earl of Ormond, in 1391; it has ever since been the principal residence of the head of the Butler family. In 1399 he entertained Richard II. in it for fourteen days. King William dined here after the battle of the Boyne. The buildings now form the sides of a quadrangle, the large interior courtyard having been retained. Its principal apartments were the presence chamber, formed of a suite of rooms opening into one another, in the farthest of which was an elevated seat for the lord of the mansion; and the picture gallery, 150 feet in length, chiefly furnished with family portraits. Several of the rooms are hung with tapestry. The court-house is a large and elegant modern building, erected on the site of Grace's old castle, where the assizes used to be held. The *tholsel*, or city court, is also large, but unornamented; it contains several apartments, one of which is used as a library. The market, well stocked with provisions of every kind, is held in one of the divisions of its inferior area. There are barracks both for cavalry and infantry. The county jail is at a short distance from the city. The environs of the town are very beautiful. The Duke's Walk, or Mall, extends

upwards of a mile along the banks of the Nore. The corporation consists of a mayor and aldermen, and other subordinate officers, who have the management of an income, arising from rents, of about L.2000 per annum. The cathedral of St Canice is an extensive pile, on a commanding elevation, in Irishtown. It is cruciform, surmounted by a small tower, and of greater dimensions than any similar building in Ireland, except the cathedral of St Patrick in Dublin. In the north transept is a chapel used as the parish church, where also is a stone seat called the Chair of St Kevin. The choir and chancel are fitted up in a style of chaste simplicity. The aisle contains several sepulchral monuments; amongst them that of Pierce, eighth Earl of Ormond, and Margaret Fitzgerald, his wife. The burial-ground of the cathedral is entered by a flight of marble steps, and is planted with trees. The episcopal palace was originally erected in the time of Edward III., and was modernized and enlarged in 1735; it is now a commodious, though not a splendid residence. The church of St Mary is a spacious but plain structure. Several monastic institutions added much to the beauty and dignity of the city. The most ancient was the preceptory of St John, founded about 1211. The abbey church, remarkable for the singular structure of its windows, which procured it the name of "The Lanthorn of Kilkenny," has been converted into a parochial church under its old name. The extensive and noble ruins of the Dominican or Black Abbey, founded in 1225, have been repaired, and now form a Roman Catholic place of worship. The ruins of the Franciscan Abbey, situate on the banks of the Nore, are much admired. The grammar school, generally called the College, was founded by Pierce, Earl of Ormond, and re-endowed by the Duke of Ormond in 1684. James II. erected it into a royal college, but on his abdication it reverted to its former state, and is now a respectable place of elementary instruction, capable of accommodating eighty resident pupils. In it Dean Swift, Congreve, Farquhar, and Bishop Berkeley, acquired the rudiments of classical literature. Kilkenny has also a seminary for the education of students intended for the Roman Catholic priesthood. The city also contains several Roman Catholic chapels, the county gaol and infirmary, union workhouse, and district lunatic asylum. A neat range of buildings, called St James' Asylum, in the suburbs, was endowed in 1803 by Mr James Switzer, for the maintenance of twelve Protestant and eight Catholic widows. The population of the county and city of Kilkenny in 1851 was 19,973; of the city alone, 15,808. No other place in the county, except Callan (2368), contains more than 2000 inhabitants. (H. S.—R.)

KILLALA, a small seaport of Ireland, county Mayo, on a bay of the same name, 26 miles N.E. of Castlebar. Pop. 1446. It was formerly the seat of a bishopric, founded by St Patrick, united in 1607 to Achonry, and to Tuam in 1833. The cathedral, a small but venerable building, is now used as the parish church; near it is a remarkable round tower. A French force under General Humbert landed here in 1798, and held the town for a short time.

KILLALOE, a market-town and bishop's see of Ireland, county Clare, 12 miles N.E. of Limerick. It is finely situated, though poorly built, on the Shannon, which is crossed by an old bridge of 19 arches, connecting the town with the suburb of Ballina on the Tipperary side. The river is navigable by large steamers from Killaloe to Leitrim (129 miles), and there are docks and quays here a little above the bridge. Pop., including Ballina, 2230, chiefly employed in marble mills, slate quarries, and in works connected with the river navigation. The principal building in the town is the cathedral, an old cruciform edifice with a tower; near it is the stone-roofed cell of St Lua, first Bishop of Killaloe; and on a small island opposite the episcopal demesne, is another chapel still more ancient. This town was long the

Killala
Killaloe.

Killarney
||
Kilrush.

royal seat of the O'Briens; and at Kincora, on Lough Dearg, about a mile to the N., are pointed out some remains of the residence of Brian Boru. At Killaloe, in 1691, General Sarsfield intercepted the artillery of William III. on its way to Limerick. The diocese, which dates from the seventh century, includes 70 benefices. The episcopal income is L.3870.

KILLARNEY, a market-town of Ireland, county Kerry, is beautifully situate, about a mile from the water, on the eastern shore of the lower lake of Killarney, 44½ miles W.N.W. of Cork. It is for the most part well built of stone, with clean regular streets; and during the summer and autumn is greatly resorted to by tourists. Pop. 5964.

KILLARNEY, Lakes of. See **KERRY**.

KILMALLOCK, a town of Ireland, county of Limerick, on the Dublin and Cork Railway, 17 miles S. of Limerick. It is supposed to derive its name from St Molach, who founded an abbey here in the beginning of the seventh century. It became the chief town of the Desmonds, and rose to great importance and splendour. Previously to the Union it returned two members to the Irish parliament. The present town is little more than an assemblage of ruins, and has obtained the title of the Irish Baalbec. The ancient houses, occupied at one time by the great families of Limerick, are now the abodes of filth and wretchedness. Externally they are frequently little altered, and are generally ornamented with battlements, stone mouldings, and arched doorways. The Abbey church dedicated to St Peter and St Paul, consists of choir, nave, transept, and belfry. The choir is now used for Divine service. Of the Dominican friary, founded in 1291, only the roofless church and part of the cloisters remain. Two gates and part of the ancient walls still remain. Pop. 1074.

KILMARNOCK, a flourishing market-town and parliamentary and municipal burgh of Scotland, Ayrshire, at the confluence of the Kilmarnock Water and Irvine (over which there are here seven bridges), 19 miles S.W. of Glasgow by rail. Its general appearance is highly respectable. The principal streets are well built and spacious, containing several handsome public buildings. In the centre of the town is a cross, and a statue of Sir James Shaw. Among the public institutions are an excellent academy (with 360 pupils in 1851), a library, three literary institutes (497 members in 1851), with libraries and two reading-rooms. Kilmarnock was long the principal seat of the blue bonnet and striped night-cap manufacture. This is now quite surpassed in importance by the manufacture of carpets and worsted shawls. Boots and shoes, hosiery, machinery, &c., are also made to a considerable extent; and there are some large tanneries. The town is situate in the midst of a highly cultivated district, abounding in coal and freestone. A railway (the first public line opened in Scotland), connects it with the seaport of Troon, 9½ miles distant. The burgh is governed by a provost, 4 bailies, a treasurer, and 12 councillors, and returns one member to parliament in conjunction with Port-Glasgow, Dumbarton, Renfrew, and Rutherglen: constituency in 1856, 600, being about the half of the combined numbers. It has two newspapers and several printing presses. Here, in 1786, was printed the first edition of the poems of Burns. In the neighbourhood are the ruins of the castles of Dean and Craufurdland.

KILOGRAMME, KILOLITRE, and KILOMETRE. See **FRANCE**, § *Weights and Measures*.

KILRENNY, a municipal and parliamentary borough and seaport of Scotland, county of Fife, on the N.E. shore of the Frith of Forth, 9 miles S. by W. of St Andrews. It forms a contributory borough to St Andrews, but is otherwise a place of little importance. Pop. of borough (1851), 1862, chiefly engaged in fishing.

KILRUSH, a market-town and seaport of Ireland,

county Clare, pleasantly situate at the head of a small bay on the N. side of the Shannon estuary, 36 miles W. of Limerick. It is neatly built, with several good public buildings; has some linen and woollen manufactures; and exports considerable quantities of herring and other fish to Limerick. Peats from the neighbouring bogs are also exported in large quantities. The harbour, which is the first above the mouth of the Shannon, is well sheltered except from the S. wind. There is a good pier, and steamers ply regularly to Limerick. Pop. 4471. In the Island of Scattery, which protects the roadstead of Kilrush, are numerous ecclesiastical antiquities, among which is a round tower 120 feet high.

KILSYTH, a parish and burgh of barony in the county of Stirling, Scotland, interesting as the centre of a remarkable religious revival in 1742-3, and on a smaller scale in 1839. The town, 12 miles N.E. of Glasgow, is ill built, and not remarkably clean. Pop. 3949, chiefly employed in hand-loom weaving.

KILWINNING, a town and parish of Scotland, Ayrshire, on the Garnock, 26 miles S.W. of Glasgow by rail. The chief interest of the place is connected with its ruined abbey, originally one of the richest in Scotland. It was founded in 1107 by Hugh de Morville, Lord of Cunningham, and dedicated to St Winning, who lived on this spot in the eighth century, whence the name. The monks were of the Tyronensian order. The first Scottish mason-lodge was founded here by a band of foreign brethren who came to assist in the building of the abbey. Here also the practice of archery has been kept up since the close of the fifteenth century. Pop. 3265; the men principally employed in hand-loom weaving and in the neighbouring coal and iron mines; many of the women in needlework. There is railway communication with the port of Ardrossan, 5½ miles. Not far from the town is the magnificent residence of the Earl of Eglinton.

KIMBOLTON, a small town of Huntingdonshire, 11 miles W.S.W. of Huntingdon, with an ancient castle, the seat of the Dukes of Manchester, and residence of Catherine of Aragon after her divorce from Henry VIII.

KIMCHI, DAVID, an illustrious Jewish rabbi, was born at Narbonne about the end of the twelfth century, and died in Provence in 1240. His father, Joseph Kimchi, and his brother, Moses Kimchi, though decidedly inferior to him, were men of great note in their day as Hebrew scholars and commentators. Moses Kimchi is the author of the celebrated *Commentary on the Life of Ezra*, incorporated in the rabbinical bible of Venice, 1549; and of a *Hebrew Grammar* published in that city in 1624. David Kimchi, however, has always been regarded by the Jews with a much higher feeling of reverence than any other member of his gifted house. Their respect for him falls little short of superstition; and in matters of doubt or dispute his authority is looked upon by them as final. In the fierce controversy which broke out between the Jews of Spain and those of France as to the opinions of Maimonides, he was chosen to arbitrate between the disputants: and it was entirely through his wisdom and knowledge that the controversy was brought to a close in such a way that both parties were completely satisfied. His printed works, as highly esteemed now as when they were first given to the world, are,—a *Hebrew Grammar* entitled *Michlol*—i.e., "Perfection," Venice, 1545; Leyden, 1631, &c.: a *Lexicon* of Hebrew roots entitled *Sepher Sforasain*, Naples, 1490; Venice, 1592, &c. These works, which have been frequently reprinted, furnished Buxtorf with the materials of his *Lexicon and Thesaurus*. The Grammar, in particular, has served as a model for all the Hebrew Grammars that have appeared since it was written. Kimchi wrote commentaries on almost all the books of the Old Testament. Some of these have been often printed separately; and a

Kilsyth
||

Kinburn
||
Kincardineshire.

collective edition of them was published at Gotha in 1713, in 3 vols. 4to. Kimchi was an obstinate Jew, and cherished an implacable and furious hatred to the name of Christ, which often breaks out in his most abstract speculations. A *catalogue raisonné* of his works, which include a Talmudic dictionary, is given in *Wolf's Bibliotheca Hebraica*, Hamburg, 1715-33.

KINBURN, a fortress of Russia, very strongly situate on a small peninsula at the mouth of the Dnieper, on its W. side. Opposite to it is the fortress of Oczakoff: the two together entirely command the entrance of the river. Near Kinburn in 1787 the Russians under Suwaroff gained a signal victory over the Turks. On the 17th of October 1855, this fortress capitulated, after a heavy bombardment of several hours, to a combined British and French force under Admirals Stewart and Bruat.

KINCARDINE, a seaport and borough of barony, Perthshire, on the left bank of the Frith of Forth, 21 miles W.N.W. of Edinburgh. It is irregularly, but not ill built, and has a good quay and harbour, affording anchorage to ships of 300 to 400 tons. There is a considerable coasting trade, chiefly in coals; and shipbuilding is carried on to some extent. Pop. 2697.

KINCARDINESHIRE, or THE MEARNS, a maritime county of Scotland, bounded N. and N.W. by Aberdeenshire, S.W. and S. by Forfarshire, and E. by the German Ocean. Its form is that of an isosceles triangle, with the apex pointing N.E.; its greatest length from the mouth of the N. Esk to that of the Dee is 81 miles, breadth from Dunnottar to Mount Battock, 22 miles; area, 243,200 acres. It may be viewed as consisting of five natural divisions,—the Coast side, Garvock, the How (or Hollow) o' the Mearns, the Grampians, and Deeside. The first of these is the most productive portion of the county; the land S. of Stonehaven renting at from L.2 to L.4 per acre. From the Esk to Bervie the coast is for the most part low. From Bervie to Stonehaven (about 12 miles) it presents an almost unbroken range of perpendicular rock, from 100 to 250 feet high; thence to Aberdeen it is interrupted by creeks and bays. In this district are the towns of Bervie and Stonehaven, and the small ports of St Cyrus, Johnshaven, Gourdon, Katterline, Cratoun, Skateraw, Portlethen, Findon (or Finnan, whence "finnan-haddies"), and Cove. The district of Garvock rises to an elevation of from 250 to 750 feet above the sea, and is naturally bleak and unproductive, but the industry of the inhabitants has done much to reclaim it from sterility. Planting on a more extensive scale is still greatly to be desiderated. The How o' the Mearns is a continuation of the valley of Strathmore, and takes its rise a few miles W. of Stonehaven, extending S.W. for 16 miles, with an average breadth of 6 miles. The lower portions of this fine valley were originally marshes; and ague was common among the inhabitants. It has now entirely disappeared; the marshes having been thoroughly drained, and now yielding good crops of corn. The How is watered by numerous streams; the largest are the Bervie, Luther, and Fearn,—the first specially noted as a trouting stream. The general aspect of this district is highly flourishing, but the absence of hedge-rows, and the gradual removal of plantations, never very numerous, are defects that need remedy. Rising from this valley, and running parallel with it, is a ridge of the Grampians, which intersects the county from E. to W. This sterile region is about 8 miles in breadth, and embraces the area of nearly 80,000 acres, almost entirely occupied as sheep-walks. The highest point is Mount Battock (3500 feet), the summit of which forms the point of contact of Aberdeenshire, Angus, and Kincardine. The road from the How, over the steep romantic Cairn o' Mount, leads through Glen Dye into Deeside. This district begins with the valley of the Feugh, extends for about 10 miles on both banks of the Dee, and from the point where

that river begins to divide the county from Aberdeenshire, for about 13 miles on its right bank to the sea. The land of this tract is not in general of a strong quality, but in moist seasons produces good crops. It is here also to be lamented that the plantations which adorn the face of the country are rapidly disappearing.

Of the minerals in this county, the most useful is limestone, which used to be quarried near Laurencekirk. The prevailing rock in the N. of the county is granite, and on the coast gneiss. Porphyry, conglomerate, sandstone, whinstone, &c., occur in great variety. The climate has much improved within the last 40 years, principally owing, no doubt, to the great improvements in drainage; but the high bleak hills, which extend over so much of its surface, must always exercise a chilling influence on the soil. High winds are very prevalent, and do much injury to crops. The improvements in agriculture during the present century have been very great. Among the number of those specially entitled to record as improvers on a great scale, are the late Mr Barclay Allardyce of Ury, and Mr M'Tier of Durris. With these exceptions, and a few besides, most of the improvements throughout the county are due to the energy and skill of the tenantry. The county is well furnished with roads, and is traversed by the Scottish North-Eastern and the Aberdeen and Deeside railways. Its total acreage under tillage in 1856, was 100,889½; of which there were—in wheat, 6080; barley, 7079; oats, 28,165; potatoes, 2893½; turnips, 16,853¼; grass and hay, 37,915½. The total value of agricultural produce in 1855 was estimated at L.898,588; in 1807 it was estimated at L.515,679. The number of occupants in 1856 was 1392; of landowners, from 60 to 70, about half of whom have rentals varying from L.1000 to above L.8000. The number of resident proprietors is about 20. The valued rent of land in 1674 was L.6243, 9s.; in 1815, L.94,861; in 1856, L.158,789. The farms vary in size from 20 to 400 acres. The tendency to enlarging farms is making way, as in other parts of Scotland, to the extinction of an industrious and exemplary class of the population. Farm-steadings have been greatly improved, but the accommodation for farm-servants is still extremely defective. Improvement in the breeding of stock has not been much stimulated by any local associations for that purpose, the only agricultural society in the county being limited to the district of Fettercairn, where, however, it has been of considerable benefit. The total live-stock in 1856 was 61,399,—estimated value, L.414,000. The number of horses was 4206; milch cows, 6568; total cattle, 26,449; sheep, 27,894. Fifty years ago, the paupers were 1 in 50 of the population, the average sum for their support being L.1, 16s.; in 1855 they were 1 in 26, costing each, on an average, L.4, 10s.

There are few manufactures in the county; that of woollens is carried on at Stonehaven on a small scale. There are flax spinning-mills at Bervie, distilleries at Glen Ury and Fettercairn, and breweries at Stonehaven, Johnshaven, and Laurencekirk. The salmon and white fisheries are carried on to some extent along the coast. The county town is Stonehaven, pleasantly situated on the sea-coast, near the mouth of the Carron, 16 miles S. of Aberdeen. It has a small harbour, but little trade. Pop. 3240. Bervie, a small place of 878 inhabitants, is the only royal burgh in the county. It received its charter from David II. Laurencekirk was long famous for the manufacture of wooden snuff-boxes, in which it competes with Mauchline and Cumnock. Of the old county town, Kincardine, not a vestige remains. The county returns one M.P. (constituency 920); and Bervie is a contributory burgh to Montrose. The population of Kincardineshire in 1851 was 34,743. The number of persons employed as servants and farm-workers in 1856 was about 6000; 287 lived in "bothies." There

Kincardineshire.

King,
William.

are numerous ancient cairns, and traces of Roman camps in the county. Of old castles, the most remarkable is Dunnottar, near Stonehaven, the old seat of the Keiths, Earls Marischal. It stands on a high projecting rock, nearly surrounded by the waves, and was at one time a place of great strength. The Scottish Regalia were kept here in the time of the Commonwealth, and here, in the reign of James II., a large number of Nonconformist prisoners endured such atrocity of treatment as was hardly outmatched by the Black Hole of Calcutta. On the Hill of Garvock is pointed out the "Sheriff's Kettle," where Melville, sheriff of the Mearns, about 1420, was boiled in a cauldron by some of the neighbouring barons to whom he had become offensive. Of distinguished men born in Kincardineshire were John of Fordoun the historian, George Wishart, Robert Barclay the Quaker, Bishop Burnet, Dr John Arbuthnot, Dr James Beattie, Dr Thomas Reid, and Lord Monboddo.

KING, WILLIAM, D.D., author of a famous treatise on the *Origin of Evil*, was born at Antrim in 1650. Taking orders in 1674, he was, five years afterwards, promoted to the chancellorship of St Patrick's, Dublin. When the persecution of the Anglican clergy began under James II., King, though a rigid Protestant, warmly inculcated the duty of passive obedience. "It was only," in the words of Macaulay (*Hist.*, vol. iii., p. 222), "after he had been repeatedly imprisoned by the government, to which he was devotedly attached; after he had been insulted and threatened in his own choir by the soldiers; after he had been interdicted from burying in his own churchyard, and from preaching in his own pulpit; after he had narrowly escaped with his life from a musket-shot fired at him in the streets, that he began to think the Whig theory of government less unreasonable and unchristian than it had once appeared to him." Adopting the principles of the revolution, he gave them his earnest support; and his constancy was rewarded with the deanery of St Patrick's, and, three years later, with the see of Derry. In 1702 he became Archbishop of Dublin, and held that office till his death in 1729.

As an author, King ranks among the most learned and able men of the Irish Church. After peace had been restored to Great Britain by William of Orange, he published his *State of the Protestants of Ireland under the late King James' Government*, Lond., 4to; pronounced by Burnet to be a "history as truly as it is finely writ." A far higher effort, however, was his *Discourse on the Inventions of Men in the Worship of God*, the object of which was to reconcile the Presbyterians of Ireland to the Episcopal form of church government. But the greatest of all his works was his essay *On the Origin of Evil*, published in Latin at Dublin in 1702. In this essay, he advocated what is known as the *optimist* view, which, with differences on subordinate points, is that adopted by Augustin and Leibnitz. According to this view, King, in common with these great thinkers, attempts to reconcile the existence of evil within the government of a perfectly holy, good, and powerful being, by treating it as the necessary result of creature limitation. His work attracted great attention both at home and abroad. Among its assailants were Leibnitz, who, while holding the monoistic hypothesis, denied much of King's reasoning and many of his conclusions on minor points; and Bayle, the last and greatest defender of the dualistic hypothesis. King did not publish any reply to either of his assailants, but left notes of a defence, which, after his death, were given to the world by Edmund Law, Bishop of Carlisle, along with an English version of the *De origine Mali*. Of his other works may be mentioned his *Discourse on Predestination*, which has been edited, and with valuable annotations, by Archbishop Whately. King's personal character stood very high through life; and his correspondence with Swift shows him to have been a man of fine wit and great general accomplishment.

KINGS, BOOKS OF THE, canonical books of the Old Testament, embrace three portions of sacred history, viz., the reign of Solomon, the parallel histories of Judah and Israel in their divided state after his death, and the history of Judah till the beginning of the captivity. Originally they formed one book, and were first divided by the Seventy, by whom they are classed as III. and IV. Kings. This arrangement obtains in the Vulgate. The name of the book gives a very inadequate idea of its contents, unless the theocratic position of the Jewish monarchs be borne in mind, with all its anomalous relations to the prophetic power. There was present in the nation an element to be found in no other human society; and hence the peculiar lights and shadows of the recorded history. To realize this, it is only necessary to contrast the history of Jezebel in the land of the theocracy, as given by the sacred penman of this book, with that of her cousin Dido in the classic pages of Virgil. The unity of the book has been denied by few. Jeremiah is the only prophet who may be reasonably named as its author; and it is certain there is throughout a considerable resemblance to his style. In compiling the history the author refers to certain works not admitted into the canon, and not now extant. The nature of these books has occasioned considerable variety of opinion, but it seems probable that they were authentic and official documents publicly known and accessible to the nation. There are few commentaries on Kings. The most satisfactory is that by K. F. Keil, *Commentar über die Bücher der Könige*, 8vo, Moskau, 1846.

KING'S BENCH, COURT OF. See ENGLAND, § *Government and Laws*.

KING'S COUNTY, an inland county of the province of Leinster, in Ireland, is bounded on the N. by the county of Westmeath, on the E. by the county of Kildare, on the S. by the Queen's county and Tipperary, and on the W. by the counties of Tipperary, Galway, and Roscommon. According to the Ordnance Survey, it comprises an area of 772 square miles, or 493,985 acres; of which 337,256 are arable, 145,836 uncultivated, 8258 in plantations, 902 in towns, and 1733 under water.

In the earliest periods of Irish history this county formed part of the territory of Hy-Falgia, and was also known by the name of Hy-Laoighis, a denomination that comprehended also the Queen's county, Dublin, Kildare, and some other districts. The southern part of it afterwards obtained the name of Ely O'Carroll. It was also known by that of the kingdom of Offaly, and was confiscated to the crown in 1557, in the reign of Philip and Mary, during the administration of the Earl of Sussex, under the title of East and West Glenmallery. This large tract of country was then reduced into shire ground, and one portion was called the Queen's county, and the fort and town named Maryborough, in honour of Queen Mary; the western district was called the King's county; and the fort of Dangan, in honour of King Philip, was named Philipstown, and was originally the assize town, but has been superseded in favour of the more important town of Tullamore. The principal clans were formerly the O'Connors, the O'Carrolls, the M'Egans, the O'Delanys, and the O'Meaghers. These chiefs were very troublesome neighbours to the English Pale, and kept up constant skirmishes with the royal forces. The forfeitures consequent on the wars of 1641 and the revolution were extensive in this county, and the principal families attainted were the O'Carrolls, the Coghlanes, the Geohegans, and the Graces. The King's county is now divided into the twelve baronies of Ballyboy, Ballycowan, Ballybritt, Clonlisk, Coolestown, Eglis, Garrycastle, Geashill, Kilcoursey, Upper and Lower Philipstown, and Warrenstown. These are again subdivided into fifty-one parishes.

According to former ecclesiastical arrangements of Ireland, this county comprehended parts of the dioceses of Kildare, Meath, Killaloe, Ossory, and Clonfert; but under

Kings,
Books of
the
King's
County.

King's County. the new distribution of the dioceses it is comprehended in those of Dublin, Meath, Killaloe, and Ferns.

The surface of the country is for the most part level and uninteresting, the usual elevation being less than 300 feet above the level of the sea. The great field of flötz limestone, that forms so much of the soil of Ireland, spreads itself over all but its southern portion. Beds of foliated limestone, of a greenish hue and a large granular texture, adapted for various useful purposes, are found at Tullamore. In the S.E. the Slieve Bloom Mountains extend in a direction from N.E. to S.W. for 20 miles, forming the line of demarcation between the King's and Queen's counties. They are steep and craggy, and have but one opening by which they can be crossed, called the Gap of Glandine. They consist of a nucleus of clay, surrounded by sandstone, with tracts of irreclaimable bog at their base. Pure white clay, of a quartzose nature, is found in them. Croghan Hill, about 3 miles N. of Philipstown, one of the most fertile and elevated of the eminences in the northern extremity of the county, rises above the surrounding level to the height of about 500 feet, clothed with verdure to its summit. It is composed of trap and flötz limestone. On those parts of its surface the basis of which is lime, the soil is extremely barren; whilst on the other parts it is peculiarly fertile, producing, from time immemorial, good crops of oats and potatoes, without manure. The difference is so marked, that the line of junction of the two formations can be traced by the verdure on the surface. Another elevation of the country, but less remarkable than that of Croghan, is the Hill of Cloghan, between the River Brosna and the Slieve Bloom Mountains. Numerous and abundant springs gush from it on all sides. The minerals found here are iron in small quantities, manganese, ochre, chalk, and potters' clay. The only river that can strictly be considered as belonging to the county is the Brosna, which rises in the county of Westmeath, and discharges itself into the Shannon. This latter river forms a considerable part of the western boundary of the county. The Barrow is its boundary to the S.E., and the Boyne skirts a small portion of its north-eastern extremity. The Lesser Brosna, also a branch of the Shannon, divides the county from Tipperary. The only lake within the county is Lough Pallas, of inconsiderable dimensions. The divisional line which separates the Queen's county passes through the middle of Lough Annagh, the northern portion of which is therefore considered as belonging to the King's county. It is of inconsiderable size, not covering more than 315 acres.

The soil is in general either a deep moor or a shallow gravelly loam; the former is the more productive in dry seasons, the latter in moist. Limestone is abundant in most parts. The pastures, though not luxuriant, form good sheep walks; that on the more mountainous tracts has proved excellent for young cattle. In reclaimed bog, corn crops are some weeks later in ripening than elsewhere, although the natural vegetation is earlier than in the upland pastures. A considerable portion of the Great Bog of Allen is in this county, which altogether contains about 146,000 acres, consisting either of flow bogs or coarse pasture land. The extent of the bogs may amount to about 120,000 acres, of which about one-third is capable of improvement for cultivation, by a system of perfect draining, followed by a coating of from 3 to 4 inches of clayey gravel, which occurs abundantly near the edges of most of the bogs. On the whole, including the elevated pastures, 45,000 acres are susceptible of improvement for cultivation; 94,000 acres might be drained, and 7000 acres are not improvable so as to repay the outlay. The returns of the number of inhabitants at various periods are as follow:—

1760.....De Burgo,	45,618	1831.....Census,	144,225
1792.....Beaufort,	74,500	1841....."	146,857
1813.....Census,	113,226	1851....."	112,030
1821....."	181,088		

King's County.

The density of the population, which in 1841 was 190 persons to the square mile, had diminished in 1851 to 145 persons, being a decrease at the rate of 45 inhabitants on each square mile.

The proportion of Protestants to Catholics is about one to four; the number of Dissenters is inconsiderable.

The county was represented in the Irish parliament by six members—two for the county at large, and two for each of the boroughs of Philipstown and Banagher. The boroughs were deprived of the right of returning members at the Union; and as no change has since been made, the county is now represented by only two members.

The number of children receiving education in public schools was, in—

Date.	Boys.	Girls.	Sex unascertained.	Total.
1821.....	5531	2601	...	8,132
1824-26.....	5787	3929	423	10,139

Of the numbers stated in the latter return, 2064 were of the Established Church, 7959 Roman Catholics, 22 Dissenters, and 94 whose religious persuasion was not ascertained. The total number of schools was 254, thirty of which, containing 1854 pupils, were supported by grants of public money; 24, containing 1404 pupils, by voluntary subscriptions; and the remaining 200, containing 6881 pupils, were maintained by the fees of those instructed. In 1851 the number of schools and of pupils attending them was ascertained to be as follows:—

Schools.	No. of Schools.	No. of Children.		
		Males.	Females.	Total.

The crops usually raised are wheat, oats, barley, and potatoes. Green crops are very general; rye-grass is much encouraged for early feeding. Great attention is paid to the rearing of horses, in consequence of which the county can boast of a fine breed. The uplands and moors are chiefly employed in feeding young cattle and sheep. The wool of these latter is highly esteemed at Ballinasloe. In the northern baronies there are many dairies. Lime, and limestone gravel, either by itself or formed into a compost with the gatherings of the farm refuse, constitute the general manure. The gravel burned in heaps, with the parings of the moors, produces very heavy crops. The produce of wheat on good lands averages twelve barrels of 20 stones per Irish acre, and on some choice lands has amounted to seventeen barrels. The crops grown, and the amount of land in cultivation since 1847, according to the agricultural returns collected by the Irish government, was as follows:—

King's
County.King's

There is every reason to suppose that the greater portion of this county was once an uninterrupted forest. Wherever the timber is protected it grows up to great size and beauty. The parts bordering upon Tipperary are richly wooded. Alder is indigenous. The ash grown here is preferred to any other by the Dublin workmen. The bogs furnish an inexhaustible supply of fuel, not only from their own peculiar vegetation, but from the trunks and roots of trees raised from them, which produce a quick and lively fire. Notwithstanding the great prevalence of bog, the general surface of the land is of sufficient elevation to afford great facilities for conducting the superfluous moisture to the rivers which intersect the country in all directions. The fences are generally of white thorn, which thrives remarkably well here.

The condition of the peasantry, though more comfortable than in some other parts of Ireland, is, notwithstanding, low in comparison with that of the English of the same class. The houses are small and poor, mostly covered with thatch, and seldom weatherproof. Earthen walls and straw roofs are preferred by most, not only from habit, but as being warmer than stone and slate. Fuel is everywhere plentiful; the bogs furnishing an inexhaustible supply of excellent quality. The food, in general, is potatoes and oatmeal. The peasantry are industrious when excited by what they deem adequate remuneration.

The only manufactures carried on are those of wool and linen; but the quantities wrought are merely sufficient for the home consumption. The Grand Canal, which crosses the county from E. to W., affords a cheap and expeditious mode of conveying its superabundant produce to other parts. Breweries and distilleries absorb much of the grain raised in the county.

Remains of antiquity of very remote date are frequent. In the Slieve Bloom Mountains there is a large pyramid

of white stones, called the Temple of the Sun, or the White Obelisk. Of Danish raths, which are numerous, the most remarkable is that in Finglas parish. A chain of moats, chiefly situated at the passes of the bogs, may be traced throughout the county. At Clonmacnois are two round towers and several stone crosses. This sequestered spot was the site of several places of religious observance, whence its name of the Seven Churches. The monastery is said to have been founded by the O'Melaghins, princes of Meath; and the castle, the detached ruins of which form a most picturesque object, to have been erected in 1214. Clonmacnois was also a bishop's see, which merged in that of Meath in 1568. There were three religious houses at Killeigh. Monasteris Monastery, founded by one of the Bermingham family, in the district called Thotmoy, was a place of great repute. Durrow was also the site of an extensive abbey. The remains of military antiquities are still more numerous. Rathmore Castle, the area of which comprehended two acres, is looked upon as the oldest in the county. At Banagher are the remains of a fortress which commanded an important pass over the Shannon. Birr or Parsonstown Castle, formerly the residence of the O'Carrolls, having become the property of the Parsons family, is now the residence of Lord Rosse, and is well known as containing the most powerful reflecting telescope in existence. Cangor Castle, in Clonlisk barony, is noted for its defence against the Irish, by whom it was ultimately taken and burned, and its garrison put to the sword.

The population is mostly rural. The towns are few and small. Philipstown, named in honour of Philip the second of Spain, was formerly the capital of the county, but in consequence of its decayed state, the assizes were some years ago transferred to the more important and central town of Tullamore. The place was formerly the site of Dingan Castle, the residence of the O'Conors, who were driven from

Kinghorn it in 1546 by Sir William Bellingham, and forced to fly to
 Kingston. Connaught. The town was taken and burned by King
 James's forces in 1690.

Parsonstown, formerly called Birr, has within a short period risen from an obscure village to the rank of a populous, well-built, and thriving town, second only to Tullamore in importance, and exceeding it in the number of inhabitants. The church is an elegant modern building of the Gothic style. In the town is a low Doric pillar, surmounted by a statue of the Duke of Cumberland, who commanded the English army during the Scotch rebellion in 1745. About a mile from the town are the barracks, capable of accommodating three regiments of infantry. Tullamore, on the Grand Canal, now the principal and assize town, owes its present improved condition to its situation on the Grand Canal, on which it is the principal town. From its central situation it has become a place of considerable business. It is also in some degree indebted for its regular, modern, and respectable appearance, to a conflagration which destroyed most of the mean and ruinous huts of which it chiefly consisted before. Its principal buildings are, the parish church, an elegant modern structure, the county gaol and court-house. The number of inhabitants in 1851 was 4928. No other town in the county, except Parsonstown and Tullamore, contains so many as 2000 inhabitants.

(N. S.—R.)

KINGHORN, a small burgh of Scotland, in the county of Fife, is situate on the Frith of Forth, on the line of the Edinburgh, Perth, and Dundee Railway, and unites with Kirkcaldy, Dysart, and Burntisland, in returning a member to parliament. It is built on the slope of a hill, close by the seashore, and is composed of old and weather-stained houses, several of which are in ruins. The streets are badly kept and irregular, and some of them steep and narrow. Nearly all the population are employed in two flax-spinning mills, turned partly by steam, and partly by water supplied by Kinghorn Loch, a beautiful lake about half a mile N. from the town, and covering about 20 imperial acres. The trade of the port is inconsiderable, and its harbour at Pettycur, which was long the principal ferry on the N. side of the Forth, is now the property of a railway company, and is visited only by a few small vessels. The buildings worthy of note are an elegant school-house, surrounded by a considerable area of play-ground, and a handsome jail of Gothic structure, built upon the site of the ancient chapel of St Leonard's. There are also a half-dilapidated parish church, and two dissenting churches. Kinghorn received charters from Alexander III., David II., James V., and James VI.; and till within a few years ago was ruled by a provost, two bailies, and several councillors: now it is governed by three managers. In early Scottish history it was a place of importance. Here Macbeth is said to have routed the Northmen, and near it stood Glamis Tower, a royal hunting-seat, which Robert II. gave to his son-in-law, Lyon, the ancestor of the Earls of Strathmore and Kinghorn. About a mile westward from the town is the precipice where Alexander III. was killed in 1285. Pop. of burgh and parish (1851), 3030. Kinghorn unites with Kirkcaldy, Burntisland, and Dysart, in sending one member to the Imperial Parliament.

KINGSBRIDGE, a market-town of England, county of Devon, at the head of an estuary of the English Channel, 32 miles S.S.W. of Exeter. The harbour is accessible to small vessels, by means of which some trade in corn, malt, leather, &c., are carried on. Kingsbridge has a free grammar school with three exhibitions at the universities. Pop. (1851) 1679, chiefly maltsters and tanners. Myrtles, orange trees, &c., grow here in the open air.

KINGSTON, the commercial capital of Jamaica, is situate on the S. coast of the island, N. Lat. 17. 57., W.

Long. 76. 49., 16 miles N.E. by rail from Spanish Town. It is built on a gentle slope ascending towards the Liguanea Plain. Beyond this is the lofty ridge of the Blue Mountains; the country around is highly cultivated, and the whole aspect of the place, approached from its magnificent harbour, is not a little imposing as well as picturesque. A nearer view reveals a state of internal disorganization and filth, pronounced by the unanimous testimony of high authorities to be utterly disgraceful to a city so wealthy and important. The streets are regular, the houses built generally of brick, with verandahs, piazzas, &c., to ward off the heat; but there is neither pavement nor sewer, and in the May and October rains torrents sweep the streets, sometimes undermining the houses; the principal thoroughfares are ploughed like river courses, and heaped with stones, rubbish, and filth; while starving dogs, swine, and carrion crows wander about at will, enjoying an atmosphere tainted with congenial odours. As a result of this extraordinary neglect on the part of the city corporation, one-eighth of the population was, in 1850, carried off in about six weeks by cholera. The harbour is completely landlocked, the long narrow reef, on the western extremity of which Port Royal stands, forming a natural breakwater within which there is anchorage for the largest ships. The entrance is narrow and intricate, and is protracted by the Apostle's Battery on the left, and Fort Charles on the right. Further in is Fort Augusta, a place of considerable strength. Kingston was founded immediately after the destruction of Port Royal, the original capital of the island, by the great earthquake in 1692. Port Royal is still, however, an inhabited place, being the naval station for the island. It contains an arsenal, and is well fortified. The principal exports from Kingston are sugar, rum, coffee, pimento, and ginger, the several quantities of which, for the nine months ending July 5, 1855, were 17,600 hhds, 10,558 puncheons, 4,528,110 lb., 4,673,323 lb. and 183,168 lb. The actual value of taxable property in the parish of Kingston in 1851 was estimated at L.700,000; the taxes, public and parochial, amounted to L.19,413. Pop. in 1844 (last census) 32,943, of whom 4253 were whites, the rest black or coloured. See JAMAICA.

KINGSTON, a flourishing town of Canada West, on the N.E. shore of Lake Ontario, county of Frontenac, 177 miles E.N.E. of Toronto. It is substantially built, chiefly of stone, and contains, among other public institutions, a handsome market-house (containing town-hall, &c.), a Presbyterian college, a mechanics' institute, an hospital, &c. Several weekly papers are published. The harbour, which is sheltered by several islands, and protected by two batteries, affords good anchorage up to 3 fathoms. The trade of the port is considerable, and increasing. The value of imports in 1854 was L.276,397, of exports L.96,570, ranking it fifth among Canadian ports, their order being Montreal, Quebec, Toronto, Hamilton, Kingston. It is in the line of the Grand Trunk Railway, and at the head of the Rideau Canal and Cataraqui River, here crossed by a bridge 1800 feet long. On the opposite bank is Fort Henry. As a military position Kingston commands the source of the central St Lawrence; and the neighbouring inlet of Navy Bay is the principal naval station on the lake. Pop. (1842) 11,585.

KINGSTON-UPON-THAMES, an ancient municipal borough and market-town of England, county of Surrey, 10 miles W. of London. It extends about a mile and a half along the river, which is crossed by a fine stone bridge of five arches, is somewhat irregularly built, and contains, among other buildings, a handsome town-hall, an ancient cruciform church much altered, and a Queen Elizabeth grammar school. Pop. 6279, chiefly employed in malting. Kingston was a place of some consequence in the days of the Anglo-Saxons; it returned representatives to parliament in

Kingston
 Kingston-upon-
 Thames.

Kingstown the reigns of Edward II. and III.; and a stone on which seven of the Anglo-Saxon kings are said to have been crowned is still carefully preserved. Numerous interesting Roman antiquities have been dug up in the neighbourhood.

Kinross-shire.

KINGSTOWN, a seaport-town of Ireland, county of Dublin, on the S. side of Dublin Bay, 6 miles E.S.E. from Dublin, by railway. Its name was changed from Dunleary to Kingstown in commemoration of the visit of George IV. in 1821. Queen Victoria landed and embarked here in August 1849. Dunleary was a small fishing village previous to 1816, when its harbour-works were commenced, an account of which will be found under **DUBLIN COUNTY**. It is now a mail-packet station, and a place of extensive trade, the returns of which, however, are included in those for Dublin. It has daily steam communication with Holyhead, Liverpool, Cork, &c. At the entrance to the harbour there is a lighthouse on each pier—that on the E. pier has a light revolving every half minute, and seen 9 miles off. An atmospheric railway, 2 miles in length, connects Kingstown with Dalkey. Pop. (1851) 10,453.

KINNAIRD'S HEAD, a promontory on the E. coast of Scotland, Aberdeenshire, about a mile N. of Fraserburgh. An old castle here is now used as a lighthouse, having a fixed light, 120 feet high, seen 16 miles off.

KINROSS, a town of Scotland, capital of Kinross-shire, is situate in an open vale on the W. side of Lochleven, 28 miles N.W. from Edinburgh. The lower and older part of the town has an irregular and antique appearance, but the more recent portion is much improved. Among the public buildings are the parish church, an elegant Gothic structure, built in 1832, and the county-hall; Free church, and two United Presbyterian churches, a savings bank, two libraries, and several charitable and benevolent institutions. On the margin of the loch, in the immediate vicinity of the town, is Kinross House, built for the residence of the Duke of York, afterwards James VII., in the event of his being prevented by the Exclusion Bill from succeeding to his brother. The town is lighted with gas. The manufactures are noticed under Kinross-shire. Pop. (1851) 2590.

KINROSS-SHIRE, a county in Scotland, bounded on the N.E., E., and S., by the county of Fife, and on the N. and W. by Perthshire, extends from E. to W. about 13 miles, and about 12 from N. to S. It comprehends an area of 77 square miles, or 49,531 English acres, and is, therefore, one of the smallest counties of Scotland.

Kinross-shire is the highest level ground in the peninsula formed by the Forth and the Tay, which was formerly called Ross, or the Promontory, and included the counties of Fife, Kinross, and Clackmannan. From this county the waters flow in every direction. The greater part of the soil is dry, though there are still considerable tracts insufficiently drained, and small portions here and there not drained at all. The subsoil consists chiefly of gravel, though there is also a considerable proportion of till. In regard to drainage and general agricultural improvement, no district has made greater advances within the last twenty years than Kinross-shire. Large tracts of moss and muir have been brought under cultivation; and the rental, which, in 1814, was only L.14,541, 10s., now amounts to L.46,354, 7s. 2d. sterling. There are several lakes in the county, the chief of which is Lochleven, in the immediate vicinity of Kinross. This lake was originally about 15 miles in circumference, and covered an area of 4312 acres; but by an extensive drainage, effected by lowering the bed of the River Leven, and completed in the year 1832, land to the extent of 1202 acres was recovered from the lake, and is now under cultivation. The lake abounds in trout, pike, perch, and eels. There is a long-established fishery (present rental, 200 guineas), the trout being a distinct species, of very delicate flavour, and highly

prized in the London and other English markets, where they bring from 1s. to 2s. 6d. per lb., according to the season of the year. There are several islands in the lake, all of which have been enlarged by the drainage. On one of these, about 4 acres in extent, stands the castle of Lochleven, celebrated as the prison of Mary Queen of Scots; and another, called St Serf's Island, extending to about 60 acres, contains the ruins of an ancient monastery, the seat of a very early Culdee settlement, which occupied much the same position in the east of Scotland as Icolmkill occupied in the west. Several streams flow into the lake, of which the principal are the Gairney, the South Quiech and the North Quiech; and the River Leven, the only stream of any note in the district, issues from its eastern extremity, and after passing through a considerable part of the county of Fife, enters the Frith of Forth at the town of Leven. The prevailing rocks are whinstone, sandstone, and limestone. Coal exists, and is wrought extensively, on the estate of Blair-Adam, on the southern boundary of the county; and it is believed that it exists also to the E. of Lochleven, on the estate of Sir G. Graham Montgomery, Bart., who is about to adopt the usual means with the view of discovering it.

Kinross-shire is divided into a number of small estates, there being very few large proprietors in it. Only about ten landowners hold of the crown; the others hold of these freeholders, the lands having been feued out to them for the most part about the end of the seventeenth and the beginning of the eighteenth centuries; hence, over a considerable part of the county, each individual farm is a separate property, cultivated, in the majority of cases, by its owner. In 1811 the number of freeholders was only 15. The valued rent is L20,250, 4s. 3d. Scots, and the real rent, as already stated, L.46,354, 7s. 2d. sterling. When the land is let to tenants, the leases vary from 14 to 19 years, except in the neighbourhood of the towns and villages, where they vary from 1 to 5 years; and the rents are all paid in money, although, in a considerable number of instances, a part of the rent varies with the variations of the fiars. The size of the farms is from 100 to 500 acres. A fair proportion of them is in grass, for which both the soil and climate are favourable; and inclosures, either of stone-walls, or hedges, or wire-fences, are universal. The principal crops are oats, barley, and wheat: wheat, both spring and autumn, having of late years been extensively sown, and found highly remunerative. Along the banks of the Gairney, there are extensive meadows, some of which are of Timothy grass, and let at from L.6 to L.8 an acre. Cleish Hills, Benarty, the Bishop Hill, and that part of the Ochils which belongs to the county, are pastured chiefly by sheep. Cultivated grass-lands are pastured partly by cattle and partly by sheep, a certain number of the latter being now kept by every farmer, and, in most cases, a part of the turnip crop being consumed by them on the field. The soil is peculiarly adapted to this mode of farming. The district is now well wooded, 1000 acres at least having been planted within the last 25 or 30 years; but the most extensive plantations are on the estate of Blair-Adam, which is not merely finely wooded, but has at least one-third added to its rental yearly from the sale of wood: a revenue which will be permanent, as young trees are regularly planted on the removal of the old.

Besides Kinross, the county town, and Milnathort, this county contains a number of villages. At both these towns several annual fairs are held, and a weekly grain market is held on Wednesday in each. For nearly 20 years, the chief manufactures have been tartan shawls and plaids, and similar woollen fabrics—a branch of trade which has proved uncertain and fluctuating; and in consequence, linen and cotton fabrics are now to some extent taking its place. A large spinning-mill in Kinross employs a considerable number of hands, and so also do the dyeing companies con-

Kinross-shire.

Kinross-
shire.

nected with the various factories in Kinross and Milnathort. In all the parishes in the county, except Cleish, there is a legal assessment for the poor. In Cleish, the heritors still assess themselves voluntarily to supplement what sum may be required, in addition to the church-door collections, for support of the poor.

Kinross-shire sends a member to Parliament along with the county of Clackmannan. Both counties are under the jurisdiction of one sheriff; and there is a resident sheriff-substitute for each, the one at Kinross, and the other at Alloa. Prior to the year 1807, Clackmannan was under the jurisdiction of the sheriff of Stirlingshire, and Kinross under that of the sheriff of Fife; but in the year just referred to, this arrangement was altered by Act of Parliament, and the counties of Kinross and Clackmannan were erected into a separate sheriffdom, the first sheriff of which was the late Lord Moncrieff.

By the Sheriff Court Act (1856), the counties of Linlithgow, Clackmannan, and Kinross, are to be united into one sheriffdom, as soon as a vacancy shall take place either in the sheriffship of Linlithgow or of Clackmannan and Kinross.

The following table gives the population, &c., since 1811:—

Years.	Inhabited Houses.	Males.	Females.	Total.
1811	1364	3466	3779	7245
1821	1419	3660	4102	7762
1831	1524	4519	4553	9072
1841	1812	4195	4568	8763
1851	1662	4305	4619	8924

The census for 1851 shows that 716 males, and 285 females, were farmers, agricultural labourers, or farm-servants; 511 males, and 244 females, were employed in the woollen cloth manufacture; 148 males, and 108 females, in the manufacture of linen; and 161 males, and 130 females, in that of cotton. In 1851, there were 4 Established churches, with 2992 sittings; 4 United Presbyterian churches, with 1762 sittings; and 6 Free churches, with 1371 sittings. There were 23 day-schools—of whom 14, with 1033 scholars, were public, and 9, with 389 scholars, private schools; Sabbath-schools, 14, with 956 scholars.

Kinross-shire comprehends the parishes of Kinross, Orwell, Cleish, Portmoak, Tullibole (now united to Fossoway), with part of Arngask, and part of Forgardenny. All these parishes (except Forgardenny), together with the parishes of Ballingry, Fossoway, and Muckart, are now in the presbytery of Kinross, and connected with the synod of Fife.

Originally the county of Kinross consisted of the two parishes of Kinross and Orwell, with the exception of certain lands which continued in connection with the shires of Fife and Perth till the year 1685. Sir Robert Sibbald states, that the disjunction of these two parishes from Fife, and their formation into a separate county, took place in the year 1426. But this is evidently a mistake; for the *Registrum Magni sigilli Regum Scotorum* shows, beyond all question, that Kinross must have existed as a separate county long prior to 1426. We find there charters of David II. and Robert II. (from 1366 to 1407) giving grants of lands, described as lying "*infra vice comitatum de Kynros*;" and the whole of the lands in question lie within the parishes of Kinross and Orwell. In 1685, there is an Act of parliament "in favour of Sir William Bruce of Kinross, Baronet, for enlarging the shire of Kinross;" a part of the preamble of which is this,—“Considering the smallness and extent of the sheriffdom of Kinross, and jurisdiction thereof, to support and maintain the state and rank of a distinct shire, as it is,” &c., &c. The act proceeds to add to the county of Kinross the parishes of Portmoak,

Kinsale
||
Kiölen.

Cleish, and Tullibole, in the shires of Fife and Perth, and those parts of the parishes of Kinross and Orwell which had previously lain in those shires. At a later date, a part of the parish of Arngask, and a part of the parish of Forgardenny, were added to the county of Kinross.

The table of the Agricultural Statistics of Scotland for 1856 gives the number of occupants in this county at 304, and the total acreage under a rotation of crops, 33,783, as follows (omitting fractions):—Wheat, 1770; barley, 2474; oats, 7659; rye, 4; bere, 13; beans, 116; peas, 35; vetches or tares, 247; turnips, 4346; potatoes, 1053; mangold, 2; carrots, 7; cabbage, 11; flax, 15; turnip seed, 44; bare or summer fallow, 168; grass and hay under rotation, 15,813. The number of horses in 1856 were 1569; cattle, 8288; sheep, 25,810; swine, 869. (W. P.—S.)

KINSALE, a parliamentary and municipal borough and seaport-town of Ireland, county of Cork, on the N.E. side of the estuary of the Bandon, about 3 miles from the sea, and 14 miles S. from Cork. The town is built principally on the side of Compass Hill, and hence has a fine appearance when viewed from the harbour; but on entering it, the streets are found to be narrow and inconvenient, some of them being so steep as not to admit carriages. The houses are for the most part antiquated in appearance, some of them having bay-windows and balconies after the Spanish fashion. The harbour is excellent, having a depth of 14 feet of water at the mouth at low ebb, and from 6 to 8 fathoms at a cable's length from the shore, with accommodation for 300 sail of vessels. Its entrance is protected by Charles Fort, now a barrack. Notwithstanding these advantages, the trade of the port is very trifling, owing to its proximity to Cork. The town is chiefly dependent on the fisheries, the proceeds of which are said to average L.500 a week. The fishing-boats of the port, called hookers, are generally of from 15 to 20 tons. Lobsters and oysters are taken along the shore. Kinsale is much resorted to in the summer season for sea-bathing. Pop. (1851) 5506. (Thom's *Irish Almanac*).

KINTORE, an ancient royal and parliamentary burgh of Scotland, Aberdeenshire, 12 miles N.W. of Aberdeen. It contributes to Elgin in returning an M.P., and gives the title of Earl to the younger branch of the Keith family. Pop. 476.

KINTYRE, or CANTYRE, (*Ceann-an-tir*, the “head of the land”), a long peninsula in the S. of Argyshire, constituting one of the five principal natural divisions of that county. It is about 40 miles in length, with an average breadth of from 6 to 7, and is connected with the district of Knapdale by the narrow isthmus of Tarbert. Kilbrennan Sound separates it on the E. from Arran. Its south-western extremity, the Mull (*Maol*, a bluff) of Kintyre, is about 10 miles from the Irish coast. Here, on the rocks called the Merchants, is a lighthouse 297 feet above the sea level, with a fixed light visible at 22 miles. The surface of this district is for the most part rugged and hilly, but there is a fair proportion of good arable land. The principal harbours on the coast are those of Campbelton, and Tarbert East and West. Of antiquities in the district, Skipness Castle is the most notable.

KIÖGE, a small town of Denmark, on a bay of the same name, in the island of Zealand, 24 miles S.W. of Copenhagen. In the roadstead of Kiöge, in 1676, a complete victory was gained over the Swedes by the combined fleets of Denmark and Holland.

KIÖLEN, the northern portion of the great Scandinavian mountain system, commencing to the N. of Trondhjem, and extending to the North Cape. It is about twice as long as the southern range, the Norrska Fiellen, but much narrower and lower, and diminishes in elevation towards the N. The culminating point is Sulitelma, near Lat. 67°, which is above 6000 feet high. See NORWAY.

Kiong-
Tehou
" "
Kippis,
Andrew.

KIONG-TCHOU, the capital of the island of Hainan, in China, is a well-built and walled city, with a population estimated at from 100,000 to 200,000. It has an excellent harbour and a large trade.

KIPPIS, ANDREW, D.D., a learned and laborious compiler of the 18th century, was born at Nottingham in 1725. Sprung from a family which had given many ministers to the Established Church, but had left it on the passing of the Uniformity Act, he cast in his lot with the Dissenters. On leaving the school of Sleaford, in Lincolnshire, he entered the theological academy at Northampton, then presided over by the learned and pious Dr Doddridge. The course extended over five years, and at the end of that time he obtained a charge at Boston, in Lincolnshire, where he remained from 1746 to 1750. Translated to Dorking, in Surrey, he ministered there for three years, and in 1753 became pastor of the Presbyterian church of Long Ditch, in Westminster. Among his predecessors in that charge had been the famous Calamy and the learned Hughes. Besides his ordinary professional duties, he took an active part in the temporal affairs of the religious body to which he belonged, managing the various trusts and funds with much adroitness and success. In 1763, he was appointed classical tutor in Coward's Academy, a training college for English dissenters, and held that office for upwards of twenty years. When another institution of the same kind was opened at Hackney, in 1786, he was made, very much against his will, one of the tutors. In 1778 he became a Fellow of the Antiquarian, and in the following year a Fellow of the Royal Society. He died in 1795, in the seventy-first year of his age. He enjoyed all his life, and very deservedly, a high character for piety, active and unobtrusive benevolence, and all the personal virtues which endear a man to his friends and to society.

Though actively engaged in professional life, Kippis was one of the most voluminous writers of his day. He contributed largely to the *Gentleman's Magazine*, and the *Monthly Review*, at that time the leading periodicals of Great Britain, and had "a main finger" in establishing the *New Annual Register*, the object of which was to counterbalance the political influence of the original work of that name. But he established a more enduring claim on the regard of posterity by his edition of the *Biographia Britannica*. He unfortunately did not live to complete the work he had begun, which, besides, was on a scale far beyond the strength of any one editor, however able. At the time of his death he had only brought it down as far as "Faust." Many new lives were incorporated, written for the most part by the editor himself, and extensive additions and corrections made on the original text. The immense labour and research of the work, and the honest desire to reach the truth, independent of all party or personal leanings, have made it one of the best books of its kind in existence. The plan, however, is defective. Instead of fusing his corrections into the original, he reprinted the text as it stood, and threw his own corrections into the form of foot-notes, which often gives the work the air of a long controversy, and swelled it beyond all reasonable bounds. The writing, though honest and careful, and evidently the best that the writer had to give, is often languid and tamely monotonous, and unrelieved either by the graces of fancy and sentiment, or by any novelty or depth of moral reflection. The articles are also conceived in a spirit of universal benevolence, which delights to dwell on the virtues of humanity, but shrinks from boldly rebuking and denouncing its follies, its vices, and its crimes. As a mere storehouse of facts, however, the work possesses a genuine value, and has not yet been superseded. Some of Kippis's longer contributions, such as his "Life of Captain Cook," were reprinted separately. He also published a volume of sermons, and prepared a collected edition of the works of Dr Nathaniel Lardner, to which he

prefixed a life of that distinguished theological scholar. He rendered a similar service to the good name of his old friend and teacher, Doddridge.

Kirby,
William.

KIRBY, WILLIAM, an eminent English naturalist, and one of the earliest, and still the most popular of British entomologists, was born in 1759, at Winesham, in Suffolk. Sent first to the school of his native village, and afterwards to the grammar school of Ipswich, he removed in due course to Caius College, Cambridge, where he took his bachelor's degree in 1781. In the following year he entered the church, and was appointed to the curacy of Barham, which office he held for fourteen years. Such time as he could steal from his pastoral duties he devoted at this period of his life to botany, of which he was an ardent student. The rector of the parish adjoining his was William Jones, well known as the author of a work on the Trinity. Under the influence of this able controversialist, Kirby's views of religion and politics became fixed and confirmed. Pious, and sincerely evangelical in his preaching, he was a strong supporter of government, and was even induced to use his pen in counterworking the spirit of free-thinking then reacting from France upon England. But he had little taste for controversy, and, retiring from that field, he devoted himself wholly to his favourite study of natural history. In a letter to a friend he describes how his attention was first drawn to the science of entomology. "Observing, accidentally, one morning a very beautiful golden bug (the 'lady-bird,' or 'cow-lady,' *Coccinella*, 22 *punctata*), creeping on the sill of my window, I took it up to examine it, and finding that its wings were of a more yellow hue than was common to my observations of these animals before, I was anxious carefully to examine any other of its peculiarities, and finding that it had twenty-two beautiful clear black spots upon its back, my captured animal was imprisoned in a bottle of gin for the purpose, as I supposed, of killing him. On the following morning, anxious to pursue my observation, I took it again from the gin and laid it on the window-sill to dry, thinking it dead, but the warmth of the sun very soon revived it; and hence commenced my further pursuit of this branch of natural history. Encouraged by some of the local naturalists to persevere, he made frequent entomological excursions, and greatly enlarged his knowledge of the science. When the Linneæan Society was founded in 1788 by Sir J. E. Smith, Kirby immediately became a member, and contributed many valuable papers to its *Transactions*. The first separate work by which he made his name widely known was his *Monographia Apum Angliæ*, published at Ipswich, in 2 vols., in 1802. This, as the first scientific treatise on the bees of England, brought him into notice with the leading entomologists, not only of his own country, but also of the Continent; and from this time he corresponded frequently with Latreille, Fabricius, Illiger, Walckenaer, and other eminent naturalists in France and Germany. In 1805 Kirby had formed the acquaintance of Mr Spence, a scientific gentleman of Hull, whose studies had lain very much in the same direction as his own. Three years later the two friends struck out between them the idea of popularizing the science which both had pursued with so much pleasure and benefit to themselves. The practical result of this idea was the work known as *Kirby and Spence's Introduction to Entomology*, one of the most popular books of science that has ever appeared in any tongue. The first volume was published in 1815; a second edition of it was called for in the following year, and a third in 1817, when, also, was published volume ii., of which a second edition was required in 1818, and a third in 1822. The bad health of Mr Spence interrupted the progress of the work for some years, and the concluding volumes (iii. and iv.), did not see the light till 1826. Seven editions (the last of them in 1856), prove that its popularity continues undiminished. The form and

Kirchheim style of the work were eminently calculated to ensure success. A series of familiar letters, couched in easy and almost gossiping terms, is made the vehicle of strictly scientific information on the structure, habits, uses and instincts of the insect world. Of the fifty-one letters comprised in the series, thirteen were written solely by Kirby, and eight by Spence, while the remaining thirty were produced conjointly. The appendix was supplied by Kirby, and the preface by his collaborateur.

In 1830, Kirby, though then in his seventieth year, was appointed to write one of the *Bridgewater Treatises*. He chose as his subject the *Habits and Instincts of Animals, with reference to Natural Theology*. The wide range of his theme drew him beyond his own proper province, and led him into tracks with which he was less familiar. But though his Treatise fell short of his earlier works in point of scientific value, it was admitted to have admirably fulfilled the purposes of the Bridgewater trust. The most important of his other works was his description of the insects introduced in Sir John Richardson's *Fauna Boreali-Americana*. A volume of sermons which he published in 1829, met with no great success.

Kirby never obtained any preferment in the church commensurate with his deserts. For fourteen years he remained curate of Barham, and in 1796, on the death of the rector of the parish, he was appointed his successor. He held the living till his death, on the 4th July 1850. Before he died, he had the satisfaction of seeing a knowledge of his favourite science widely disseminated throughout England, and numerous societies formed for its advancement. He was himself a member of most of the scientific corporations in England, on the Continent, and in the United States. A very detailed biography of him, by his friend the Rev. John Freeman, M.A., was published in London in 1852. The most valuable chapter in that work is contributed by Mr Spence, and from it most of the details of this notice have been taken. (See art. ENTOMOLOGY.)

KIRCHEIM, a town of Würtemberg, circle of the Danube, pleasantly situated on the Lauter, 30 miles N.W. of Ulm. It is well built, and has an ancient castle. There are manufactures of cotton and linen stuffs, strawplait, &c., and some trade in cattle, wool, and wine. Pop. 5256.

KIRCHER, ATHANASIUS, a celebrated historian, philologist, mathematician, and physical philosopher, was born May 2, 1602, at Geysen, a small town near Fulde in Germany. His parents were humble, but respectable, and exerted themselves to give him a good education. Having finished his studies, he joined the society of the Jesuits, where he found new means of satisfying his passion for learning, and applied himself with equal ardour to almost every department of knowledge. Being appointed to teach philosophy, and afterwards the oriental languages, in the college of Wurtzburg, he acquitted himself of this double duty in the most satisfactory manner. When the Thirty Years' War broke out he retired into France, and settled in the Jesuits' College at Avignon, where he passed two years, entirely occupied with the study of antiquities. It was during his residence in this city that he became acquainted with the learned Peiresc, who advised him to attempt to decypher the Egyptian hieroglyphics, a task to which he afterwards applied himself with great zeal, though, unfortunately, with but indifferent success. Appointed professor of mathematics at Vienna, he was preparing to return to Germany, when he received an order to repair to Rome, whither he accordingly proceeded without delay. In 1637, the pope charged him to accompany Cardinal Frederick of Saxony to Malta, where he was received by the Knights of St John with much distinction. He next visited Sicily and the kingdom of Naples, and then proceeded to take possession of the chair of mathematics in the Roman College, a

situation which he filled for eight years, and only relinquished to apply himself to more congenial pursuits. In his researches and experiments he received valuable aid from many princes and nobles of Germany, Italy, and Spain; and through their liberality was enabled to collect a splendid museum of antiquities, which he left to the Roman College, and has been frequently illustrated. He died at Rome, Nov. 28, 1680, the same day on which Bernini and Grimaldi expired.

Kircher was a man of wide and varied, but ill-digested erudition, and a most voluminous writer. He had a vast memory, and indefatigable perseverance; but was totally devoid both of judgment and critical skill. He was likewise credulous in an absurd degree; and from an idea that he could solve any question, however difficult, he stated the wildest fictions, and arrived at the most ridiculous conclusions with undoubting faith and self-complacency.

The works of Kircher are very numerous. A complete list of them is given in Sepi's account of his museum, published at Amsterdam in 1678.

The most important of them are,—*Ars Magnetica sive Conclusiones Experimentales de effectibus Magnetis*, Wurtzburg, 1631, in 4to; *Magnes sive de Arte magnetica Opus tripartitum*, Rome, 1641, in 4to; *Ars magna Lucis et Umbræ in x. libros digesta*, Rome, 1645, 1646, in folio; *Diatriba de prodigiis crucibus quæ non pridem post ultimum incendium Vesuvii montis Neapoli compaeruerunt*, Rome, 1681, in 8vo; *Scrutinium physicomedicum contagiosæ luis quæ pestis dicitur*, Rome, 1658, in 4to; *Prodromus Copticus sive Ægyptiacus, in quo linguæ Coptæ sive Ægyptiacæ quondam Pharaonica, origo, ætus, &c. exhibentur*, Rome, 1636, in 4to; *Lingua Ægyptiaca restituta, sive Institutiones grammaticales et Lexicon Copticum*, Rome, 1644, in 4to; *Edipus Ægyptiacus, hoc est universalis Hieroglyphicæ veterum Doctrinæ, temporum injuria abolitæ, instauratio*, Rome, 1652, in folio; *Latium, id est nova et parallela Latini tum veteris tum novi Descriptio*, Amster., 1671, in folio.

The most valuable of those works of Kircher's are those relating to the Coptic and Egyptian tongues, which, though now quite superseded, comprised all that was known on these points in his day; and his *Latium*, which may even now be consulted with profit for its maps and plans, and its minute descriptions of many objects of great interest, such as Hadrian's Villa.

KIRKCALDY, a royal and parliamentary borough and seaport in Fifeshire, about 12 miles N. from Edinburgh, lying along the margin of a bay on the N. shore of the Frith of Forth. It consists chiefly of one street, nearly 2 miles long (whence the name *Lang town*), with smaller streets and lanes opening into or running parallel with it. To the W. of the royalty, but within the parliamentary boundaries of the town, are the villages of Linktown, in the parish of Abbotshall, and the village of West Bridge, in the parish of Kirkhorn.

In 1334 Kirkcaldy was mortified by King David II. to the Abbey of Dunfermline, the commendator and monastery of which sold it in 1540. On 5th February 1644 it received a charter of erection and novodamus as a royal burgh from King Charles II., and in this charter he conveyed the burgh to the bailies, councillors, and community, along with the harbour and about 487 acres of land.

The government of the burgh is vested in a provost, two bailies, a dean of guild, and sixteen councillors. There are also still seven incorporated trades. In 1811 an act of parliament was obtained for its improvement, and since that time great changes have taken place on the exterior of the town.

The revenue, under the charge of the magistrates and council, for 1855-56, amounted to L.700, 10s. 10d.; the ordinary expenditure was L.530, 19s. 5d.; the nett debt, L.535, 19s. 8d..

The port, situated near the E. end of the town, consists of an outer and an inner harbour, both of which have been of late deepened and improved. The depth of the water at the entrance in spring tides is 15 feet. The management

Kirkcaldy.

Kirghiz.

of the harbour is vested in commissioners, who pay L.300 a-year for municipal purposes, and engage to clear off the debt of the town, amounting to L.11,086, 13s. 10d. The harbour revenue for 1855-56 amounted to L.1594, 5s. 11d., the expenditure to L.1351, 0s. 8d., leaving a surplus of L.243, 5s. 3d. The nett debt of the commissioners is L.14,355, 15s. 3½d.

The Kirkcaldy custom-house includes under its superintendence all the ports from Aberdour on the W. to St Andrews on the E. On 31st December 1855 the number of vessels belonging to these ports was ninety-eight, and their tonnage 8646. The vessels employed in the foreign trade for the year ending 5th January 1856 numbered—inwards, 135; and outwards, 285. The tonnage of those inwards was 15,892; and outwards, 27,283. The number of vessels employed in the coasting trade during the same period was 490 inwards, their tonnage 24,928; and outwards 1059, and their tonnage 54,262. The Kirkcaldy custom-house revenue for the year ending 5th January 1854 was L.9060; 5th January 1855, L.7020; and 31st March 1856, L.10,040.

Kirkcaldy is now the principal seat of the spinning department of the linen trade in this county. The value of goods manufactured in Kirkcaldy in 1815, when the trade was depressed, was estimated at L.125,981. It is now considerably increased. There were, in 1836, ten spinning-mills within the parliamentary limits of the burgh, turning upwards of 4895 spindles, and within these limits this trade is now greatly enlarged. There are also four bleachfields connected with the town, four iron foundries, and one coal-work near the town, at which are raised upwards of 15,000 tons of coal annually.

Among its commercial and literary institutions may be mentioned the chamber of commerce (founded in 1825), two public libraries, two news-rooms, &c.

Besides the public schools in the burgh, frequented by about 300 scholars, the parochial school in Linktown for the parish of Abbotshail, and adventure schools, which receive about 700 scholars, there is a provision for gratuitous education in schools founded by Mr Robert Philp, merchant in Kirkcaldy, who died in 1829, and left a sum of money, now amounting to upwards of L.74,500, for their support. The gross revenue of the charity for the year ending in 1856 was L.2882, 2s. 4d. The scholars at present educated on this foundation-number, in Pathhead, 280; in Kirkcaldy, 100; in Linktown and Bridgetown, 180; and in Kinghorn, 73.

The Sailor Guild, or Prime Gilt Box of Kirkcaldy, for the relief of destitute sailors and their families, has existed since 1590. Its average revenue amounts to L.110 yearly.

Dr Adam Smith, the author of the *Wealth of Nations*, was born in Kirkcaldy, and his bust, along with that of Sir Robert Peel, is placed in the town-hall.

Kirkcaldy unites with Dysart, Burntisland, and Kinghorn in returning one M.P.; parliamentary constituency, 400. Pop. 10,475.

KIRGHIZ, STEPPE OF THE, an extensive country of Western Asia, comprising the northern part of Independent Turkistan, and lying between N. Lat. 44. and 55., and E. Long. 53. and 82. It is bounded on the N. by Russian Siberia, E. by the Chinese Empire, S. by the khanats of Khokan, Bokhara, and Khiva, and W. by the Ural and the Caspian Sea.

The surface is not a mere flat plain, but is traversed by numerous mountain chains, particularly in the W. and N.W. There are a considerable number of rivers and lakes, many of the latter being salt. The extremes of heat and cold are very great; in summer the temperature often rises to 112° Fahr.; while in winter it is frequently many degrees below zero. The inhabitants are a nomadic race, almost solely occupied in the rearing of sheep, goats, horses, and

camels, which constitute their principal wealth. They relieve the monotony of their life by hunting, and not unfrequently by plundering caravans, or by attacking some neighbouring tribe. They are divided into the Great, Little, and Middle Hordes, which are again subdivided into numerous tribes, each having its own khan or chief. Pop. estimated at 2,260,000. See *ASIA*.

KIRCUDBRIGHTSHIRE, a county in Scotland, situate between N. Lat. 54. 43. and 55. 19., and W. Long. 3. 33. and 4. 34. from Greenwich, is bounded on the N. by the shires of Dumfries and Ayr, on the E. and S. by the Solway Frith and the Irish Sea, and on the W. by the county of Wigtown. It derives its name from *Caer*, a fort, the Anglo-Saxons having erected a fort in honour of St Cuthbert, near the site of the present Kirkcudbright (originally *Caer Cuthbert*), the county town. It is in length from E. to W. about 48 miles: it varies in breadth from 30 to 40 miles; and it contains 954 square miles, or 610,734 acres. This district is commonly called the *stewartry*, not the shire, of Kirkcudbright; and its judge, whose powers and duties are the same as those of a sheriff, is called a *steward*. The appellation of *stewartry* had its rise in the ancient tenure by which it was held, and the subsequent forfeiture of its lords; but the distinction between *stewartry* and *sheriffdom* is in this case purely nominal. Kirkcudbright is one of the two counties comprehended under the general name of Galloway; Wigtownshire, on the W., being the other.

About two-thirds of the surface is mountainous. A range of mountains stretches along the whole northern boundary, in the form of a vast amphitheatre, embracing nearly half the county; on the boundary with Ayrshire they are not much inferior in height to any in the South of Scotland. There are also some considerable mountains on the southern extremity, such as Criffel, 1831 feet in height; Cairnmore, 2597; and Cairnharrow, 1110. The high lands are, for the most part, covered with heath, except on a part of the northern boundary, where a narrow tract of green hills runs out between the counties of Ayr and Dumfries; and many of them are wet and mossy. In the middle of the district, the declivity is so gentle that the River Dee, at 30 miles from its mouth, is only 150 feet above the level of the sea; yet, even in the interior, there is no great extent of level ground, the greater part of the surface being occupied by rocky knolls, steep banks, and hills of a moderate elevation. On the coast, also, hills rise almost everywhere to the height of several hundred feet. The district is studded with a great number of lakes, of which there is one or more in almost every parish, though few of them are considerable. As there is much full-grown wood, the general appearance of the *stewartry* is that of a varied, rich, and interesting county, on which much capital and labour have been expended; and its natural beauties are in many places very striking.

The soil of the lower grounds is, for the most part, of a hazel colour, sometimes inclining to red, and seems to be chiefly composed of argillaceous schist in a state of decomposition. It is seldom of any great depth, and the rock, often rising above the surface, gives a rugged appearance to much even of the arable land. This soil is, however, in many instances possessed of great natural fertility, not soon injured by wet seasons, and affords plentiful crops and fine natural herbage. Clay is of no great extent, and found chiefly on the banks of the rivers. The smooth round hills accessible to the plough have, for the most part, a close subsoil, here called *till*, and do not, therefore, admit of being profitably cultivated but after an interval of several years' pasturage. Tracts of moss, which once existed, have greatly disappeared, having been converted into rich arable fields.

Much of the mountainous district is composed of granite. According to the *Agricultural Survey* there are three several districts of this rock, which occupy nearly a fourth

Kirkcudbright-shire.

Kirkcud-
bright-
shire.

of the surface. Strata of argillaceous schistus prevail in the lower parts. Some of it is of a hard, compact grain, of a blue or grayish-brown colour, for the most part breaking irregularly, but often in parallel plates, of which coarse slates have been made. With these are intermixed layers of a softer argillaceous stone, which readily yields to the weather, and is popularly known by the name of *slate band*. These rocks, which also occupy a large part of the district, are sometimes traversed by dykes of porphyry, and also by granite. In the neighbourhood of Dumfries the prevailing rock is sandstone. Limestone is found at Kirkbean, the only place in the county where it is wrought; and there are also some promising indications of coal on the estate of Arbigland, near Dumfries. In the parish of Colvend, on the Solway Frith, there is a quarry which affords millstones. Lead mines were wrought in Minnigaff and Anwoth for many years, but have been discontinued. Iron ore abounds, but, from the want of coal and wood, it is of little value. On the estate of Cally, near Gatehouse, copper has lately been discovered, but the yield has not been remunerative.

The rivers are,—the Nith, which separates this county from Dumfriesshire for about 12 miles on the N.E.; the Urr, which flows S.E. by the village of Dalbeattie, and is navigable 5 or 6 miles for small vessels; the Dee, the largest river, which enters Loch Ken, a lake almost in the centre of the county, about 8 miles in length, and in some places a mile in breadth, and, giving its name to the river (Ken), which issues from the lake, falls into the Solway Frith about 5 miles below the town of Kirkcudbright. It is navigable for 2 miles above this town for vessels of 200 tons. In spring-tides the water rises about 20 feet at Kirkcudbright, where there is a well-sheltered natural harbour, of easy access. For the last 7 or 8 miles of its course the banks of the Dee are planted. St Mary's Isle, near Kirkcudbright, is a highly ornamented spot; and the Little Ross, a beautiful island, is situated at its mouth. There are other small islands, as those of Fleet, Knockbrex, and Heston, scattered along the coast. The salmon fishery on this river was rented, some years ago, at L.900. The Fleet is remarkable for the picturesque scenery on its banks; but as its stream is circuitous towards the end of its course, a canal of about a mile in length has been cut, at the sole expense of the late Mr Murray of Broughton, by means of which the navigation to Gatehouse, about 4 miles from the sea, has been rendered easy and shorter. The Cree, a more considerable river, separates this county from Wigtonshire, and flows into the bay of Wigton, whence it is navigable to the small harbour of Carty, a little below Newton-Stewart. The rivers are nearly equidistant from each other; and the richly wooded valleys through which they flow, combined with the intervening hills or eminences, impart a character of variety and beauty to the county which is very picturesque, and is seldom surpassed. The stewartry is everywhere supplied with pure springs and rivulets. Chalybeate springs are also numerous, one of which, Lochenebreck, in the parish of Balmaghie, 7 miles from Gatehouse, is said not to be inferior in medicinal virtues to any in the kingdom.

The landed property is not divided into large estates. The number of proprietors in 1854 was 413; of whom 180 had a valuation not exceeding L.50 Scots per annum; 66 not exceeding L.100; 65 not exceeding L.200; 55 not exceeding L.500; 26 not exceeding L.1000; 14 not exceeding L.2000; 3 not exceeding L.5000; 3 not exceeding L.10,000; while there was only one (Murray of Broughton) above the last sum. The valued rent, which was taken in 1642, is L.114,637, 2s. Scots; the real rent, in 1808, was estimated at L.167,125 sterling; and in 1855 at L.213,308, exclusive of the burghs of Kirkcudbright, New Galloway, and Maxwellton. Many of the smaller proprie-

Kirkcud-
bright-
shire.

tors cultivate their own estates. About half the county is held under deeds of entail, and no disentails have as yet taken place under the Act 11th and 12th Victoria. "The condition of the peasantry, at a period not very remote, seems to have been much depressed, and the state of husbandry rude and barbarous in the extreme." (Smith's *Survey*.) Referring to the year 1720, John Maxwell of Munshes observes that "the tenants in general lived very meanly, on kail, groats, milk, graddon ground in querns turned by the hand, and the grain dried in a pot, together with a crock ewe now and then about Martinmas. They were clothed very plainly, and their habitations were most uncomfortable. Their general wear was of cloth made of waulked plaiding, black and white wool mixed, very coarse, and the cloth rarely dyed. Their hose were made of white plaiding cloth, sewed together, with single-soled shoes, and a black or blue bonnet, none having hats but the lairds."

In 1725 potatoes were first introduced into this stewartry by William Hyland, from Ireland, who carried them on horses' backs to Edinburgh, where he sold them by pounds and ounces. During these times, when potatoes were not generally used in this country, there was for the most part a great want of food, bordering on famine; for in the stewartry of Kirkcudbright there was not as much corn produced as was necessary for supplying the inhabitants. The produce of the country in general was gray oats; and you might have travelled from Dumfries to Kirkcudbright, which is 27 miles, without seeing any other grain, except in a gentleman's croft, which in general produced bere or bigg for one-third part, another third in white oats, and the remaining third in gray oats. At that period there was no wheat raised in the country; what was used was brought from Teviot, and it was believed that the soil would not produce wheat. In the year 1735 there was no mill for grinding that sort of grain; and the first flour-mill that was constructed within these bounds was built at Clouden, in the parish of Irongray, some years after that date." (Murray's *Literary History of Galloway*, 2d edition, 1832, pp. 337-9.) Yet it was in this county that the improvements of modern husbandry were adopted, at a time when they were entirely unknown in the greater part of the kingdom. As early as the year 1750, Mr Craik of Arbigland practised the drilling and horse-hoeing of the celebrated Tull, which he ever afterwards continued to follow in the culture of beans and turnips. He enclosed and drained his estate, cleaned his fields by fallowing, applied calcareous manures, introduced sown grasses into his course of crops, and worked his plough with two horses. A few of the other proprietors followed in his steps, but their efforts were not seconded by the tenantry at large. It is only since the end of last century that modern husbandry has made any considerable progress, but it is now quite general. The following is the proportion of crops, according to the agricultural statistics procured in 1856 by the Highland Society. The total acreage under rotation of crops was 120,792; of which the constituent crops were,—wheat, 2441; barley, 1464; oats, 33,753; rye, 58; bere, 55; beans, 503; pease, 2; tares, 84; turnips, 15,154; potatoes, 3112; mangold, 100; carrots, 46; cabbage, 10; rape, 153; flax, 9; turnip-seed, 26; bare fallow, 287; grass and hay under rotation, 63,707. Total stock, 353,869—being, horses for agriculture, 5190; other horses, 793; milch cows, 9107; other cattle, 24,012; calves, 6731; sheep, 301,603; swine, 6433.

A great impetus has lately been communicated to agriculture in this county, by the regular and cheap communication with Liverpool by means of steam navigation. The farmers have thus a ready outlet for their disposable produce, corn, cattle, and sheep, and receive cash payments. Instead of being, as formerly, far from a market, and forced, in consequence, to sell to corn-dealers, a class of men with whom bankruptcy was anything but uncommon; the far-

Kirkcud-
bright-
shire.

mers are now, as it were, placed in the very vicinity of the best market, and are freed from all risk of non-payment. By these favourable circumstances, a spirit of improvement and enterprise has been roused which has changed the face and character of the county. Nothing, indeed, has ever effected so important a change in the circumstances of this county as the introduction of steam navigation. The first steam-boat seen on its shores was in 1830; and there are now six that ply regularly between it and the English coast, particularly Whitehaven and Liverpool. Their decks are covered with sheep and black cattle, whilst their holds are filled with corn. Nor is this all. These vessels have opened up channels of industry before unknown. Poultry, eggs, and butter, by being sent to the ready market of England, form a new and pretty productive source of income. Salmon, instead of being sent, as formerly, round to England by the expensive mail-carriage, is now transmitted thither by steam more directly, and at much less expense; whilst commodities required from England are obtained under the most favourable circumstances. Railways are about to be introduced. A bill has been got for forming a line between Dumfries and Castle-Douglas, a distance of 18 miles; and application is to be made in the ensuing session of parliament for a line from the latter place to Portpatrick, a farther distance of 56 miles. This railway accommodation, combined with the steam navigation already referred to, will thoroughly open up this otherwise remote county, and connect it with the most important marts of commerce.

Unlike other hilly tracts in Scotland, the land is almost universally enclosed, chiefly with stone walls, called *Galloway Dykes*. These dykes are built close, or double, as it is called, for part of their height, and afterwards single, the stones in the latter part being laid in such a manner as to allow the passage of the light through the wall. But it is now becoming a common practice to build the whole of the wall double, and, after laying a course of stones that project a little beyond its breadth on both sides, it is completed by a coping of stones laid on edge, and closely pinned.

This county is chiefly celebrated for its cattle, which form by far the most important part of its agricultural produce. They are known in every part of Britain by the name of *Galloway cattle*. Sheep are confined to the mountainous districts, where they are kept in great numbers. They are of the heath or black-faced variety, with coarse wool. A small, hardy, and active race of horses, called *Galloways*, was formerly reared here and in Wigtonshire, the other division of Galloway; but a larger breed being required for the labours of modern husbandry, the old race is very rarely to be found in a pure state. The name, however, is frequently applied to horses below full size, wherever they may have been reared.

The first road act for the stewartry of Kirkcudbright was obtained in 1779. At that period there was scarcely anything that deserved the name, except the military road from Dumfries to Portpatrick, which had been made about fifteen years before; but at present very few districts are better provided in this respect. The first good roads were made on the estate of the Earl of Selkirk, under the direction of his son Basil William Lord Daer, to whom this county owes many other improvements. In 1796, by another act of parliament, the assessments were allowed to be increased, and tolls erected; and soon afterwards a new road was made from Dumfries to Castle-Douglas, a distance of 18 miles, through a hilly, broken country, with so much attention to preserve the level, that it has seldom a rise of more than one foot in forty, and much of it is nearly a perfect level. All the principal roads made since have been done with equal judgment. The turnpike roads extend to nearly 300 miles; and the annual income obtained from tolls amount to about L.3200. The district is also well

accommodated with bridges, of which the most considerable is one over the Dee at Tongland, about 2 miles above Kirkcudbright, which has an arch of 110 feet span. It is built of sandstone, brought partly from Annan in Dumfriesshire, and partly from the Isle of Arran. It was finished in 1803, and cost upwards of L.7000.

Kirkcudbright, the county town, which was erected into a royal burgh in 1455, contained, in 1851 (including the parish), a population of 3555. It is pleasantly situated on the Dee, and is noted for the information and urbanity of its inhabitants. Societies have been formed here for a purpose rather unusual, namely, the building of houses, not for sale, but for the use of the members who compose them. Every member makes a small monthly payment into a general fund, which is employed in erecting the houses, and these, as they are finished, are assigned to the members by lot, those to whom they fall paying five per cent. on the money which their houses have cost in addition to their monthly payments; and this arrangement continues till all the members are supplied, and the societies dissolved. New Galloway, which was erected into a royal burgh in 1633, is situated at the head of Loch Ken, and contains only about 400 inhabitants. The principal villages are Creetown, at the mouth of the River Cree, on the bay of Wigtown; Gatehouse, 12 miles E. from the former, on the River Fleet; and Castle-Douglas, formerly called Carlinwark, an inland place, about 9 miles N.E. of Kirkcudbright. The others are Dalbeattie, on the River Urr; Keltonhill, noted for its cattle fairs in June and November; and Maxwellton, on the Nith, which, though in this county, belongs by its situation to the town of Dumfries, from which it is separated only by the bridge over that river. By the Reform Act, indeed, it is included within the parliamentary boundaries of that town. Previously to the passing of the Poor-law Act in 1844, the poor were supported solely by church collections, occasionally supplemented by voluntary contributions, chiefly on the part of the heritors. Legal assessments have now been introduced in every parish, except five; and the number of registered poor is 1549; that of casual poor, 712; total, 2261. The total expense for the former is L.8228; for the latter L.440; making an aggregate of L.8668; a fraction more, both as to number of paupers and amount of assessment, than the general average of Scotland. There is a poorhouse combination, comprising 14 parishes.

The inhabitants of the stewartry have few traits of character peculiar to themselves. Living remote from the capital, or any large town, they are a simple unsophisticated people, feudal and superstitious in their sentiments. A belief in witchcraft, and in the more popular superstitions, obtained till recently. They think no character superior to the minister or the laird. These peculiarities, however, are beginning to give way. Education has attained a most respectable footing; and the collision of sentiment which the people experience by the intercourse now opened up by the facilities of communication with strangers, has had a most salutary and liberalizing influence. They are an enterprising people. They send, on an average of the last ten years, about thirty young men to the university yearly; and the number of those who annually cross over to England to push their fortune, or emigrate either to our own colonies or to foreign states, is extremely great. Of these, not a few, after experiencing success in life, return to their native country with a respectable competency; and thus, by their example, stimulate others to follow their steps. Of the extent to which emigration from this county is carried, a correct estimate may be framed from the fact that, though the number of males born is about five per cent. above that of females, the latter in the stewartry exceed the former by 2674. A great number of Irish, of the lowest grade, are settled here.

Kirkcud-
bright
shire.

Education, as mentioned above, is in an efficient state. Some of the schools are excellent; none of them are bad; and when a vacancy now takes place the utmost pains are taken to get the best teacher to fill it. Several sums have been bequeathed by individuals for the support of schools, particularly in the parishes of Balmacellan, Dalry, and Borgue. In addition to the parish schools, there are many voluntary seminaries, about $6\frac{1}{2}$ per cent of the whole population being at school.

The people are distinguished for their religious character. The Reformation began here at a peculiarly early date, namely, the beginning of the fifteenth century (*Literary History of Galloway*, p. 61), and some of the most eminent reformers and covenanters were connected with this county. The persecution in the times of Charles I. and his son Charles II. raged most hotly here. The graves of martyrs are to be found, not only in almost every churchyard, but even in many of the wildest moors. Presbyterianism still continues predominant. In addition to twenty-eight parish churches, there are three chapels of ease belonging to the establishment; seven churches in connection with the United Presbyterian Synod; thirteen Free Churches; one belonging to the Reformed Presbyterian Synod (Cameronians); one Episcopalian place of worship, and four Roman Catholic chapels.

The stewartry could boast of a greater number of monasteries than any other county in Scotland. These were Dundrennan, St Mary's Isle, and Tongland, founded in the twelfth century by Fergus, Lord of Galloway; Lincluden, by his son Uchtred; and Sweetheart, or New Abbey, founded in the thirteenth century, by Dervorgille, daughter of Alan, last Lord of Galloway, and mother of John Baliol, the competitor for the throne. Of Dundrennan, Lincluden, and New Abbey, the remains are comparatively entire; while the vestiges of the other two have nearly disappeared.

The bishopric of Galloway (*Candida Casa*), both in Catholic and in Protestant times, comprehended the stewartry and Wigtonshire. It formed the most ancient see in Scotland; and in dignity was inferior only to the archbishopric of St Andrew's and Glasgow, till, in 1633, when Edinburgh was erected into a bishopric, and obtained the preference over Galloway. The bishops of Galloway were *ex officio* deans of the chapel royal of Stirling.

Some eminent men have been connected with the stewartry, as Thomas Gordon, the translator of *Tacitus*; Robert Heron, author of a *History of Scotland* in six vols.; Dr Alexander Murray, the celebrated linguist; and Dr Thomas Brown.

The occupations of the people are mainly agricultural, as there are now, properly speaking, no manufactures; the cotton mills at Gatehouse, though many years in operation, having been discontinued. Exclusive of the landed gentry, there are fully two hundred capitalists not employed in any business. The rest of the population are engaged in such retail trades and handicrafts as are needful to supply the provincial demand. In the beginning of the present century there was only one bank (then recently introduced) in the county. Now there are no fewer than a dozen. At the same date there were only four lawyers; now there are fourteen, and one messenger-at-arms. The harbours in the stewartry belong to the customs ports either of Dumfries or Wigton; and the dues levied last year on ships, or on goods carried in ships, were as follows:—Kirkcudbright, L.340; Dalbeattie, L.28; Barlochan or Palnackie, L.25; Gatehouse, L.20. It may be remarked, that a considerable portion of the shipping trade of the stewartry (as also of its banking business) centres in Dumfries. The chief exports are grain, black cattle, sheep, and wool; the principal imports are coal, lime, timber, and iron.

It has already been stated, that the mountainous districts of the stewartry are composed of granite. A granite quarry

was opened in 1830, on the estate of Cassencurrie, in the parish of Kirkmabreck, by the Liverpool Dock Company. This is at present the most important work of the kind carried on in Scotland. About 300 workmen are daily employed in it; machinery of a kind previously unknown in Galloway has been introduced; a railway has been constructed connecting the quarry with Wigton Bay, a distance of about half a mile; and a new harbour has been built at the expense of the company, the vessels belonging to which transport the stone from thence to Liverpool. Besides defraying surface damage for the line of the railway, the company pay to the landlord a sum proportional to the produce of the quarry; and thus a piece of land, which was previously covered with rock or heath, and literally worth nothing, certainly not twenty shillings, now realizes an annual rent of about L.400.

Abstract of the Population at different times.

Years.	Houses.		Persons.		Total of Persons.
	Inhabited.	Not Inhabited.	Males.	Females.	
1811	6223	196	15,788	17,896	33,684
1831	6441	146	18,869	21,621	40,590
1851	7009	225	20,223	22,898	43,121

The stewartry sends one member to parliament, the constituency in 1855 amounting to 1277. In the election for the burghs, Kirkcudbright (which contains 99 electors) joins with Dumfries, Sanquhar, Annan, and Lochmaben; and New Galloway (which contains 12 electors) with Wigton, Stranraer, and Whithorn. (T. M.)

KIRKCUDBRIGHT, the chief town of the shire of that name, a royal and parliamentary burgh of Scotland, on the left bank of the Dee, about 5 miles from its embouchure in the Solway Frith. It is finely situated and well built; and the harbour is excellent, with depth for the largest vessels. Steamers ply regularly to Liverpool, but the trade of the town is small. Kirkcudbright unites with Dumfries, &c., in returning one M.P. Pop. 2778.

KIRKBY, a prefix to the names of several English towns and parishes indicating the site of a church.

KIRKBY-LONSDALE, a market-town of England, county of Westmoreland, on the right bank of the Lune, 11 miles S.E. of Kendal. It is well built of freestone, and has a fine church, with a tower and peal of bells, and a free grammar school, with 6 exhibitions to Christ's College, Cambridge. Pop. 1675. The Earl of Lonsdale takes his title from this place.

KIRKHAM, a market-town of Lancashire, on the Preston and Fleetwood Railway, 8 miles W.N.W. of Preston. It is a place of considerable antiquity, and has a free grammar school of 1658. Pop. 2777, chiefly employed in sailcloth, sacking, and cotton manufactures.

KIRKINTILLOCH, a burgh of barony, and market-town of Dumbartonshire, on the Edinburgh and Glasgow Railway, 7 miles N.N.E. of Glasgow. Pop. 6342, employed in handloom weaving (chiefly lappets), calico printing, bleaching, &c.

KIRK-KLISIE (*The Forty Churches*), a town of European Turkey, province of Roumelia, on a slope at the foot of the Balkan, 32 miles E.N.E. of Adrianople. It is a large but poor place, with ruinous walls and citadel, narrow and dirty streets, and abundant mosques. It is famous for the manufacture of a sweetmeat "composed of the inspissated juice from boiled grapes, formed into rolls containing walnut kernels."

KIRKOSWALD, a parish and village of Ayrshire, 11 miles S.W. of Ayr, containing the ruins of Crossraguel.

Kirkwall
||
Kirwan,
Richard.

Abbey, and of Turnberry Castle, Colzean Castle and Coves, and the farm of Shanter. Burns, for a few months, attended the village school; in the churchyard are buried the prototypes of Tam o' Shanter and Souter Johnny.

KIRKWALL, a royal and parliamentary burgh of Scotland, the principal town in the Orkneys, is situated in the S.E. side of a large and well-sheltered bay in the island of Pomona. It consists mainly of one long, narrow, and somewhat dirty, though venerable-looking street, most of the houses being built in the old style, with solid walls, small irregular windows, and gables facing the street. Another street parallel to this is more modern in appearance. The chief ornament of the town is the cathedral of St Magnus, a stately cruciform building, 236 feet long by 56 in breadth, and 71 in height. It was founded in 1138 by Earl Ronald, and is early Norman in its most ancient part. The choir was lengthened by Bishop Stewart in the reign of James IV., and the nave by Bishop Reid in the reign of Queen Mary. These additions are less purely Norman than the old part. The choir has long been used as the parish church; and recently the building underwent a thorough repair by order of Government. Near it are the ruins of the Bishop's palace, in which King Haco of Norway died of a broken-heart, and of the Earl's palace, built by the ambitious Patrick Stewart, last feudal Earl of Orkney. Among the other public buildings are a town-hall and assembly rooms; there are two libraries, and a grammar school endowed by Bishop Reid. The port is chiefly frequented by coasters and passing ships from Norway and the Baltic. The principal exports are cattle and fish. Steamers ply regularly to Leith. The burgh contributes with Wick in returning one M.P.; constituency (1856) 109. Pop. (1851) 3541.

KIRRIEMUIR, a burgh of barony and market-town of Scotland, Forfarshire, 5 miles N.W. of Forfar. It is well built, and has five churches, several schools, two libraries, &c. Pop. 3518, principally employed in the manufacture of brown linen.

KIRWAN, RICHARD, an eminent chemical philosopher, was born in the county of Galway in Ireland. The date of his birth is not known, but it probably fell within the first quarter of the eighteenth century. At an early age he was sent to the Jesuit college at St Omer, in the N. of France, to be trained for the study either of law or medicine. Before he left college, the death of his elder brother put him in possession of the family estate. He immediately gave up all thoughts of professional life, and devoted himself heart and soul to his favourite sciences of chemistry and geology. Removing to England in 1779, he settled in London or its neighbourhood; and being admitted into the Royal Society, he read many valuable papers before that body, for which, in 1781, he was rewarded with the Copley Gold Medal. After an absence of ten years he returned to Ireland in 1789, and was made President of the Royal Irish Academy, and of the Dublin Society, and published various essays from time to time on his own special branches of science, and also on logic and metaphysics. He died in 1812, at a very advanced age, having for many years been looked upon as the Nestor of English chemistry.

Though Kirwan devoted his whole life to scientific inquiry, and was contemporary with Cavendish, Lavoisier, Black, Scheele, Priestley, and the fathers of modern chemistry, he did not advance the boundaries of the science by any great discovery of his own. One of the earliest of his works was his *Essay on Phlogiston and the Composition of Acids*, in which he endeavoured to reconcile the old chemistry with modern discoveries. He maintained that hydrogen, or, as it was then called, *inflammable air*, was the true phlogiston, and that every combustible substance, and every metal, contained this inflammable air as a constituent, and that combustion is just the combination of it with the vital air. At the same time, he ad-

mitted the truth of Lavoisier's theory that, during combustion, oxygen unites with the burning body; and he could not deny the experiment of the decomposition of water, though, in point of fact, it was inconsistent with his own theory of phlogiston. His book was then laid hold of by the French chemists, as affording them an excellent opportunity of showing the superiority of the new doctrines to the old. It was translated into French, with a refutation at the end of every chapter by Lavoisier, Guyton-Morveau, Monge, Berthollet, Laplace, and others. These refutations, though quite irrefragable, were so skilfully and courtously worded, that Kirwan, with a candour and liberality unfortunately too rare, abandoned phlogiston and adopted the theory of his opponents.

In 1794 Kirwan published his *Elements of Mineralogy*, in 2 vols. 8vo, a work of great merit for its day, though now quite superseded. His *Geological Essays* were less successful; but his *Essay on the Analysis of Mineral Waters* was useful, both for the number of analyses which it contained, and for the method of procedure which it inculcated. Kirwan was also the author of numerous papers in the *Transactions* of the Royal Society and of the Royal Irish Academy, on subjects connected with mineralogy and meteorology as well as chemistry.

KISCHINEFF, or **KISCHENAW**, a town of European Russia, capital of Bessarabia, on the Byk, a tributary of the Dniester, 49 miles N.W. of Odessa. It has been greatly improved and enlarged since it came into the possession of Russia (1812), and contains numerous churches and schools, an ecclesiastical college, library, gardens, fountains, &c. The trade, chiefly in agricultural produce and manufactures (woollens, leather, candles, soap, &c.), is considerable. Pop. (1849) 42,613, consisting of Russians, Turks, Jews, Greeks, Armenians, &c.

KISFALUDY, the name of two brothers of distinguished fame in the history of Hungarian literature. Sandor, or Alexander Kisfaludy, was born at Sümeg, in the county of Szalad, in 1772, and died there in 1844. His countrymen are unanimous in assigning to him the highest place among the modern lyrists of Hungary. His younger brother, Karoly or Charles, was born at Tete in 1788, and died in 1830, at the early age of 42. He attained in tragedy a distinction similar to that which his brother achieved in lyric poetry. See **HUNGARY**, § *Literature*.

KISHENAGUR, a town of Hindustan, in the province of Rajpootana, 13 miles N.E. from the city of Ajmeer. It is the capital of a small but independent principality of the same name. The rajah is of the Rhatore tribe. Kulliam Singh Rajah, of Kishenagur, entered into a treaty in 1818 with the British government, acknowledging their supremacy. Some years later serious disturbances occurred within his dominions, which he was unable to quell; and eventually, in 1832, he abdicated in favour of his son, and retired within the British territories. The town of Kishenagur is in N. Lat. 26. 33., E. Long. 74. 57.

KISHM, the largest of the islands in the Persian Gulf, lies along the coast opposite the Straits of Ormuz, about 10 miles S.W. of Gombroon. It is between 50 and 60 miles long, with a breadth of 12 miles, sterile for the most part, and in the S. hilly, but with considerable tracts of fertile land, producing wheat, rice, cotton, dates, grapes, &c. Pop. about 5000, chiefly occupied in agriculture, rearing cattle, fishing, and cotton-weaving. There are three small towns in the island, the principal of which, Kishm, on the E. side, is walled, and has a well-sheltered but shallow harbour, much frequented by coasting vessels.

KISHTEWAR, a district of Hindustan, in the dominions of Gholab Singh, the ruler of Cashmere, situated principally between N. Lat. 33. and 34. It is bounded on the N.W. by the southern range of the Cashmere Hills. The country is in general hilly and covered with wood, and

Kischineff
||
Kishtewar.

but thinly inhabited. It is also very cold during the winter season, and presenting few temptations to invaders, has probably on that account retained its independence. It is intersected by the River Chunaub, over which there are no bridges; and at the village of Nausman, where it is 70 yards wide, it is crossed by means of a large basket slung on a tight rope, which reaches from side to side, and along which it is pulled. Kishtewar, the capital, which is the residence of a Mohammedan chief, is situated close under the southern range of the Cashmere Mountains. N. Lat. 33. 18., E. Long. 75. 46.

KISSINGEN, a well-built and pleasantly situated watering place of Bavaria, circle of Lower Franconia, on the Saale, 32 miles N. of Wurzburg. It has three saline springs (the *Rakoczy*, *Pandur*, and *Max-Brunnen*), much recommended for chronic diseases, gout, and stomach complaints. The number of visitors annually is about 4000. Between 400,000 and 500,000 bottles of the water are exported. Pop. about 1500. A little farther up the valley are the government salt works, supplied by Artesian wells, which have a regular rise and fall. One of these is about 2000 feet deep, and discharges, at intervals of three or four weeks (the discharge lasting about the same time), a column of water 80 feet high, at the rate of 100 cubic feet per minute. The propelling force is a stratum of nearly pure carbonic acid gas. The quantity of salt held in solution is from 26 to 27 per cent. The yearly product of these springs is about 1500 tons of the finest salt.

KISTNAH, or KRISHNAH, a celebrated river in the S. of India, which has its source in the Western Ghauts, not far from Sattarah, in the province of Bejapoor, which is only 50 miles in a direct line from the western sea-coast. It proceeds from hence in a south-easterly direction until it reaches Merritch, when its bulk is greatly increased by the junction of the River Wurna, formed by a variety of streamlets that fall from the Ghauts. During its course eastward it is joined by the Malpurba, Gutpurba, Beemah, and Toombuddra rivers, and pours its prodigious volume of waters, by various mouths, into the Bay of Bengal, at or a little to the southward of Masulipatam, where it forms the northern boundary of the Guntoor Circars. Its course, including its windings, may be estimated at 800 miles in length. The Kistnah is subject to two periodical inundations annually, the first and principal being caused by the S.W. monsoon, and the other by the local rains brought by the N.E. monsoon. In consequence of the rapid declivity of its waterway and rockiness of channel, this river cannot be navigated, even by small craft. An extensive system of irrigation, in connection with this great stream, is now in progress, and is estimated to cost L.150,000. The object is proposed to be effected by means of an embankment thrown across the river at the head of the Delta, and by thus accumulating the waters, to extend the benefits of irrigation to large portions of the districts of Masulipatam and Guntoor. The term Krishnah signifies black, or dark-blue, and is the name of the favourite deity of the Hindus, an incarnation of the preserving power of Vishnu. This river forms the boundary of the Deccan, according to the best Mohammedan authors.

KIT-CAT-CLUB, a convivial association which came into existence in London about the time of the Revolution. From the Whig leanings of most of its members, it gradually assumed a political character. Addison, Steele, Walpole, Marlborough, and others who belonged to it, were the fast friends of the Hanoverian succession; and it is principally through the portraits of these distinguished men, as members of the club (painted by Sir Godfrey Kneller, himself a member), that the fame of these reunions has been handed down. It was held in Shire Lane, in the house of Christopher (Kit) Cat, a pastry cook, who supplied them with mutton pies. The club dissolved somewhere about 1720.

KITTO, JOHN, the editor of the *Pictorial Bible*, and other works connected with Biblical literature, was born at Plymouth, December 4, 1804. His father was a mason, the son of a Cornish miner. In early life he bore a good character, but fell into habits of intemperance, which soon reduced his family to penury. John was his eldest child. He was a puny infant; his muscular frame was feeble, and unfitted him for the active games of boyhood. An aged grandmother, whose memory was charged with all the nursery lore of her times, was his first instructor, and found in him an apt and eager scholar. The only schooling he received was of the most ordinary kind, and for a short period; and this was rendered less efficient by a change of masters, and frequent headaches. Books, however, were a necessity of his life, and the pangs of hunger were more endurable than a scanty supply of mental food. When not twelve years old he began to write tales, and framed the plot of a tragedy, which he enacted with some of his companions. In his thirteenth year an event occurred which, though not fatal to his life, seemed to blast all his prospects of literary eminence or improvement. He had been accustomed to help his father as a jobbing mason, and on February 17, 1817, when engaged in repairing the roof of a house, he lost his footing, and fell from a height of 35 feet upon a stone pavement. His limbs were not broken, but a permanent injury was done to the skull, and the sense of hearing was totally destroyed. After eight months his general health was restored, but with "knowledge at one entrance quite shut out," a melancholy drawback, as it seemed, from the value of all the rest. Unable any longer to assist his father, he was allowed to occupy his time in whatever way he felt inclined. One of the expedients he adopted to raise a little fund for the purchase of books was that of wading at low water in Plymouth harbour in quest of yarn and old iron, by which he earned about threepence per week. When disabled by an accident from this gainful employment, he tried his hand at some rude drawings, more gaudy than truthful, which he disposed of to the children in the neighbourhood. He also prepared coloured labels in capital letters for the use of small shopkeepers or persons who let lodgings. Thus two or three years passed till he had nearly completed his fifteenth year. No resource seemed left for him but the workhouse, into which he was admitted November 15, 1819. The officers of the place, who were intelligent, worthy men, encouraged Kitto's taste for literature, and relaxed the rules of the workhouse in his favour. A journal which he began to keep about this time is a most interesting document, marking "the growth of an individual mind," and revealing the elements of the strong character that was in due time to be developed. After having learnt the art of making list shoes, a shoemaker in Plymouth offered to take him as an apprentice; but he proved to be an overbearing and inhuman tyrant on the small scale. Poor Kitto was goaded by his insults almost to madness and suicide. An appeal was made to the magistrates; his indentures were cancelled, and he obtained an order for readmission into the workhouse. A gleam of light now fell on his prospects. He attracted the notice of several literary and benevolent persons by some short essays, which were inserted in a local journal. A small fund was raised for his temporary support, and he was placed with Mr Burnard, the clerk of the guardians, to board and lodge, with the privilege of spending the day at the public library, where he prepared a small volume of miscellanies, which was published by subscription. Shortly after, Mr Groves, a dentist at Exeter, but who formerly resided in Plymouth, became acquainted with his history and circumstances; this gentleman offered to take him as gratuitous pupil, and to allow him a sum for his personal expenses. In a short time he became so far a proficient in dentistry, that, when his patron was preparing

Kitto,
John.

to go abroad on a Christian mission to Persia, Kitto thought of entering on the practice of that art in his native place, or engaging himself as an assistant to a London practitioner. But by this time his religious convictions had been greatly deepened, and he cherished a wish to be employed in connection with missionary undertakings. A vacancy occurring in the printing-office of the Church Missionary Society, Kitto was chosen to fill it. Here he remained, a short interval excepted, for nearly two years, when he went to the Society's establishment at Malta. After being in that island little more than six months, the hopes he had cherished of a domestic union were suddenly crushed, and brought on a severe illness—and this, in addition to some points of disagreement between himself and the Society, led to his return to England in the beginning of 1829, when he accepted the office of tutor to Mr Groves's two sons. He accompanied Mr Groves to Bagdad, the proposed seat of his mission, by an overland route, passing through St Petersburg, Moscow, and Astrakan. They reached their destination in December 1829. During his residence, within the short space of three years, he witnessed a siege, an inundation, the plague, and famine. At Bagdad, however, and in the travels that preceded and followed his sojourn there, he laid the foundation of his future literary eminence, and acquired, by personal observation, that knowledge of oriental life which fitted him for the great work of illustrating the Sacred Scriptures.

After the ravages of the plague, the missionary establishment was broken up. In September 1832 Kitto returned home by way of Teheran, Tabreez, Trebizond, and Constantinople. From the last named place he sailed for England, and reached Stangate Creek exactly four years after embarking at Gravesend for St Petersburg. When in sight of his native shores, he exclaimed, "Give me a little house—a little wife—a little child—and a little money in England, and I will seek no more, and wander no more!" On arriving in London he was introduced to some members of the Society for the Diffusion of Useful Knowledge, and was thus brought into connection with Mr Charles Knight. By this liberal-minded publisher he was engaged to assist in the various serial publications of the Society, and at last to prepare works of which he was the sole author. Of the latter class the most important were the *Pictorial History of Palestine* and the *Pictorial Bible*, and the last-named work is that on which his reputation is chiefly founded. Henceforward, Kitto's life was one of incessant labour. His working day was generally sixteen hours long; and though his deafness excluded him from much social enjoyment, it was not without its advantages, in producing a concentrated and unbroken attention to his literary pursuits. The *Cyclopædia of Biblical Literature*, in which he obtained the co-operation of forty scholars, British, American, and German, has superseded every previous work of the kind, and placed biblical literature on a level with the advanced scholarship of the present day.

His *Daily Bible Illustrations*, in eight small 8vo volumes, is a worthy companion of the *Pictorial Bible* and the *Cyclopædia*. But with this his life's work was done. On the morning after he had finished it he was seized with a slight paralytic stroke, and from that time was incapacitated for literary labour. Absolute rest alone afforded the slightest chance of recovering health, or even prolonging life. But his incessant toil had proved barely adequate to meet the daily wants of a large family, even with the addition of £100 per annum, granted in December 1850, from the Royal Civil List. By the exertion of some of his friends, a fund was raised to enable him to go abroad, and to make some provision for his family in the event of his decease. In the autumn of 1854 he and his family removed to Canstatt, in Württemberg. Within a few weeks after

their arrival his youngest child sickened and died, and was soon followed by his eldest daughter, a young person of great promise. He bore these bereavements with exemplary resignation, but regarded them as premonitory of his own approaching decease. On the 25th of November he was seized with a fit, which speedily proved fatal. His remains were interred in the churchyard at Canstatt, near those of his children. Besides the works already mentioned, Dr Kitto wrote *Uncle Oliver's Travels*, 1838; *History of Palestine*, 1843; *Thoughts among Flowers*, 1843; *The Pictorial Sunday Book*, 1845; *The Lost Senses, Deafness and Blindness*, 1845; *Pictorial Life of our Saviour*; and several smaller works. The *Journal of Sacred Literature* was founded by him in 1848. (Ryland's *Memoirs of Kitto*, Edin. 1856, and *Eclectic Review*, May 1856.) (J. E. R.)

KITZINGEN, a town of Bavaria, circle of Lower Franconia, on the right bank of the Main, which is here crossed by a handsome bridge, connecting the town with the suburb of Etwashausen, both of which are surrounded with walls flanked by towers. It is generally well built, carries on an active trade, and has manufactures of cotton, vinegar, gunpowder, and dye stuffs. Pop. 5170.

KIU SIU. See JAPAN.

KIZILERMAK. See HALKS.

KIZLIER, a fortified town of Russia, government of Caucasus, on the left bank of the Terek, about 60 miles from its mouth, on the Caspian. It carries on a considerable trade, being an *entrepôt* for the traffic between Persia, Astrakan, and the interior. Its exports comprise wine, brandy, silk, oil of sesame, &c. Pop. (1849) 11,200.

KLAGENFURT, a town of Austrian Illyria, capital of the duchy of Carinthia, on the Glan, 40 miles N.N.W. of Laybach. It is a dull, old-looking town, and was formerly surrounded by walls and ditches, but these were destroyed by the French in 1809, and their site is now occupied by a promenade. The streets, however, are wide and regularly built, and there are five public squares, one of which has a leaden statue of Maria Theresa. The town has many handsome buildings, among which are the palaces of the prince of Rosenberg and of the bishop of Gark, the latter of which contains fine collections of paintings, statuary, and minerals. The *Landhaus*, or House of Assembly for the estates of Carinthia, was built as early as 1391. The old castle, or *burg*, is an interesting building. One of the churches is remarkable for its fine tower, commanding an extensive view of the surrounding country. Klagenfurt has a normal school, lycæum, gymnasium, and other educational institutions, two hospitals, lunatic asylum, theatre, and public library of about 45,000 volumes. It has also the largest white-lead manufactory in the empire. The principal of its other manufactures are woollen and silk fabrics. It carries on an extensive transit trade. A canal 3 miles in length connects the town with Lake Wörth. Pop. 14,200.

KLAPROTH, JULIUS HEINRICH VON, one of the most illustrious of modern orientalists, was the son of the famous chemist, Martin Heinrich Klaproth, and was born at Berlin in 1783. His father's desire was to train him to his own profession, but at a very early age his instincts led him to study the eastern tongues, and in his zeal for them he neglected everything else. So completely was he absorbed in them, that, when he was called up for examination by the master of the gymnasium, he failed to answer the simplest questions, "You know nothing, then?" said his examiner. "Sir, I know Chinese," was the reply. "Chinese! who taught you?" "No one; I learned it alone." He brought forward the most indubitable proofs of the truth of his statement, and his father, vexed as he was to see his pet scheme thwarted, agreed to let his son take his own way. In 1801 he sent him to Halle, on the ex-

press condition that he would there master the classical languages. In a few months the young Klaproth exhausted the resources of the place, and in 1802 removed to Dresden, publishing in that year the first number of his *Asiatisches Magazin*. Among others who were amazed by the erudition of the young philologist was the learned Count John Potocki. By his interest Klaproth was admitted into the service of Russia, and in 1804 was called to St Petersburg, where he joined the Academy of Sciences as associate for the languages of Asia. Next year, when it was determined to send an embassy to Peking, Klaproth was fixed upon as the interpreter of the party before even the ambassador was selected. The choice at last fell upon Golowkin, while Potocki was charged with the scientific part of the expedition. These arrangements were still pending when Klaproth set out alone to make observations in the less known parts of the Russian empire. Passing by Cazan and Perm, he crossed the Ural Mountains, reached Ekaterinburg, followed the course of the Irtysh from Tobolsk to Omsk, crossed the great steppes to Tomsk, and thence to Irkutsk, near the shores of the Lake Baikal, the rendezvous of the embassy. His object in taking this circuitous route was to visit the Finnish and Tartar tribes of Siberia, and study their manners, languages, and ethnology. From Kiachta they crossed Mongolia to the Chinese frontier, but had only advanced a very short way into the country when they learned that the emperor had refused to receive them. Golowkin, a weak and haughty man, had declined to go through the ordinary forms of the Chinese court ceremonial, and his obstinacy defeated the whole purpose of the embassy. Leaving his companions to return home as they chose, Klaproth spent some months in wandering among the savage tribes of Southern Siberia, studying their languages and customs. After an absence of twenty months he returned to St Petersburg in the spring of 1807, and communicated to the Academy the results, both scientific and political, of his mission. So valuable were these considered, that, in the same year, he was again despatched to prosecute his inquiries in the Caucasus, and on his return in 1809 he was loaded with honours and rewards by the Russian government. He took rank among the nobility by being made a knight of the order of Vladimir. The emperor himself gave him the title of Aulic councillor, and the academy waived its usual formalities in making him an extraordinary member. Great as these distinctions were, however, they fell short of what Klaproth seemed to regard as his due; and when the government secretly suppressed his intended publication of his travels, he began to find his stay in St Petersburg uncomfortable. Leaving the capital, he retired to Wilna, and, at the request of the Prince Czartoriski, drew up the plan of a special course of the eastern languages, in connection with the university of that city. He also drew up a catalogue of the Chinese and Manchu books in the library, and in 1811 went to Berlin for the purpose of carrying it in person through the press. Here he tendered his resignation to the Russian government, though he knew that by so doing he forfeited all his honours, privileges, and pensions. Strange rumours got afloat as to the real reasons of this infatuated act. It was even whispered that some valuable manuscripts and foreign books had disappeared from the library, and that Klaproth knew more about them than he cared to tell. At all events, in 1812, his official connection with Russia closed for ever. His first care now was to publish his travels in the Caucasus; and he retired to Warmbrunn, a small village on the confines of Bohemia and Silesia, to continue his studies in peace and quiet. When the great continental wars again broke out in 1813, even this nook became an unsafe retreat, and Klaproth was obliged to fly. In his wanderings he became acquainted with some of the generals of Napoleon, and by them he was taught to admire the great em-

peror. So great indeed was his admiration, that when Napoleon was caged in Elba, Klaproth visited the island for the express purpose of beholding his idol. He was well received, and promised a place under government by the imperial prisoner if he should ever regain his throne. The promise was made in all sincerity; but during his second reign of the "Hundred Days" the emperor was too busy to remember it, and Klaproth retired to Florence, where he lived for a time in great straits. Returning to Paris in 1815, he there met his old friend Potocki, and by his advice resolved to establish himself there as a litterateur. By this means he obtained a scanty livelihood; but his prospects were gloomy indeed, when he had the good fortune to fall in with his countryman, William Von Humboldt. By this distinguished scholar, whose studies had lain very much in the same direction with his own, Klaproth was brought under the notice of the king of Prussia, and nominated royal professor of the Asiatic languages and literature, with a handsome salary. He was, besides, presented with a large sum of money to defray the cost of printing his works, and was allowed to remain in Paris so long as he thought fit. Thus provided for, Klaproth prosecuted his researches with renewed vigour, and it was after this date (1816) that he produced nearly all the works on which his fame depends. He had acquired at the Russian court a love of pleasure and refined society, and such time as he could now steal from his books and manuscripts was spent in gratifying this taste. In the intellectual and social excitements of Paris he was in his element, and he plunged into both with an ardour far beyond his strength. In 1833 frequent palpitation of the heart seemed to indicate that disease was sapping the centre of life. Symptoms of dropsy next began to show themselves. He derived a little benefit from a journey to Berlin in 1834, when he was received with open arms by the king of Prussia and the scholars of that country. On his return to Paris he again grew worse, and his malady was aggravated by occasional fits of mental alienation. All the medical skill of Paris was of no avail. After great and protracted suffering, he died August 27, 1835. His remains were followed to the grave, in the cemetery of Montmartre, by nearly all the learned and scientific men then in Paris. Conspicuous among them was Alexander Von Humboldt.

Since Klaproth's death his fame has continued to rise, and his works are now appreciated at their full value. His merits as a philologist are very great; but his merits as a linguist are greater still. It may be safely averred, that of the great linguists of his day (and they were many), none stood higher than he. His memory, both for comprehensiveness and accuracy, was unrivalled, and served him so well that most of his papers were written without other aids than that of an occasional note. His versatility and activity of mind were equally remarkable; and, though his style was often careless and incorrect, the substance of his writing was both clear and well arranged. In whatever he wrote he aimed at accuracy above all things, and so intolerant was he of errors, that, even when the mistake was committed by a personal friend, he looked upon it as a duty to expose the offender without mercy. To quackery and charlatanism, especially in his own proper walk, he was an implacable foe; and there never was any thing, in its own way, more complete than his exposure of a *Pretended Translation of the Works of Confucius from the Original Text, a literary imposition from the Works of Dr William Schott*. This pamphlet was written to expose the pretensions of Schott, who had given out that, to understand the text of Confucius, he had called in the aid of two learned Chinese recently arrived in Germany. The persons in question were indeed Chinamen, but the one had been a cook and the other a mechanic near Canton. When Dr Schott found them, they had been earning a scanty liveli-

Klaproth,
Martin
Heinrich.

hood by showing themselves for money in the various towns of Germany. The Prussian government had engaged them to teach their native tongue at Halle. Klaproth proved beyond a doubt that the pretended version of Schott had been taken, not from the original text, but from the English translation of Marsham, published at Serampore, the numerous inaccuracies of which had been exposed by the French orientalist Rémusat. The severity with which he punished the impostors was great; but he often showed a similar, if not equal rigour, in cases where it was by no means so well deserved. Indeed, the irascibility of his temper caused him to be hardly less dreaded by his friends than by his enemies.

Klaproth's works are very numerous; so numerous, that, in his life, by his friend Eyriès, in the *Biographie Universelle*, the mere enumeration of them occupies ten pages. Even this long list is far from exhausting them, and the reader is referred for further particulars to the catalogue of them prepared in 1839 by M. Merlin, a Parisian bookseller. The great majority of them, however, it must be remembered, are merely short essays, pamphlets, and review articles. The subjoined list contains the most important of them:—

Asiatisches Magazin, Weimar, 1802, 2 vols. 8vo, to which Klaproth contributed the most important papers; *Reise in den Kaukasus*, Halle and Berlin, 1812-14, 2 vols. 8vo, to which two supplements were afterwards added, one on the languages of the country, and another on the geography of the Eastern Caucasus; *Abhandlung über die Sprache und Schrift der Uiguren*, Paris, 1820, 8vo; *Archives de la Littérature, de l'Histoire, et de la Linguistique de l'Asie*, St Petersburg, 1810, 4to; *Supplément au Dictionnaire Chinois du Père Basil de Glemont*, Paris, 1819, fol.; *Asia Polyglotta*, Paris, 1823, 4to, in which the Asiatic nations are distributed according to their idioms, which are divided into twenty-three classes; *Mémoires relatifs à l'Asie contenant des recherches Historiques, Géographiques, et Philologiques sur les Peuples de l'Orient*, Paris, 1826-28, 3 vols. 8vo, with maps and plates; *Vocabulaire et Grammaire de la Langue Géorgienne*, Paris, 1827, 8vo; *Examen Critique des travaux de M. Champollion jeune sur les Hiéroglyphes*, Paris, 1832, 8vo; *Chrestomathie Mandchou*, Paris, 1828, 8vo; *Notice d'une Mappemonde et d'une Cosmographie Chinoises*, Paris, 1833, 8vo; *Lettre à M. le Baron A. de Humboldt sur l'origine de la Boussole*, Paris, 1834, in which he proves that the compass was in use among the Chinese many centuries before it became known to the western world; *Tableau Historique, Géographique, Ethnographique, et Politique, du Caucase et des provinces limitrophes entre la Russie et la Perse*, Paris, 1828, 8vo, a work which has often been laid under contribution by subsequent writers on that country. Among the many works which Klaproth edited, may be mentioned Guldénstädt's *Travels in Georgia and Imeritia*, and his *Description of the Caucasian countries*; Timkowski's *Voyage à Pékin à travers la Mongolie en 1820 et 21*, Paris, 1827, 2 vols. 8vo; Count Potocki's *Travels in the Steppes of Astracan and the Caucasus*, and his *New Voyage round the Euxine*, Paris, 1829, 2 vols. 8vo; Orazio della Penna's *Brief Notice of the Kingdom of Thibet*, Paris, 1835; besides many other works bearing chiefly upon Central Asia. His contributions to the periodical press of France and Germany would fill many volumes. Many of these, especially his papers in the *Biographie Universelle*, are in their way almost unique, and of very great value.

KLAPROTH, *Martin Heinrich*, a distinguished analytical chemist of Germany, was born at Wernigerode, in Upper Saxony, December 1, 1743. Intended originally for the church, he was sent to school to receive the preparatory training. The harsh treatment he met with gave him a distaste for study, and, bent on becoming an apothecary, he entered the public laboratory of Quedlinburg, where he spent seven years, chiefly in learning to manipulate. He then removed to Hanover, where he spent two years more in the public laboratory of the place. In 1770 he went to Danzig, whence he was recalled to Berlin to assist the famous Valentin Rose. On the death of that eminent chemist in the following year, Klaproth succeeded him in his various offices. In 1787 he was made a member of the Academy of Arts, and, in the following year, of the Academy of Sciences. A few years later he became

professor of chemistry in the Royal Mining Institute, and assessor in the Supreme College of Medicine and Health. He died at Berlin, January 1, 1817.

Klausthal.

The great value of Klaproth's labours lay in the skill with which he applied chemical analysis to minerals, chiefly with a view to their proper classification. It was thus that he discovered zircon in the jargon of Ceylon; that he demonstrated the presence of potash in volcanic productions; that he made known the sulphate of strontian; that he found potash in the leucite or white garnet; that he discovered in red schorl a new metal, which he named *titanium*, another in pechblende which he called *uranium*, and a third in the ore of white gold, to which he gave the name of *tellurium*. He also made known the molybdate of lead, and proved that the ore of red silver was a sulphuret of silver and antimony. Such are the most important of M. Klaproth's labours, those, in fact, which entitle him to rank amongst the most distinguished chemists of his age; but he published, besides, a considerable number of analyses of fossil substances, which may be found in the *Journal de Physique*, the *Annales de Chimie*, the *Journal des Mines*, and other collections of this sort. He also prepared a mineralogical system, which is mainly founded upon the constituent principles of minerals. His *Memoirs of Chemistry* have been collected and translated into French by Tassaert, Paris 1807, in two vols. 8vo. Lastly, he composed, in conjunction with Wolf, a *Dictionary of Chemistry*, in four vols. 8vo; a work which was translated into French by Bouillon-Lagrange and Vagel. Klaproth greatly contributed to advance the science of mineralogy, and his researches have thrown much light on the system of Werner, as well as on the classification of Haüy. His discoveries, and, above all, his particular means of analysis, have served to guide several French chemists, who are indebted to him for part, at least, of the fortunate results which have rewarded their researches.

KLARENZA, a village of the Morea, on a bay of the same name (the ancient *Cyllene*), about 15 miles from Zante. It has the remains of a mediæval fortress, from which the name of the dukedom of Clarence was long supposed to have been derived, the title being said to have come with Queen Philippa from the Hainault family, into which a daughter of the house of Clarence had married. Colonel Leake pronounces this opinion "unfounded," and says there can be no question that Clarence was the district of Clare in Suffolk. The title was first given by Edward III. to his son Lionel in 1362.

KLAUSENBURG (in Hungarian, *Colosvar*), a royal free town of Austria, the capital of Transylvania, on the Szamos, 72 miles N.N.W. of Hermannstadt. It is situated in the midst of a beautiful and fertile valley, surrounded by mountains, and consists of an inner town (subdivided into the old and the new), with walls, seats, and towers, and six suburbs. It has a fine old Gothic cathedral, besides churches and convents, an academical lyceum and library, Roman Catholic gymnasium, a Reformed and a Unitarian college, several hospitals, a theatre, public gardens, a ruined castle, and numerous palaces of the nobility. The trade and manufactures are unimportant. Pop. in 1846, 25,500, consisting of natives of Saxon descent, Hungarians, Germans, Armenian Greeks, Jews, &c., all enjoying equal rights. Klausenburg is supposed to occupy the site of the *Claudia* or *Claudiopolis* of the Romans, upon which a Saxon colony founded a new or enlarged city in 1178. King Matthias Corvinus was born here.

KLAUSTHAL, the principal mining town of the Harz district, Hanover, is situated on the top and sides of a bleak hill, at an elevation of 1860 feet, 25 miles N.E. of Göttingen. A small stream, called the Zellerbach, over which there is a bridge, divides it from the village of Zellerfeld. It contains a mint, where the precious metals of the dis-

Klopstock
||

borough.

trict are assayed and coined, a mining-school (for the free education of young miners, with a large collection of models of machinery, &c., and a cabinet of minerals, a gymnasium, &c. Pop. 9070; of Zellerfeld, 4176, chiefly employed in, or in connection with, the mines, a few also in manufactures of iron-ware, woollen cloths, yarn, &c. The neighbouring mines employ above 2000 workmen; one of them, the *Georg-Wilhelm*, descends below the sea-level. A subterranean canal, above $2\frac{1}{2}$ miles long, conveys the ore from some of the shafts, and they are all drained by a subterranean tunnel 6 miles long. The whole machinery of the mines is moved by water-power, and all the streams of the neighbourhood are carefully husbanded for this purpose.

KLÖPSTOCK, FRIEDRICH GOTTLIEB, was born July 2, 1724, at Quedlinburg in Prussian Saxony, and was educated first at the gymnasium of that town, and afterwards at the Schulpforte, near Naumburg. Here he paid great attention to the ancient classics, and formed the resolution of writing a great epic poem. The choice of a subject perplexed him; but at this time the reign of the Emperor Henry I., known as Henry the Fowler, seems to have attracted him most. In 1745 he studied theology at Jena, and commenced in solitude the first canto of his *Messiah*. In Leipzig, where he went next year, he formed an acquaintance with Cramer, Schlegel, Rabener, Zacharia, and others, who were then publishing the *Bremische Beiträge*. The first three cantos of the *Messiah* appeared in this periodical in 1748, and excited universal attention. They made a still greater impression in Switzerland; and, when their author visited that country in 1750, the people looked upon him with a sort of veneration. In Denmark, too, they met with a very favourable reception; and Klopstock was invited to Copenhagen by the minister Bernstorff, with a small pension to finish the poem. Setting out in 1751, he travelled through Brunswick and Hamburg, and in the latter city made the acquaintance of Meta Møller, whom he married in the summer of 1754. The steps by which his acquaintance with this lady ripened into love are described with great beauty and simplicity in his well-known letters, written, when she had become his wife, to Samuel Richardson, and afterwards published in that novelist's correspondence. Four years after his marriage he had the misfortune to lose his wife, who died in childbed in 1758. From 1759 to 1766 he resided alternately at Brunswick, Quedlinburg, and Blankenberg, and afterwards at Copenhagen. In 1764 he published his *Hermann's Schlacht* (Battle of Arminius), and sent it to the Emperor Joseph, but not with the success which, in his patriotic enthusiasm, he had promised himself. After this he entered upon his investigations into the German tongue. In 1771, after the dismissal of Bernstorff, Klopstock left Copenhagen for Hamburg, as secretary to the Danish legation, and counsellor of the Margraviate of Baden. In Hamburg he finished the *Messiah*. In 1792 he married a second time. His principal amusement in winter was skating; and he was more than once in imminent danger of losing his life by it. He died March 14, 1803. His body was buried with great pomp and solemnity in the presence of thousands of spectators. A complete edition of his works was published at Leipzig, in 12 vols. 4to, 1798-1817; and they have been since reprinted in a 12mo form. The hundredth anniversary of his birth was celebrated at Quedlinburg and Altona, July 2, 1824. A monument has been erected in his honour in the former town. (For a critique on his style and works, see POETRY.)

KNARESBOROUGH, a market-town and parliamentary burgh of Yorkshire, W. Riding, 18 miles W. by N. of York. It is finely situated on a rocky slope on the left bank of the Nidd, which is crossed by two bridges, and is well built, chiefly of stone, with good streets, and a spacious market-place. It contains a handsome old Gothic

church, a free grammar school, and a literary institute, with a small library. Its manufactures of cotton and linen have greatly declined. The borough has returned two members to parliament since 1553; constituency (1856) 252. Pop. (1851) 5536. Knaresborough Castle, now in ruins, was founded in 1170 by Serlo de Burgh; it was a fortress of great strength. On the opposite bank of the river is the "Dropping Well," a petrifying spring. Further down the valley are several objects of antiquarian interest, among them is St Robert's Cave, the scene of the murder by Eugene Aram, who was a schoolmaster in the town.

KNELLER, SIR GODFREY, a celebrated portrait painter, was born at Lubeck in 1648. He studied first in the school of Rembrandt, and on the death of that great master became a pupil of Ferdinand Bole. In due time he set out for Italy to perfect himself in his art. At Rome, and more especially at Venice, he gained himself a considerable name, both by his historical pieces and portraits. During the latter part of his stay he had more commissions than he could execute. Leaving Venice, he settled for a time at Hamburg, where he became even more popular than he had been in Italy. On the invitation of the Duke of Monmouth he crossed over to England, and was introduced to Charles II. The "merry monarch" was so pleased with him that he sat to him for his portrait several times. On the death of Sir Peter Lely he found himself without a rival in England. Appointed court painter by Charles II., he held that office under James II., William III., Anne, and George I. The last named king made him a baronet, the Emperor Leopold I. created him a knight of the Roman empire, and he received similar compliments from other European princes. Till the last his industry continued unabated; and as he was frugal, even to avarice, he was able to amass a very large fortune. He died in 1723, in his seventy-sixth year.

Kneller's fame, great as it was in his own day, has not very successfully stood the test of time. His colour, always brilliant, is deficient in truthfulness; and a strong mannerism is conspicuous in many of his pictures. From a habit which he had of lengthening the oval of all his heads, there is a kind of monotony throughout his portraits. Though, on the whole, he was quite unequal to his predecessor Lely, many of his separate pieces rival his, both in loftiness of conception and force of colouring. Kneller's works are confined almost entirely to England, not more than one or two specimens having ever found their way abroad. Dr Waagen, in his *Art Treasures of Great Britain*, gives a list of his best works, with the galleries in which they hang. See PAINTING.

KNIGHT, RICHARD PAYNE, author of an essay on the *Principles of Taste*, and a distinguished patron of art and learning in England, was born at Wormsley Grange, in Hereford, in 1750. From an early age he devoted himself to the study of Greek literature and antiquities. On his father's death he succeeded to a princely fortune, of which he devoted a large proportion to the purchase of antiques, especially Greek coins and bronzes. He continued collecting till his death, in 1824, and bequeathed his magnificent cabinet (valued at L.50,000) to the British Museum. Of his numerous works, the most generally interesting is his *Analytical Inquiry into the Principles of Taste*, which, though severely reviewed by the periodical press, and especially by the *Edinburgh Review*, passed through several editions. He maintained that the most important, and, indeed, the only considerable part of beauty, depended upon association, though he insisted that there is a beauty independent of association, prior to it and more original and fundamental—the primitive and natural beauty of colours and sounds. (See art. BEAUTY.) His other works were—*An Account of the Remains of the Worship of Priapus lately existing at Isernia, in the Kingdom of Naples*; an

Kneller
||
Knight.

Knights. *Analytical Essay on the Greek Alphabet*, 4to, Lond. 1791; and three poems, *The Landscape*, 1794; *The Progress of Civil Society*, 1796; and the *Romance of Alfred*, in 1823. He also contributed to the *Edinburgh* and other reviews. His prose works all exhibit learning and acuteness, which, if bestowed on subjects other than whims and hobbies, might have made him a lasting name among the scholars of Great

Britain. His poems have not the slightest shadow of a claim to that title. There was probably no kind of composition for which their author was not better fitted than poetry. **KNIGHTON**, a small market-town, municipal and parliamentary borough of Radnorshire, picturesquely situated on the Teme, 8½ miles N.N.E. of the county town, to which it is a contributory borough. Pop. 1388. **Knigton**
||
Knights.

KNIGHTS AND KNIGHTHOOD.

In the days of the Roman Empire, the exercise of arms was a profession. In the confusion which followed on the breaking up of that vast dominion, the profession of arms became an inheritance. The lord of land had to defend what he held from other lords who coveted it. As Christian civilization and social law prevailed, the profession of arms once more became a mere exercise. In the rude transition state of society, every man with property to lose, was necessarily a man-at-arms, ready to defend it; they who were less wealthily endowed assumed arms and sold their services. The sons of a noble family had, indeed, choice of but two vocations—they naturally went to the camp or the cloister; sometimes they commenced with the first, and when weary of their calling, sought retirement in the latter. The Christian knight was a grand idea; but he was often only an idea, too seldom a realization; his professions were, with very rare exceptions, better than his practice,—and even Bayard, eminent for his religious zeal, does not seem to have been a truer knight than Æneas, whose most resplendent title was drawn from his piety.

Apart from Christianity, the knight (in his character of warrior) may be said to have existed in all times. He who gave the first challenge to a duel,—the youthful David, who summoned and slew the gigantic Philistine, was moved by one of the most exciting impulses of chivalry—the defence of a good cause, and the reputation arising from exercising such defence with success. The virtues, and even the errors, of the Grecian leaders,—their valour, their obedience, their love for, rather than devotion to, woman, their zeal for the gods, their defiance of temptation, their consequent vices, their repentance, and the idea that triumphant bravery was a compensation for all backslidings,—these were characteristics not merely of a heathen but also of a Christian chivalry. In Odin's *Walhalla* it was the brave alone who sat at the permanent board, and drank wine out of the skulls of their craven enemies. The spirit of no coward ever glided among the groves of Elysium. The Christian knight who quailed was deemed the rejected of heaven, unless reconciliation could be effected beneath the cowl. Undaunted courage was the first qualification of a knight; to have a heart touched by love divine, and affected not less readily by human love, was perhaps his second;—these, with truthfulness, charity, and a rigid sense and practice of justice, were expected of him. They were found in the few rather than in the many. Even in the Holy Land, when St Louis led the zealous host which left France and sailed across the deep to the harmony of religious chants, sung by the very sailors as they trimmed their sails,—even under the view of that sepulchre which they had come to rescue from the infidel, and around the royal tent itself, the camp of the Christian knights was too often a scene of wild debauchery. The priest was indeed there to reprove, and to urge to a better course of life; and the knights probably repented as frequently as they offended. The system to which they had bound themselves was good, but they were continually infringing the rules of the system. The exceptions were many, it may be hoped, but the knights cannot, as a body, be said to have been firmly

"mounted on their principles." So excellent, however, was the principle, that a perfect knight was a character of almost superhuman grandeur. It has been said, it is true, that only in the system of Christian chivalry were its followers taught to refine the rudenesses of society by a tender reverence for woman, and by assaulting to the death those who would offend her, or put her honour in peril. But, in justice to the old Germans, it must be confessed, that when the too gallant Romans attacked the tribes who rallied round the valiant Herman, the honour of the German women was the jewel most highly prized by the tribes. On the other hand, Walter Scott has illustrated the most romantically chivalrous period in England—that of king Arthur—by introducing three knights, of whom he significantly says—

"There were *two* who loved their neighbours' wives,
And *one* who loved his own."

It must be remembered, however, that it was not till long after the establishment of Christianity that a religious character was given to knighthood. It has been sagely suggested that, as a system, it owes its morality to feudalism, which demanded from its champions truth, obedience, and bravery. The author of the *Letters on Chivalry and Romance*, published anonymously nearly a century ago, but well known to be from the pen of Bishop Hurd, states that chivalry, as a military order, conferred by investiture, and with certain oaths and ceremonies, sprung immediately out of the feudal constitution. When the lords of land, already referred to, were not in a state of war, the martial ardour of themselves and followers was kept up by jousts and tournaments. Knights, otherwise unemployed, rode leisurely from court to court, challenging the most famous wielders of sword or battle-axe in each city through which they passed. When the feudal policy generally prevailed throughout a great part of Europe, first the military, and then the religious, system of chivalry grew up as its natural consequence. Its effects went, however, much farther than this, it inspired not only the men, but it induced even female warriors to be moved by a passion for arms, to wander in quest of stirring adventure, to strive for the honours of knighthood and the rewards of valour, and to win fame in any way that spotless knight could win it. The romances illustrative of chivalry, and which tell us of handsome pages following their master to the field, falling in his defence, and being discovered to be love-lorn damsels, at least have no doubt a wide foundation on fact. The wife of Robert the Norman fought at his side, not under cover of his shield, like the young chief of the clan Quhele under that of Torquil, but "shoulder to shoulder," leaving him, only to rally the fugitives and lead them once more to the field. The Crusades saw many a female knight incased in steel, and valiantly doing knightly duty; and the poet of the Crusades has made use of the fact in order to brighten some of the most lively incidents of his marvellous tale.

In the state of feudalism, when society seemed antagonistic, one portion against the other, and combatants often fought, not with respect to the justice of the quarrel, but with reference to the guerdon to be got by fighting, the horrors of war were many and terrible. It was the interest

Knights
Knight-
hood.

of all to temper them by generosity, justice, and acts of mercy. The example was good for the friend of to-day who might be a foe on the morrow; and thereby the present foe was the more readily converted into friend, comrade, or partizan. When the piping time of peace had arrived there was still occupation for the knight, in addition to joust or tournament. The captives of the last, or of any fray, who had not reappeared, were to be sought out and recovered; and the going in quest of adventures for the benefit of these or of any other distressed individuals, was of the very essence of chivalry, and the great glory of knighthood. Another end in view was the instruction and edification of the young knight by travelling. He sojourned on his way at many a court, from that of king to that of baron. Each of the latter held court, inferior, indeed, to that of the sovereign, but only in numbers, not in such refinement as was consistent with stately ceremony. Hence, he learnt courtesy, or practised what he had previously learned. The courteous knight derived that qualifying name from the practice of the manners which prevailed, or ought to have prevailed, in the courts of king or noble; for

"Of court, it seems, men courtesie doe call,
For that it there most useth to abound."

The authority of Spencer, however, has been met by that of Milton to show that such practice did not hold good in later times; for courtesy, as Milton understood it, was then

"——— sooner found in lonely sheds,
With smokey rafters than in tapestried halls
And courts of princes, where it first was named,
And yet is most pretended."

These last words, however, will serve to show that the practice had not died out in the great poet's time. He, however, saw in such practice only a pretence, and he preferred the honest rough manner of the rigid republicans to the most polished style of the most courtly of the cavaliers.

To be faithful to the courteous knight was the religion of his mistress. She was, or was taught to be, as true in devotion as he was strong and ready to protect. He being of the bravest, merited the distinction of being the favourite servant of her whom he hailed as the "most fair." But it must be confessed, that this reciprocity of tenderness and service must have existed, and did naturally exist, in all states of society where women looked to men for protection, and where they knew that, if they themselves lacked faith, they would not, in their great need, find a defender.

If chivalry itself enjoined "love for the ladies," the church added to the injunction the necessity, also, of love towards God. It was held that he who felt the one must be inspired by the other; and possessing both, his happiness was secured here and hereafter. He who despised the one would be deserted of the other. There were knights who fell into the power of the Saracens, and who changed their religion. These were branded as "recreant knights," who had abandoned their God and proved false to their ladies. The double faith was impressed upon the very pages; and when the young ladies of the family whipped the latter for some peccadillo, the fair scourger would taunt him with lacking a heart that would never know how to be true to a lady. After the whipping at such hands, the embryo knight would be laid hold of by the chaplain, and gravely informed that he who could not gain the respect of a lady was ill likely to deserve an affection more divine. When young Jacques de Lelaing entered the first list in the career of his thirty tournaments, he declared that no opponent could possibly unhorse him, unless God forgot to guard, and his lady to pray for him.

The Gothic system of chivalry has by some been looked upon as a reproduction of the heroic system. This fact has been already alluded to. In Greece, especially, has the similarity been detected by some writers. The nume-

rous petty and independent governments there bear a resemblance to those of feudal times. In each system, the sword was the instrument of honour. The readers of Thucydides will not fail to remember that, at the very commencement of his history, he tells us at what period the Athenians began to leave off wearing the sword as a common appendage to the dress. When this change of fashion was effected, he recognised the extinction of a primitive sort of feudality. Times of violence had gone by; and as the wearing of the sword commonly only led to bloody quarrels, and kept up a race of ruffians, it ceased to be fashionable, because it ceased to be the distinctive sign of a courteous gentleman. It is curious that Beau Nash ordered the disuse of the sword as an appendage to the dress in the Bath Rooms, over which he ruled supreme, for the very reason adduced so many years before, with respect to the Athenians, by Thucydides. Ceasing to be a mark of nobility, noble and gentle ungirded the weapon from their loins.

But there were many things similar, besides the extinction of the two sorts of chivalry, in the surrender of their common emblem—the sword. The Abbé Banier has shown us, in his great unveiling of the mysteries of classical stories, that the gods, monsters, and other heroes of legend and poetry, were but men, described after an exaggerated and distorted fashion, just as we know that the giants and savages of the romances of chivalry were only greater or less feudal lords of a more or less dread character. As for the hapless virgins delivered by cruel parents to old dragons, from whom they are rescued by enterprising knights,—they are but maidens compelled to wed against their will, and who are carried off from their ill-matching mates just as young Lochinvar carried off the lady—too happy to fly with him—from the Forsters, the Fenwicks, and the Musgroves of Netherby. In many of these cases the heroes work under the irresistible power of enchantment. The greatest charm that impelled either classic or Gothic knight was that which acted on him from his lady's eyes. Occasionally, these charms were of too great a potentiality; but if ill results ensued, there was a happy method of getting out of the difficulty. Semele ascribed the paternity of her joyous son to the much-calumniated Jupiter: in later times, when it was obvious that anxious ingenuity could not find profit by plagiarizing such an idea, many a foundling was brought into a baronial hall, and reared to knighthood under the designation of being "fairy-born."

The courtesies of knighthood are among the best parts of the institution which has descended to us. They have existed among brave men since the time that Tubal Cain welded the first blade. Stern, but courteous, are the heroes of the Iliad: as stern, though less courteous, was Bayard, who was not averse to dealing an unfair blow, if it secured to him an advantage; and more courteous, yet perhaps even more stern, were those great captains of modern times who met at Fontenoy, and who almost deferred the battle till the next day, each being anxiously polite in requesting his adversary to commence the exterminating fire. It was the courtesy of chivalry that inspired Crillon to send vegetables to the scurvy-infected Elliot, whom he was besieging in Gibraltar; and, to come down to the last example, it was perhaps an unnecessary courtesy which inspired Sir Edward Lyons, when our own men were lying half-famished in the trenches before Sebastopol, to send a fat buck to the hostile admiral within the city. Still, courtesy between knights engaged in hostilities has ever received an universal and approving acknowledgment. When George II. sent the Garter to Prince Ferdinand of Brunswick, the great victor at Minden, his investiture took place in front of the whole army. The French General, De Broglie, learning the nature of the ceremony, generously hastened to do honour to valour by the exercise of which the French had grievously

Knights
and

hood.

Knights
and
Knight-
hood.

suffered. He, too, drew up his men within sight of the spectacle, and then saluted the new knight, whose skill and courage had been rewarded by George II. De Broglie dined in the evening in Ferdinand's tent, the guest of his great adversary. On the following day they were as fierce enemies as ever.

The alleged fact, that the courtesy of Christian knights towards women was always of a more refined nature than that of the ancient heroes, has been accounted for on the ground of the difference of civil condition in the two. Under the feudal system, the ladies could hold fiefs, and hence, it has been suggested, the respect paid by chevaliers to dames so privileged. This is judging knightly gallantry by a very debased standard. It would simply prove that chivalry respected only a wealthy virtue, and that Christian knights, like common adventurers, had regard only for rich heiresses. The truth is, that the Christian system raised the condition of woman, and made of her a companion for man. The heroes of classical times did not sit at meat with the heroines. Under chivalry it was the greatest sign of friendship for a knight and fair companion to eat off the same plate. In such case it was understood that the two were unmarried. We have instances in romance of married ladies expostulating with their jealous lords, and giving warrant of their own reserved bearing by protesting that never, since their espousal, had they eaten off the same plate with any knight, save their respective husbands. No doubt the courtesy of which we were before speaking degenerated in many cases into mere formality; and often it was practised simply because it was the fashion. Louis XIV., for instance, was so scrupulously polite towards women, that he would not pass the lowest female servant in his palace without lifting his hand to his plumed hat. The multitude of courtiers followed the fashion thus royally set; and woman became an object of adoration. But this mere empty fashion lacked the Christian and chivalrous sentiment; and the very Knights of the Holy Ghost were ever ready to degrade the fair object which they professed to worship.

It must be confessed, however, that this was a period posterior to that of the so-called Gothic Knights, by which chivalry is usually judged. In the romantic descriptions of the feudal period something must be allowed for the imagination of the romancers. Still, checking them by history, and remembering the influences most powerful at the period in question, it cannot be denied that it abounds with proofs of ennobling love and triumphs of exalted friendship. These were the more renowned at the time, because of their rarity in the ages immediately preceding, and among the rude contemporaries from whom such instances of truthful affection and friendship exacted admiration. The pyramid of praise raised in honour of the virtue of Lucretia and the continence of Scipio is a satire upon the manners of the women and of the leaders of armies of the two periods. The eulogy awarded to faithful knights is an unsatisfactory proof of the general condition of the times and of the society in which they lived. It was a part of their mission to reform both; and hence the praise which has been showered on their vocation, and the respect paid to the virtues, in the practice of which they set so bright an example. That some knights failed either to fulfil the vocation to which they had bound themselves, and to practise the virtues which were held to be inseparable from the knightly character, is only a proof that chivalry was not above poor human nature and its many errors. In Germany, perhaps, the system was carried out more completely than in any other country, and it is precisely there that the phrase, "Er will Ritter an mir werden,"—*He wants to play the knight over me*,—implied an inclination to oppress and do wrong on the part of the Ritter or knight. Our own early poets were acute observers of the defects of chivalry; but because they

satirized these, they did not, therefore, believe that chivalry itself had been founded on a wrong principle. If Chaucer raises a laugh by Sir Topaz, he makes amends by exacting respect for Cambuscan.

Bacon, in speaking of knighthood as a military dignity, remarks, that "there be now, for martial encouragement, some degrees and orders of chivalry, which are nevertheless conferred promiscuously upon soldiers and no soldiers." The rules by which the conferring of chivalry was regulated were, from very early times, irregularly observed. Bacon's words, "martial encouragement," have, perhaps, especial reference to these innovations. In the early feudal period, men who had borne themselves nobly in battle received not "martial encouragement," so much as "martial reward;" and they were dubbed knights, that

"By their light
Might all the chivalry of England move,
To do brave acts,"

In process of time, however, martial encouragement often took place of martial reward; and we frequently hear of men being made knights previous to a battle, in order to inspire them with indomitable resolution in the coming fight. The spurs were thus significant of a stimulant; and he to whose heels they were affixed before the battle felt, that if he had not to win, he had at least to prove that he deserved those appendages to, as well as symbols of, chivalry.

In certain cases this rule was no doubt found effective. At all events, it rested on a better principle than that of later times, which affixes stars of knighthood on the breasts of men with nothing to recommend them save brute courage, but whose incompetency and indifference have been more fatal to their heroically patient followers than the arms or valour of their adversaries. Bacon states, that the honours of chivalry were conferred promiscuously upon soldiers and no soldiers. The first civilian in England, or, to describe him more correctly, the first tradesman in England, who was a recipient of these honours, was that Sir William Walworth, Lord Mayor of London, who won the distinction by slaying, in presence of the king, that unlucky Wat Tyler, whose insurrectionary spirit had not been excited without something like reasonable cause. Sir William was a tradesman; but he drew profit also from less honourable sources than those of trade; and the houses along the river side, of which he was the proprietor, brought him a revenue less cleanly earned than that which Vespasian derived from his celebrated tax. The popular error, which describes the sword in the shield of arms of the city of London as one placed there in memory of the knight's service rendered by Sir William in Smithfield, does rank injustice to St Paul. The sword in the shield is the sword of the great apostle; and had the first tradesman-knight in England been moved as readily by the apostolic principle, as he was to use the sword, he would perhaps have been a less wealthy man, but he would have been none the less worthy a knight. In Bacon's own time there was a "no soldier" who attained the dignity of knight for better service rendered to the community than that which Walworth had rendered to the king. The individual in question was Spielman. His great service was in erecting a paper-mill, the first ever seen in England. This general service received the great reward of knighthood at the hands of Elizabeth. The same guerdon was given by her father for service profitable only to his own royal person. As an instance may be cited the proctor Tregonnel. This astute lawyer had been employed in the affair of the divorce between Henry and Katherine of Aragon; and his ability had been exercised to such speedy and desired purpose, that the enfranchised monarch, free to marry again, made a knight and a pensioner of the proctor whose zeal had mainly helped, and certainly hastened, the completion of the

Knights
and
Knight-
hood.

Knights
and
Knight-
hood.

cherished object of the king. On the other hand, Charles I. conferred the honour of knighthood on a Scottish ecclesiastic; but the reason for such act has not been ascertained. The fact, however, remains undisputed, that, at his coronation, Charles raised to the dignity of a knight William Murray, the minister of Abdy, in Scotland. Local antiquarians may, perhaps, be able to discover for what service rendered the warlike dignity of chivalry was conferred upon this steward of the mysteries of the Prince of Peace.

Among our doughtiest old knights, not those of ballads, but of history, Sir Hugh Calvely is famous, in a double sense, for it was said of him, that he could feed like two, and fight like ten. He was as successful in love as in the lists; for he espoused the widowed Queen of Aragon, and the royal Aragonese arms were quartered on Sir Hugh's tomb towards the end of the fourteenth century. He was not the only knight or man-at-arms who wedded with a queen,—Sir William de Albini espoused the widow of Henry I.; the relict of King John was successfully wooed by the chivalrous Count de Marche; after the death of Henry V., his fair Katherine joined hands with gallant Owen Tudor; and Katherine Parr forgot Henry VIII. after she became the bride of the faithless Seymour.

Let us now consider some of the forms of knighthood, and their origin:—"And he (Pharaoh) took his ring from his own hand, and gave it into his (Joseph's) hand; and he put upon him a robe of silk, and put a chain of gold about his neck." In these words, they who think a remote origin adds respectability to a system affect to discern that Pharaoh conferred the dignity of knighthood on the son of Jacob. This was, however, but an ordinary act of royal favour, and it made Joseph no member of any companionship. Among the ancient Germans, a spear and a shield were placed in the hands of each new young member of the republic; but they symbolized only a common citizenship, and were not marks of any distinction. The equestrian order in Rome was a privileged body, at first swift horsemen, and subsequently judges, but it was not a brotherhood of knights. We have long since given up the Order of Constantine, the alleged origin of which rested on the authority of a conveniently discovered statue, which as little proved that Constantine founded the "Golden Knights," as that statue which represented Augustus, with outstretched hands, imploring Nemesis, proved that the implorer was Belisarius begging by the wayside. There are some who traced the Order of Constantine to Isaac Comnenus; and if he really founded any order so named, it was probably at the suggestion of those monks whose influence was often potential from behind the throne. The German Catti were distinguished among the tribes generally, by certain manners, fashions, and vows, which bound them to one another, and laid them under obligation to achieve certain feats of arms. In this respect there is some similarity between the Catti and the chivalry of later times; and to this tribe, thus singular in its customs,—customs which are familiar to us by the descriptions of Tacitus,—may, perhaps, be ascribed the honour of having originated observances which were adopted by chivalry. But chivalry had organizations unknown to this remote and doubtful ancestry, and traces of this organization are not to be found earlier than the period of the Crusades. There were knights, rather than orders of knighthood, indeed, previous to this period; but the machinery of a great company, if we may be allowed such a phrase, was not known till warriors were possessed with a desire to rescue the sepulchre of our Lord from the keeping of the infidel. Nearly a thousand years have elapsed since this desire first agitated society; and the infidel still keeps watch over the Holy Tomb. As far as this object was concerned, therefore, chivalry was only temporarily successful; but, as we have elsewhere hinted, knighthood had other ends in view, besides that which regarded the

Knights
and
Knight-
hood.

enfranchising of Jerusalem from the slavery in which it was held by the sons of Sarah. The first company was both spiritually and temporally minded. Its object was the extension of Christianity, the destruction of unbelievers, and the protection of those who made pilgrimages to the Holy Land. With the zeal sprang up imposition. A man who had vowed to repair to the East, either as a protector or a pilgrim, received substantial help, if he needed it, from all the religiously-minded who chose, however, to remain at home. One consequence was, that the castle-gate and humble homesteads were infested by idle mendicants, who begged for alms to help them on their pretended way. So general was this imposition, that the name of *saunterer* was given to the greatest idlers of the day—those who lived on the charity which they claimed as pilgrims on their road to the *Sainte Terre*, or Holy Land. The Knights of St John, and also the Templars, originated in a religious feeling of the most praiseworthy kind. Prosperity and superstition ruined both orders, and the sepulchre was once more surrendered to the keeping of the Saracen.

It is after this first "break up" that we find scattered companies of knights in various parts of Europe, who, sword in hand, converted such communities as had not yet merged from heathenism, and who, by right of that sword, took possession of the lands of the people whom they thus converted.

The exclusively temporal orders did not confine themselves, like the exclusively religious knights of St John and of the Temple, to the extension of the Christian faith, and the protection of those who professed it. Their object was to foster valour and all moral virtues, to increase the glory of particular nations, and to maintain unity among certain princely houses. The Knights of the Round Table,—an order which poets have founded for King Arthur in the year 51, are the types of such brotherhoods. Of all such orders known to have existed the statutes are true manuals of morality and *vade mecum*s of those desiring to be virtuous. The object of each founder, whether ghostly or military, seems to have been to have made true Christians, as far as his knowledge lay, of the brethren. If these failed, the fault lay in their not acting up to the instructions of the founder. In no two orders are the statutes precisely the same; they differ respecting elective qualification, condition, and object. Some have been but of small account; companionship in others has been eagerly sought by sovereigns themselves; and mighty rulers of great nations have found pride and satisfaction in suspending the collar of a knight round the neck of their newly-born heir. In most of them, nobility of blood was an essential qualification. This was especially so in the Order of the Holy Ghost. When Catinat became Marshal of France, Louis XIV. announced to him the royal intention of admitting him into the exclusive brotherhood. Catinat was an honest man, but he said he was not half gentleman enough. He was well content to remain disqualified by his birth, for an honour which he had won, if desert only were in question. The makers of pedigrees offered to furnish the modest warrior with hosts of noble ancestors, but Catinat declared that he would not be pressed into greatness by a visionary crowd of noble nonentities. "I would not purchase this very great honour," said Catinat, "at the cost of the smallest lie."

The Order of St Louis was expressly founded, in 1693, for the admission of well-deserving men, who had served the king faithfully for ten years. The order was, however, flung to any who would stoop for it; and so many were willing to do this, that Knights of St Louis were created by hundreds. People remarked of this order, as had been done in reference to that of St Michael, founded and abased by Henry III., that the star of the saint was to be seen upon every ass in the streets. The feeling of contempt for the Order of St Michael is exemplified in the case of the man who purchased the mantle and collar of a deceased knight,

Knights
and
Knight-
hood.

and therewith decorated his mule. Our own James I. made knighthood almost as common, particularly in the early portion of his reign in England. Indeed, he never then drew his sword unless to dub a knight; and he was for ever laying the weapon, in the way of honour, on individuals more or less willing to endure the infliction.

While some orders have fallen to decay, or altogether disappeared, new companionships have been created, or old ones revived. On some occasions the sovereign of the order has set but an indifferent example of gallantry to his knights. Louis XV., for instance, marred the effect of a grand installation of the Knights of the Holy Ghost, by previously informing the foreign ambassadors that it was not his intention, if they attended the ceremony, to salute them. The ambassadors accordingly absented themselves, and the show lost thereby half its brilliancy.

Roman Catholic sovereigns can found orders without papal sanction, as the German princes could without the imperial consent; but the approval of pope or emperor was considered as giving an additional lustre to the order. Perhaps the most unusual, if not the most irregular circumstance connected with the dignity of knighthood, is the fact of three ladies having, at different times, been created Knights of Malta. The first was the Neapolitan Princess von Rosella, in 1723; the second was a princess of Wurtemberg, twelve years later; and the third was Nelson's Lady Hamilton, knighted by the Czar. In all these cases the honour was conferred with the sanction of the grand master; and gallant deputies, clad in full costume, first dubbed the ladies knights, and then invested them with the insignia of their newly-acquired rank. But many of the ceremonies of this order were inconsistent. After election, a knight was bound to eat his penitence feast, and accordingly he sat down to bread and salt, these being the only things which the order bound itself to provide for him. But this feast concluded, one more substantial and magnificent followed; and at every health the brazen mouths of the artillery boomed forth their loud *hurrah*!

To receive the insignia of knighthood from the hand of a sovereign has been usually deemed the highest honour; but there is one instance at least of an individual preferring to take the dignity from the hand and sword of a less noble person. Frederick, landgrave of Thuringen, in 1338, was at the court of our King Edward, who offered to create him knight. "I will only accept such honour," said Frederick, "at the hands of a man who has never turned away from an enemy." The king promised to sanction the performance of the office by such a deputy, if he could be found; and this was done in the person of one of Frederick's own officers. This rude story, however, seems to us to be rather apocryphal.

We have spoken of the knights being enrolled in various orders; we may add, that there was a class division also. Knights were of two classes, the *Equites Aurati*, who received the honour at the hands of emperors or kings, and whose Latin title was derived from the golden spurs fastened to their heels; and the *Milites*, who were dubbed by other knights of renown, or by ecclesiastics of great dignity. Many a civilian was decorated with the golden spurs, but the *Miles*, who was stricken knight by a knight of great reputation, was more highly honoured. Even kings were proud of such distinction at the hands of their subjects. Francis I. of France was made chevalier by the hand and sword of Bayard; and in England, among other instances, may be mentioned Edward IV., knighted by the Earl of Devonshire; Henry VII. by the Earl of Arundel; and Edward VI. by the Duke of Somerset. The *Miles* made oath that he despised death, and would be the protector of widows and orphans whenever appealed to. It was the *Miles* who figured in the lists in which he sometimes fought without revealing his name, whereby his honour was safe

in case of a defeat. Such a knight was ordinarily of noble blood, or had shown by his deeds that a noble spirit inspired him. He was usually followed by *armiger* and *scutifer*, who looked to his spear, shield, arms, and armour generally, and who stood by him in the fight, to help him in or out of the *mêlée*.

For valuable services rendered, these knights frequently received land from their lord, and this land was held on condition of further service being rendered whenever the holder of it was called upon by the lord. In process of time this method of recompensing past, and purchasing future services, was accounted as being of too costly a nature; and the different orders of knighthood are said by some writers to have arisen partly out of the difficulty of otherwise fitly rewarding military service.

From the earliest times the sovereign, especially, looked for support from such service. Such an one, it is believed, was that incredulous nobleman who disbelieved the prophecy of Elisha, and who was trodden to death at the city-gate, because of his want of faith. He is described as "one of the lords on whose hand the king leaned" (2d Kings, chap. 7). The Hebrew word for this honoured personage is derived from one which signifies "three;" but interpretations vary as to whether the word signified one of those knights, if we may here use the name, who fought in a chariot where there was room for three to fight; or who went into battle with three war horses; or, finally, that he was third in order after the king. However this may be, it was on such a champion that the king is said to have leaned; and, in more recent times, the sword was girt to the side, and the spurs put to the heels of him on whom the king knew he could lean with security of unfailing support. In more recent times, the spurs have been the emblem and stimulus of chivalry. It is therefore singular, that although a knight's spurs were almost invariably first attached to his heels in chapel, church, or cathedral, he could not afterwards wear them within the sacred precincts, except he paid a fine to the choristers. One result of this custom was, that the choristers became less careful of their duty than of looking out for, and demanding money from, all persons who entered the holy edifice wearing spurs. This evil was sought to be remedied by an enactment, or rather a rule, that if the chorister applying for the fine were challenged to say his *gamut*, and failed, the wearer of the spurs should be exempt from all impost. The late Duke of Cumberland once entered the metropolitan cathedral with rowels in his boots. He was immediately beset by the choristers for the usual fine, but he, rather ungenerously and irregularly, evaded the impost by pleading that he certainly had a right to wear spurs in a cathedral, inasmuch as that it was under the roof of such an edifice that they had been first put on. The late Duke of Wellington, on a similar occasion, conducted himself in a way highly characteristic. He entered the chapel-royal booted and spurred. A young chorister approached him, and boldly demanded *spur-money*. The duke immediately challenged the boy to repeat his *gamut*, the boy failed in the attempt, and his grace passed laughingly on, impost-free. A warrior of far less note, the Earl of Cardigan, being similarly accoutred, on entering the chapel-royal, was similarly appealed to by the choristers, but the applicants were unceremoniously thrust aside by the accomplished leader of the lost brigade.

In the old days, the sword played an important part in the creation of a knight. After the candidate for chivalry had confessed, and spent a night in church in prayer and fasting, he appeared before the priest for consecration. During the "office" he placed his sword upon the altar. When the priest had finished reading the gospel, he took the weapon, blessed it, and then, with benison on the warrior, laid the blade on the neck of the knight, who was not, however, accounted a knight complete until he had re-

Knights
and
Knight-
hood.

Knights
and
Knight-
hood.

ceived the sacrament, and vowed obedience to the faith. In later times, the church ceremony was not a necessary, though still an approved form for the knight to go through. He was a true chevalier if he received the accolade, the sword on the neck, the box on the ear, and the spurs to his heels, from the hand of his prince, or prince's deputy.

If there were knights who kept up the reputation of their country, and their own renown abroad, by the sword, there were some who, in time of peace, employed themselves usefully at home with the pen. The *Livre du Chevalier de la Tour Landry* exhibits to us not a mere literary knight, but one who did for the young ladies of his time what Mrs Chapone did for her young contemporaries at a later period. The book was originally written for the benefit of the good knight's two daughters, and it abounds in maxims, counsels, and illustrative lessons,—the object of all which is the better training of “damosels,” both physically and morally, than had hitherto been their lot. It is singular to find a man from the camp lecturing his fair readers on deportment, seriousness of mind, daily behaviour, and religious feelings. The lecturer is by no means nice of phrase, nor delicate of allusion, in pursuing his theme; and he occasionally puts his conclusions in such antagonism with his premises as may have produced hilarity in many a hall, even in his own days.

The married knights had often good reason for anxiety touching their daughters, and also their wives, during their absence on distant expeditions. They had some resource, however, in the benevolence and gallantry of richer men of their own class. Sir Thomas Berkeley, in the reign of Richard II., left L.100 for the use of poorer knights desirous of proceeding to the Holy Land. Those married knights who repaired thither, or to foreign wars, and who had not castles of their own wherein to leave, or which were not strong enough to protect, their wives, entered into singular agreements with respect to the ladies in question. Thus, in Surtees's *Durham*, mention is made of an indenture in the Treasury there, to the effect that “Sir William Cluxton is minded to go to the wars in France, Sir Thomas Surteys has agreed to receive the Dame Elizabeth, wife of Sir William, into his house of Dinsdale, for the space of one year, to be well and honourably entertained, with her waiting-maid and page (being of decent and sober behaviour), and for this Sir William covenants to pay ten marks.” This indenture is dated “At Sudberge, April 1416;” and there are others of a similar nature extant.

Fulke of Anjou, however indifferently he may have treated his wife while at home, was a rigid disciplinarian of his son, the celebrated Geoffrey. He so subdued this boy's proud spirit, that Geoffrey, after being compelled to carry a heavy saddle many miles, laid it reverently at his father's feet when bidden to do so. Fulke foretold that such un murmuring obedience would make a good knight of him. Nor did Fulke spare himself. When in the Holy Land, he bound two of his servants by oath to do whatever he commanded. In accordance with the oath, they dragged him naked, in sight of the infidels, into the holy sepulchre. There, while one held his neck in a withe, the other scourged him with a rod on his bare back; and the knight cried the while upon God to have mercy upon him, “perfidious and runnigate” as he was.

The law had great regard that a knight should never suffer “let or hindrance.” We find an instance of this in the case of Sir Franco Tyas. Sir Franco had a squire, named William Lepton, and “Will” owed a small sum for mercery, to one German, who being unable to get his money, levied a distress, and seized the squire's horse. The knight immediately brought an action against German, whose seizure of the horse was described as being “ad dedecus et damnum prædicti Franco,” as his squire was thereby prevented from attending on him. Sir Franco recovered

from the unlucky mercer 100s.; and as money was worth twenty times more in the days of the Edwards than it is now, that sum represented L.100 of the coin of current value. Something, too, may have depended on the exact rank of Lepton. The armiger, or spear-bearer always ranked before the scutifer, or shield-bearer.

Some knights, took to horse for other purposes than tilting or crusading. Taylor, the water-poet, has celebrated one of this sort, of the times of Edward II., and also the fate which righteously befell him and his companions.

“Sir Gosselin Denville, with two hundred more,
In friar's weeds, robbed, and were hanged.”

Sir Gosselin and his followers therefore formed a less joyous, but perhaps a not much less respectable company than the troop headed by Sir Roger de Mortimer (cirr. 1280). Sir Roger left London for the grand jousting and tourney at Kenilworth, attended by 100 knights, and as many ladies, who preceded them all along the road, carolling gay ballads as they went.

Despite the courage with which these chivalrous soldiers fronted death, they incurred no reproach by doing their very utmost to avoid it. This was especially the case with the German knights, who thought it not unseemly to wear the *Noth Hemd*, or “shirt of need,” which was supposed to render the wearer proof from all wounds. There was much ceremony used in the making of this garment, on which were embroidered figures of very frightful aspect, worked in by fair hands, with the intention of terrifying any antagonist bold enough to encounter the knight who wore this shirt, or tunic rather, over his armour.

In the encounters which took place between respective knights, the laws of chivalry were not always respected. We read frequently of adversaries assailing each other with “foul” strokes; and the most renowned of these warriors is not free from this charge. Where death ensued, it was sometimes customary to slaughter the dead knight's horse at his master's grave, and fling the carcase in, upon the cavalier's corpse. This ceremony was observed as recently as the last century in Germany; and we have a trace of it in our own country in the steed which is led to the grave's side at the funerals of cavalry soldiers. Among English knights who have sprung from low estate to be at once the flower and mirror of chivalry, Sir Robert Knowles bears a brilliant reputation. In the wars of France, under Edward III., he was so renowned as a destroyer of cities, that the standing fragments of ruined houses were called Knowles's Mitres. Sir John Hawkwood was of as low birth as Knowles; and at first of even lower vocation, for Hawkwood was originally a tailor. He turned soldier, was knighted for his valour by Edward III., became a celebrated “soldier of fortune” in Italy, and is not yet forgotten in the city of Florence. Hawkwood was noted for the readiness with which he extricated himself from apparently insuperable difficulties. This was one of the happiest qualities of a knight, and it distinguished Sir Richard Edgecumbe, who escaped from the pursuers, despatched after him by Richard III., in a manner very closely resembling that by which Rob Roy Macgregor got clear off, after being unbuckled by Ewan of Brigglands.

The ransom of knights was always a criterion of their value. In some cases this seems to have been significantly small. Thus, Queen Elizabeth gave two mastiffs for a noble knight's ransom. The history of Birmingham, too, presents us with a curious incident connected with the subject of ransom-money. When Prince Rupert took vengeance on the republican town which refused to wield a blade for the royalists, he captured many hard-fighting denizens of the place; and these ransomed themselves at a shilling, eightpence, and even twopence a piece. In the great fight at Evesham the Birmingham smiths followed the

Knights
and

hood.

Knights
and
Knight-
hood.

banner of their lord of the manor, and showed by their valour how worthy they were of chivalric honours.

Perhaps knighthood was never more fairly won than when John Copeland captured the gallant King David Bruce at the battle of Neville's Cross. The value of the service was proved by Edward's estimation of it; for he not only knighted the captor of a king, but granted him an annuity of £500 per annum. Commercial men, however, have gained the highly-prized honour for services of a different sort, indeed, but of higher social value. We may cite as an instance, Stephen Brown, the Newcastle grocer, who became Lord Mayor of London in 1438. It was a year in which the horrors of famine were aggravated by the cruel covetousness of the forestallers. The mayor privately despatched ships to Dantzic, which returned so heavily laden with rye, that the price of grain fell immediately, and the famishing people were fed at a reasonable rate. Fuller says of this knight that "he was one of the first merchants who, in want of corn, showed the Londoners the way to the Barn-door, I mean into Spruce-land." The very name of Brown, however, would have been considered a disgrace to chivalry by Spanish knights, who had a decent horror of monosyllables. Thus, when the plague prevailed in London, in the reign of Elizabeth, the Queen placed the Spanish ambassador under the hospitable guardianship of Sir John Cutts. The ambassador was rejoiced to profit by the refuge afforded him in the mansion of a bountiful housekeeper, but he expressed his disgust at being lodged with a knight with a monosyllabic surname! The custom of conferring the honours of chivalry on men of low degree was not confined to England. Pittscottie informs us that the Earl of Mar, who owed his title and spurs to James III. of Scotland, was originally a mason; but Cochrane, the name of the individual thus ennobled, seems to have been, at least, an architect. If James III. gave signal honour to the arts in the person of Cochrane, Henry VIII. as much distinguished science, in its legal view, by raising a sergeant-at-law to the dignity of chivalry. A curious result followed. All the sergeants took a corporate view of the matter, and declared that the entire learned brotherhood had been elevated by the honour conferred upon one member of it. Accordingly, since the period in question, the learned sergeants have claimed equality of rank with knights-bachelors, and they decline to "go below" them.

Although the monarchs of Great Britain and Ireland have frequently rewarded great desert, so far as it can be poorly rewarded by the now barren, yet not unenviable, distinction of chivalry, the rule by which such recompense is regulated is incredibly absurd. We do not speak now of that more simple "knighting" which tacks "Sir" to a sheriff's name for carrying to court a congratulatory address. We allude to the coveted distinction of the civil K.C.B. A man may be an unparalleled benefactor to his country, but unless he be in the government service, in some way bearing the Queen's commission, he cannot possibly be a Knight Companion of the Bath. It is an error to suppose that the "civil" dignity is open to the meritorious generally. If the aspirant, however deserving, be not in the actual service of the government, he may be "knighted," but he cannot be a K.C.B. The injustice of this rule is equalled only by its absurdity. Almost as absurd is the latest incident that has been put on record with respect to chivalric decorations. The Emperor of the French conferred on several British subjects, who had distinguished themselves in the great competition at the Paris Universal Exhibition, the Order of the Legion of Honour. No foreign order can be worn by an English subject, but with the sanction of the sovereign, and in this case the sanction has been withheld. Thus, we neither distinguish our really great men at home, nor allow them to be distinguished abroad. Queen Anne once thought of an order of Minerva

for the reward of great literary merit. The symbol was to be a silver owl, and therewith the matter was laughed at and forgotten. Let us hope that under Queen Victoria we may have an order of merit for knights of a more useful character than those of old, whose merits, however, were properly recognised in rewarding service most useful in its day.

At a not very remote period it was customary to address the clergy by the knightly title of "Sir." This title was, however, originally employed to distinguish the Bachelor of Arts, who was called "Dominus," from the Master of Arts, whose proper appellation was "Magister." For a long time, however, the chivalrous prefix was conferred on all the clergy indifferently; and "Sir" equally distinguished knight and cleric. It was used, however, not as in chivalry, with the Christian name of the dignified person, but with his surname.

This custom existed throughout England, and it was observed also in the Isle of Man, but with some exceptional clauses. Thus, in the ancient island, the prefix of the knightly title of "Sir" was only allowed to native ministers, "unless," says an old history of the island, "they be parsons of the parishes, which are but few (most of the parsonages being impropriated to the Lord of the Isle or the Bishop), as thus, Sir Thomas Parr, minister of Kirk Malow. But if they have the title of parson, then they are only called Mr, as Mr Robert Parr, parson of St Mary of Bellaugh."

The word "Sir," as we have previously observed, stood for Dominus, Sieur, Sire, or Seigneur. Richard II., in his Act of Abdication, is styled "Mon Sire Richard." The monosyllable which adorns knighthood is said to have a very remote origin, and a very extensive circulation in all countries and languages. It is found in the Hebrew, "Sar," lord or prince, and "Sarah," a noble lady. In the Egyptian "Serapis," we have the Lord Apis; and it has been even suggested that the Saracens are not so called because of any connection with "Sarah," but as "Ser-agarenorum," lords of flocks; and, finally, as the Muscovites refuse to trace the word Czar to Cæsar, some etymologists are inclined to believe that the former word is only a form of the knightly "Sir," or lord. But we leave the consideration of this matter to the etymologists. Whatever may be the origin of the word, few who bore the title conducted themselves ill in the field or at the tournament. On occasions of very serious encounters, either in the battle or the lists, great attention was paid to the condition of the armour. This was considered of such great importance that, as painters of old used to mix their own colours, so knights of old were wont to forge their own armour. When the Duke of Burgundy was about to meet in mortal combat the great Duke Humphrey, the former lit his armourer's furnaces within his Castle of Hesdin, and forged with his own ducal hands every plate of the defences behind which he hoped to get through the encounter, if not unstained, at least as nearly unscathed as might be.

We will now proceed to briefly notice the history of the principal orders of knighthood, whose names are familiar to us, and the deeds of many of whose members have been subjects for the historian, the poet, and, when he would question the uses of chivalry, the philosopher, and statesman also.

Charity may be said to have been the foundress of the Knights of St John of Jerusalem, A.D. 1043. The sufferings of poor and wounded crusaders touched some kind hearts; a hospital was raised, and the male nurses of the patients became the Knights of St John. They were at first mere "Hospitallers Brothers of St John the Baptist of Jerusalem," were incorporated by the Pope, wore the habit of St Augustine, and were bound accordingly to poverty, chastity, and obedience. They had to make fre-

Knights
and

hood.

Knights
and
Knight-
hood.

quent journeys, and they had need of arms for self-defence. They were permitted to carry weapons, and gradually they grew into a great military order, bound to smite the infidel wherever encountered, and to defend the Holy Sepulchre and its cause. Candidates for admission presented themselves from all countries; and rich donations reached them from all Christian kingdoms. Ultimately, they were classed into seven languages or divisions. Three belonged to France, under the titles of France, Provence, and Auvergne. The other languages were Italy, Germany, Arragon, and England. The last was abolished at the Reformation, and replaced by what was called the Anglo-Bavarian.

The seven classes were subdivided into three divisions,—1st, The knights of justice, the governing body, of which every man was noble, from which the grand-master was elected, and whose members shared the lion's portion among them. 2d, The priests of the order, with the Bishop of Malta and the prior of the conventual church of St John at their head. There were true samples of a "working clergy" in this class, particularly in the chaplains on board the knights' galleys. 3d, The *servans d'armes*, the fighting squires who followed the knights in all expeditions, and did the work of active troopers. They were required to be "respectable," and none were admitted who had ever demeaned himself by engaging in trade, or even exercising any art. A worthless fellow of legitimate [respectable] birth might put on armour and serve in this class, but Pythagoras himself would have been black-balled had he been a candidate for admission. All classes voted at the election of grand-master.

Originally, the knights of the first class were not exclusively noble, but when the plebeians threatened, by continual increase, to outnumber the aristocrats, the latter looked to their interests in time, and so arranged, that not only was the admission of a candidate of low degree impossible, but none could enter who failed to prove a nobility of many centuries' standing.

When the order, after passing from the Holy Land to Rhodes, ultimately settled in Malta, many alterations took place. A knight was not required to ride before he was of age; but during his novitiate it was necessary that he should serve in three or four *caravans*, or naval expeditions, against the infidels. Among the celebrated men who so served, were the two Counts Königsmark. The younger of whom will ever be remembered in connection with the story of Sophia Dorothea, the consort of George I. The knights of whom we have briefly treated held their own in Malta till 1798, when Bonaparte extinguished them; but they still shiver on in a refuge said to have been granted them in Russia, where they are neither ornamental to the Muscovite system nor useful to mankind.

The Templars, or Knights-Templars, were distinguished for being at once a military and a spiritual body, which took its rise at Jerusalem about the year 1118. Nine Christian knights there resident devoted themselves to the service of God, as *Cononici Regulares*; and to the three ordinary vows of chivalry they added a fourth—namely, that they would protect all pilgrims on their way to the Holy City. King Baldwin assigned them a house near the "Temple of Solomon," from which they took the name of Templars; and the poverty of an order which existed on the alms of the compassionate was illustrated in the device which showed two knights riding on one horse. They soon became renowned for their intrepidity, an excellence which was sharpened all the more by the fact, that if a Templar allowed himself to be taken, his order would offer no ransom-money to the avaricious infidel, nor would purchase his freedom by anything more costly than the gift of a sword or dagger. The great St Bernard is said to have been the author of the statutes framed at Troyes, in Champagne, in 1128, for the regulation of the order. Ten years later, Pope Eu-

genius III. gave the knights permission to wear the red cross on their white cloaks.

From this period they began to increase in wealth and numbers. Even kings enrolled themselves in their company; and in every powerful nation in Europe, there were numerous "commanderies," enjoying more ample revenues than the crown itself. The increase in their wealth is proved by their purchase of the island of Cyprus from Richard I. for the sum of 35,000 silver marks. But with wealth they acquired a taste for luxury; thence came many vices, and one of them, which is generally the source of several that are worse, was alluded to in the popular proverb, "he tipples like a Templar." They became oppressors rather than protectors, especially in the Holy Land, renounced obedience to the Patriarch of Jerusalem, and waged war even against Christian sovereigns. They were the opponents rather than the allies of Frederick II., in the celebrated crusade of which that German monarch was the head, and the partial failure of which was among the least of the treacheries of the Templars. At length, for the greater crimes of a few, the whole order in France fell a sacrifice to the vengeance, hatred, and, it may safely be added, the cupidity of Philip the Fair. It was to France that the majority of the knights repaired after the loss of the Holy Land; and Philip had little difficulty in capturing the whole on one and the same day. His hatred against them was of long standing. When King Louis besieged Damascus, the Templars were under his banner, but just as the assault was about to be made, they placed themselves between the Christian army and the besieged infidels. With the latter they negotiated, offering to secure good terms for them on condition that they should deliver to the knights three basketsful of money. The Templars compelled Louis to agree to the conditions which the order proposed, and when they were signed, the cunning Damascenes sent to the knights the number of baskets agreed upon, full to the brim of copper money.

On whatever amount of truth this tradition may rest, it is certain that Philip strove energetically to obtain the approval of Rome and the French University respecting the step he had taken in seizing upon the persons and property of the Templars. But the church and the schools desired the jurisdiction of a temporal governor over a spiritual body; and Pope Clement V. sent ecclesiastical commissioners into France to watch over the possessions and bodies of the religious cavaliers. In the hands of these commissioners Philip placed several of the knights, and these, on being taken into the presence of the Pope, at Poitiers, accused themselves and the order of crimes at which the most hardened nature shudders, and of absurdities at which the dullest nature must laugh. Moved by this confession, or pretended confession, Clement surrendered the order to the mercy or vengeance of Philip, providing, however, that the wealth of the knights should be devoted to the furtherance of the Christian cause in the Holy Land. The Templars, despite some traitors among them, made a noble stand against their enemies, but they were fore-doomed as well as pre-judged, and ultimately the order was annihilated, by the delivery of the members to continual captivity or to a cruel death, and the king and the Pope divided the wealth of the order between them.

The military knights of Prussia, those against whom the Teutonic Polish astronomer Copernicus so successfully contended, not by force of arms, indeed, but of argument and truth, were probably a far less innocent society than the Templars. The Teutonic Knights not only knew how to acquire wealth, but also how to retain it.

Among the religious orders, that of the Teutonic Knights is assuredly not the least famous, nor was it the least influential. The order arose out of the misery which reigned

Knights

hood.

The Tem-
plars.

Knights
and
Knight-
hood.

among the besiegers at the celebrated siege of Acre, at the close of the twelfth century. The sufferings of the Christian soldiers excited the compassion of certain German merchants. These erected tent-hospitals, and rendered other services to the unhappy warriors of such value that the German princes enrolled the princely merchants in an order of knighthood, named the Teutonic Knights of St Mary of Jerusalem. This order had the especial sanction and patronage of Pope Celestine III. None could be admitted into it but men of noble birth; and, probably, the merchants who were the original members of the order were ennobled before they were enrolled. Their equestrian garment was a white mantle with a black cross, and this, with bread and water, constituted all the reward sought for by men who vowed to remain pure in body and mind, poor in purse, and to carry succour to Christians wherever it was most needed. The vow, however, was strangely construed in succeeding years. At the opening of the thirteenth century the order was powerful and rich, and carried on a bloody war in defence of the infant church of Prussia, under the sanction of the Pope and crusade-preaching saints. The order, after withdrawing from Palestine, conquered Prussia, Livonia, Courland, and other territories, which they swept of their pagan proprietors by means of fire and sword. Innocent III. was especially fierce against the Livonian pagans; and the Teutonic Knights who carried out his terrible behests gained glory or martyrdom by slaying or being slain.

It must be acknowledged that the Lithuanian heathens were not excessively tender-hearted. When they caught a knight, they immolated him in a fashion of barbaric splendour and stupendous cruelty. Voight describes one of these executions, on the person of the knight Margerard Von Raschan. The latter had been captured when bleeding from a score of wounds. His captors bound him upright on his horse, and burnt both alive—knight and steed.

Pious princes, and gentlemen of the sword who desired to see service, flocked to the banner of the order from all European nations. Our Henry IV., when only Earl of Derby, went over to Dantzic in 1390, with three hundred followers, and fought in the ranks of these formidable chevaliers.

The knights and their paid men-at-arms became in time nearly as cruel as, and far more wealthy than, the pagans whom they had destroyed, plundered, or converted. Pope after pope exhorted them to remember their vows, but all in vain. They chose rather to increase their possessions than defend the faithful. In some respects they may be said to have done both. But they became absolute masters of Prussia especially, their administration of which was of mingled good and evil—mercilessness and humanity. Their great apologist, Voight, insists upon eulogizing their spirit of toleration, which appears to have consisted in only slaying those of the enemy who could not be convinced that the new religion was superior to the old.

The romances abound in illustrations of the view in which these chevaliers looked upon the principle of honour. But reality is not less prolific of instances than romance. We will name one.

Prussia was infested by a band of gentlemen bandits, under the command of a squire named Arnold. No less desirable a prisoner than the Duke of Gueldres fell into their hands. To rescue so noble a cavalier, the Grand Master of the Teutonic order, with an overwhelming force, set out to storm the stronghold of the adventurers. Arnold did not await his coming. He first, however, visited his prisoner, made him acquainted with the condition of things, informed him whither he was about to retreat, and, bidding him tarry in the castle if he preferred doing so, took from him his promise to surrender at a certain time or place,

or send his ransom. The duke was rescued, but no entreaties nor representations could induce him to remain at large, after he knew that Arnold had again a roof over his head. He then surrendered himself, and remained a prisoner until his friends ransomed him. This illustration, however, is somewhat unsatisfactory; for if a knight, by breaking a promise, was dishonoured, how was it that so chivalric a body as the Teutonic order repeatedly and earnestly urged the duke to break the faith which he had pledged to Arnold?

Of more recently created orders, those of the Golden Fleece and the Garter may be said to have been the most famous, as they have also been the most enduring. The French orders of St Louis and the Holy Ghost threatened to eclipse all other confraternities, but these orders, without having been suppressed, have ceased to exist. The insignia may occasionally be seen on the breast of some ancient "legitimist" of illustrious birth, but since the fall of the Bourbons no new members have been officially created. At Frohsdorf, perhaps,—where the so-called Henri V. "bides his time,"—a faithful servant may occasionally be authorized to wear the august symbols, as they are worn by their exiled master; but these are not knights acknowledged by France; and their creation is not counter to our assertion, that the orders may be said rather to have ceased to exist than to have been officially suppressed.

Of the other two confraternities named, we will give precedence to that of the Golden Fleece. This brotherhood was renowned for its courtesy, and it may be fittingly treated with as much of that commodity here as we can show it, by giving it precedence in our pages.

The Golden Fleece (*Aureum Vellus; Toison d'Or*) has a classical origin. When Athamas of Thebes, in obedience to the oracle, was about to sacrifice his son Phryxus and his daughter Helle, they were rescued by their defunct mother Nephele, who had been metamorphosed into a cloud, and who gave to her children a ram with a golden fleece, on which they were to cross the seas, and find safety in Asia. Helle fell off by the way, and gave her name to the sea in which she perished—the Hellespont. Phryxus, more fortunate, crossed the Black Sea in safety, and landed at Colchis, a part of what is now called Mingrelia. There he slew the ram, and hung up the fleece, a thank-offering, in the Temple of Mars. The golden wool became an object of universal cupidity; but it was watched by a fiery dragon, whose vigilance was not overcome till the Thessalian Jason came, armed with cunning, and carried off the prize to Greece. In such wise have the poets sung of what is supposed by more matter-of-fact persons to have been a matter of gold-yielding mines in Colchis, and of the sheepskin "cradles" in which the lucky finders washed the auriferous earth.

When Philip the Good, Duke of Burgundy, was about to marry Isabella of Portugal, in 1430, he resolved to celebrate the auspicious event by founding an order under the patronage of St Andrew. He had a pious desire to further the extension of the Church and the Christian religion in the East, and particularly in the Mingrelian region, where the Golden Fleece had once hung, and St Andrew, according to tradition, had preached. But the Duke's fleece was to carry the Northern Church and the Romish religion more safely than the ram had borne Phryxus and Helle. This is the most reasonable of the many origins given to the renowned order. We are bound, however, to add, that it has been the most laughed at. Old Favina ridiculed it; and laborious Zedler, while he ridicules ancient Favina, agrees with him in ridiculing the account of the origin of the name and object of the order. Favina thinks that the Fleece of the valiant Grecian was in the mind of the valiant Duke when he founded the grand order of chivalry. Other

and
Knight-
hood.

explanations are not lacking. Thus, Philip loved a damsel of low degree, who was so little addicted to luxuries that she covered her toilet-table with a fleece, and the sight set laughing a whole bevy of courtiers who once followed the Duke into her room. Philip swore an oath that he would make every noble in Christendom proud to wear this fleece, which he made the sign of an order founded in honour of this "light o' love" lady. Some old chroniclers denounce this as a disgraceful story, and tell a worse, touching a lady still less scrupulous than the last, and whom Philip celebrated because of her infidelity. Others, again, come back to the Colchian theory, by asserting that the Duke took the vow of knighthood on a pheasant, a bird which originally came from the banks of the River Phasis, in the vicinity of Colchis. After all, there is a forgotten, but a common-sense and an ingenious origin ascribed to this order, and which may serve also to show how it came to be mentioned in connection with Jason and the Golden Fleece. In July 1430, such a harvest was reaped throughout Flanders, and the prospects of the remainder of the year were rendered so secure thereby, that the Duke, out of pure gratitude, constituted the knightly brotherhood; and as he perceived that the word JASON contained the initials of the names of the five months to come, July, August, September, October, and November, he was reminded of the fleece, and took it for a symbol. This is too ingenious a story to be omitted in an account of the origin of the order.

The object of the founder was expressed in an inscription on his coffin:—

*"Pour maintenir l'église, qui est de Dieu Maison,
J'ay mis sus le noble ordre qu'on nomme la Toison."*

Philip fixed the number of knights at thirty—all noble, and without reproach. They were bound by statutes, laid down at considerable length, and ninety-four in number. The knights were required to be without blemish; but this did not apply physically, for among the thirty original knights we find Baldwin de Launoy, Lord of Molembair, surnamed "the Stammerer." On the occasion of the first chapter Philip created only two dozen knights; and we may notice among them John de Villiers, the ancestor of the English plenipotentiary (Lord Clarendon) at the late peace conferences of Paris. To this descendant of the old De Villiers the Emperor of the French offered the grand cross of a chevalier of the Legion of Honour, which was respectfully declined, on the ground of its being unusual—perhaps illegal—for English ministers to receive orders of knighthood from foreign sovereigns. It was not till the accession of Duke Charles that an English king was invested with the insignia of the order, in the person of Edward IV., who was created Knight of the Golden Fleece at the chapter held in Bruges in the year 1467. At the death of Charles, the Netherlands fell into the possession of Maximilian of Austria, the husband of Charles's only child. The order passed to the Spanish crown with that portion of the Flemish inheritance of Charles V., Emperor of Germany, which was made over to his second son Philip, King of Spain; and the Fleece of Jason and of Burgundy is now stabled in the Spanish capital.

Of English orders, the most highly prized, if not the most illustrious, is that of the Garter, which we now proceed to notice.

Order of
the Garter.

The Order of the Garter has a properly chivalrous foundation. It springs from a double gallantry—from arms as well as love. In the days of the Crusades, when Richard Cœur de Lion was our King, there was a body of noble fighting men in the Holy Land, who were distinguished by a blue leathern thong, worn round the left knee. The symbol was not that of a recognised order, but the wearers of it were doubtless "brothers in arms" after the strictest

manner, and were probably therewith the personal friends or companions of the king.

*"Round Ormond's knee thou ty'st the mystic String,
That makes the Knight Companion to the King."*

Knights
and
Knight-
hood.

In 1343 the symbol of the thong was converted into the garter by Edward III. That monarch, having heard of the surpassing beauty of the Countess of Salisbury, celebrated a tournament in her honour at Windsor. The lady accompanied her lord to this rough festival reluctantly, and in very simple attire. All around her was a blaze of gold, jewellery, and beauty: she alone shone with the last only, and therein excelled all other ladies present. The king was, to use an old phrase, "stricken" with her charms, and he seems to have paid her that audacious homage which princes then could pay with impunity. But the Countess of Salisbury was as honest as she was fair, and had no intention, as Froissart remarks, to obey the king "in anything evil that might tend to the dishonour of her dear lord." The king persecuted the noble countess with his suit, whereby he outraged some of the strictest rules of chivalry. Divested of its romantic features, the narrative of the foundation of the garter would seemingly resolve itself to this—that the feast given by the king, who had great curiosity to see this lady, was annually repeated in honour of her, or in memory of her womanly virtues. Froissart calls the feast to which Edward originally invited the countess a "convocation of the order." Some organization, therefore, existed previous to the appearance of the lady at Windsor. The first regular chapter, however, was not held till St George's day, in the year 1344. At this first chapter Queen Philippa was present, wearing the robes of the order. Some authors, however, describe the chapter of 1349 as the first regular chapter of the order.

The presence of the knights at the feasts held on the anniversary of the day of their patron, Saint George, was very strictly enforced. If a knight allowed two festivals to pass without being present he was fined in a jewel, which he deposited on the altar in the chapel. For every succeeding year's absence the knight who so offended paid the forfeiture of two jewels. It was imperative on every knight to wear the garter in public, and on all occasions. He was equally strictly bound to wear the "sanguine mantle" from the eve of, to the morrow after St George's day. Though a knight was mulcted in a jewel for being absent from the annual feast, he had only to pay a silver penny for not being present at prayers, in St George's Chapel, whenever he was in the vicinity of Windsor. His own soul was otherwise well cared for; and whenever a member of the order died, the surviving members subscribed their gold pieces for a certain number of masses for his rescue from purgatory. It was the privilege, too, of any knight who incurred the penalty of death, to die only by decapitation. The rules of the order also enjoined especial forms of degradation for any member who should be guilty of cowardice. Such a crime was held to be almost impossible; at least as long as the heart of St George stood in its golden shrine above the altar of the chapel. This relic was brought to England by the Emperor Sigismund. St Ambrose tells us that when St George was dying, he bequeathed his trunk to the infidel—counting upon their conversion, in consequence. His heart he left as a legacy to the Christians. He must have had a prophetic vision, indeed, if it be true, as Anstis tells us, that the saint bequeathed his heart, not to Christians generally, "but to Englishmen alone; and not to every part of England, but only to his own Windsor; which, on this account, must have been more pleasing to the sovereigns and all other the knights of this most illustrious order." The Emperor Sigismund brought to England, not only this treasure, ac-

Knights
and
Knight-
hood.

counted so precious, but a portion of the skull of the saint also. He presented the same to the invincible Henry V.; and, till the time of the Reformation, the relic was an object of great veneration on the part of the Knights of the Garter, who had a particular reverence for their great patron, St George.

The rules and constitution of the order form a document of very great length: but there is nothing new in them touching the qualifications for chivalry. Piety, charity, truth, fidelity to Heaven and the fair, is the sum of all. It was, moreover, distinctly laid down that no person could be elected unless he were without reproach; but this rigid rule has been more frequently infringed than any other. In the wars of the Roses, knights were made or unmade with very little ceremony. If the chapter was full, the triumphant faction beheaded a few of the antagonistic party, in order to create vacancies for the conquerors. Not that there was always great desire to reach the honours of companionship. There are frequent instances of foreign sovereigns declining to accept the honour offered to them. Some hesitated, fearing that the fees might be heavier than they cared to pay. Occasionally we meet with princes who have accepted the dignity, but who forfeit it, because they neglect to appear, within a prescribed time, to take possession of their stalls.

The installation almost invariably took place at Windsor, but it was not there that the chapters were always held. A century after the order was founded, we hear of a grave king, Henry VI., holding a chapter in a very gay locality, —the Lion Inn at Brentford. In this jovial resort were elected two knights, Sir Thomas Hastings and Sir Alonzo D'Almade, on whom the king conferred a handsome gold cup. This hostelry was not the last place of its sort in which companionship in a first order of knighthood has been conferred. When Louis XVIII. was in London, on his way to his recently recovered throne in France, he was visited at Grillon's Hotel, Albemarle Street, by the Prince Regent. The French monarch improvised on the instant a chapter of the Holy Ghost—and taking the insignia from his own neck, he placed them round that of the prince, with the remark—"Of all I once possessed this alone is left to me; and I give it willingly to the most generous of princes." The new chevalier of the Holy Ghost returned the compliment, the same evening, by buckling round the knee of Louis the jewelled garter. "I am the first King of France who has worn this decoration since the days of Henry IV." His Majesty, in thus speaking, was not strictly correct, for Louis XIV. had worn the order. But the Grand Monarque received it from the hands of the uncrowned James II., at St Germain's; and the "late King James," as the English journals used to call him from the time of his dethronement, was held as having no right to confer an honour which could spring only from the reigning sovereign of England.

With regard to insignia, it may be noticed here that the "George" and "collar" were added to the garter in the time of Henry VII. So particular was this king in observing the rules of the order, and so earnest in his veneration of the patron saint, that, to encourage the royal knight, the Cardinal of Rouen presented him with a portion of a leg bone of St George. The bone was solemnly exhibited at one of those gorgeous chapters which Henry loved to hold in cathedrals;—the chapter in question was held in the old metropolitan church of St Paul. The monarch was so gratified with the cardinal's gift that he erected, at his own expense, a solid silver image of St George on the altar of his chapel at Windsor, and ordered that it should remain and receive homage there, "at all solemn feasts,"—"while the world shall endure."

That general remodeller of many things, Henry VIII., entirely recast the statutes of the "noble order." It

was found that the rules which bound the men of one time could not be rendered obligatory on the men of a later period. One of the new rules may have been useful when made; at all events, it deserves to be recorded. Originally it was not necessary that an individual should be a peer in order to gain admission into the order. Merit of some sort, the more distinguished the better, was the first qualification. In Henry's time there were several members of the order who were below the rank of peers. To these, indiscriminately, he granted permission to wear dresses made of woollen cloth manufactured in foreign countries. This was a movement in the direction of free trade; but the benefit of it was confined solely to the knights and peers: the common people were compelled to deck themselves, as before, in home-made productions. It is from Henry's time that date the regulations whereby men of high merit, yet of inferior social degree, are debarred from companionship. The king, very characteristically, broke his own rule, by giving the garter to Thomas Cromwell. In the reign of Edward VI., under whom much of the religious ceremony at installations was abolished, Lord Paget was ejected from the order on the ground of original lack of noble blood; but he was reinstated by Mary. There was, certainly, no lack of noble spirit under this queen. In proof of this may be cited an incident which followed the reception of her husband Philip in the order. The obsequious heralds, in honour of the occasion, were proceeding to take down the arms of England, in the chapel, and to substitute the shield of Spain; but some stout old English lords opposed the attempt, and with such vigour, that it was not persevered in. It was a rule of the order, that if a member plotted or rebelled against the sovereign, he thereby incurred forfeiture of his knightly degree, as far as it was connected with the order of the garter. It is very remarkable, however, that even after Philip had despatched the Armada against this country, he was not deprived of the garter, nor was his banner taken down. The conduct of Elizabeth, with regard to the two great enemies of the Protestant faith was remarkable. She retained Philip on the roll of knights, and she sent the garter to Charles IX. It is strange, fond as this queen was of magnificent displays, that she was the first sovereign of the order who discouraged the anniversary banquets. Her treatment of the newly-elected knights was also characteristic of the woman. Their election was not reckoned valid till it had received her sanction; and this she frequently withheld to the latest moment, finding pleasure in keeping the candidate for a highly-coveted honour in painful suspense.

Down to the reign of James I., the "ride" of a knight to Windsor, to be installed, was among the most magnificent, as well as popular spectacles of the period. The outlay for "bravery," as the incidental finery was called, was often enormous. James forbade much of it, under peril of a pecuniary mulct. He prohibited the giving of "livery coats, for saving charge, and avoiding emulation." This prohibition, however, he turned in some degree to his own profit, for his Majesty ordained, as an improvement on the old custom, that all companions, at their installation, should present a piece of plate, of the value of £20 at least, "for the use of the altar in St George's Chapel," and, of course, for the adornment of the royal banqueting-room in the castle. The sumptuary law of James would seem to have been inoperative; for never were there more splendid cavalcades of knights from London to Windsor than in the early period of the reign of Charles; but, also, never were there more dismal chapters held (sometimes only three or four knights obeying a sovereign summons) than when the times became agitated through the obstinacy of the king and the resolution of the popular party and their leaders. The "George" of this sovereign displayed his gallantry; for it bore, on the under side, the portrait of his wife, Henrietta

Knights

Maria. This famous jewel, cut in an onyx, and surrounded by twenty-one table diamonds, in guise of a garter, was worn, subsequently, by the worthless Lauzun, and is now in the possession of the Duke of Wellington, who inherits it from the late duke. Cromwell did not touch the garter, but he dubbed half-a-score knights; and "Oliver's Knights" were unjustly made the buffoons of the stage, long after the Restoration. Charles II. did not wait for that Restoration before he created Knights of the Garter. He made several during his period of exile; and the first two on whom he conferred the dignity, on recovering "his own again," had well earned the distinction,—they were Monk and Montague; and they were among the last who received the garter before they had been raised to the dignity of the peerage. James II. would have restored the ancient religious ceremonial if he had had time. On the other hand, under the grave William, the custom by which a knight was expected to celebrate his newly-gained dignity by a splendid banquet was renewed. In the newspapers of this period frequent mention is made of these feasts. As a sample, may be noticed the installation-banquet of Lord Portland, in March 1697. It is described as being of extreme splendour, and the fare was, certainly, equally abundant. The friends of Bentinck sat down with him to "three oxen, eighteen calves, twenty-five sheep, and a vast quantity of fowl." The journalist, however, has forgotten to inform his readers of the number of the guests. While Anne and George I. were creating Knights of the Garter at home, the Stuart king did not fail to exercise the same right at St Germain's, or wherever the court happened to be, for the time. It is said that George II. changed the colour of the riband, from dark to light, or garter-blue, in order to distinguish the genuine Knights of the Garter from those created by the Pretender, who retained the original colour. Under this same king, not only were the splendid banquets revived, but the popular curiosity concerning them seems to have been of a very exciting character. Thus, in 1752, on the anniversary of the birthday of the young prince, who was afterwards George III., there was an installation of knights at Windsor, followed by a dinner and ball. In connection with the banquet, Sylvanus Urban tells us that "the populace attempted several times to force their way into the hall, where the knights were at dinner, against the guards; on which some were cut and wounded, and the guards fired several times on them, with powder, to deter them, but without effect, till they had orders to load with ball, which made them desist."

Under George III. there were more irregular elections in the order than under any other king. Junius detected and exposed the illegality of the election of Earl Gower; and George III. abolished the statute of Edward, confining the number of companions to twenty-five, in order that he might admit all his sons. This bad example authorized George IV. to infringe the statute still more, by admitting foreign sovereigns to companionship, without any regard to the regulation by statute. The royal founder would now hardly recognise his own order, so different are, in many respects, its rules from those by which it was governed in the early days of its grandeur. Changes of manners, mutability of human fashion, and necessary modifications of religious ceremonials, authorize, in a very great degree, the statutes which are now in force. Many of the old ones, indeed, could not in these days be acted upon. No knight would accept the honour, on condition of always wearing the habit; and it would hardly be edifying to observe the whole chapter on their knees, as in the days of Henry V., before the supposed heart, and fragments of the skull and leg bone, of St George of Cappadocia.

In connection with the sovereign of the Order of the Garter we may notice, that after George, Prince Regent, had bound the Garter round the knee of Louis XVIII., he

expressed his own sense of the absurdity of English kings retaining among their titles that of "King of France." From the accession, therefore, of George IV. this title was dropped, and there disappeared from the coronation ceremonial those two knights who were, for the nonce, converted into dukes of Aquitaine and Normandy, and who were supposed to have repaired to the foot of the throne of the new king, in order to do homage for those provinces. Churchill alludes to this folly in his "Ghost," when he speaks of peers

" 'Who walk,' nobility forgot,
With shoulders fitter for a knot
Than robes of honour. For whose sake
Heralds, in form were forc'd to make,—
To make, because they could not find,
Great predecessors to their mind.
Could she ('Satire') not (though 'tis doubtful since,
Whether he plumber is, or prince),
Tell of a simple knight's advance
To be a doughty peer of France?
Tell how he did a dukedom gain,
And Robinson was Aquitaine."

The Order of the Bath has its peculiarly legendary tradition, which must be noticed, although it need not, necessarily, be credited. Henry IV., it is said, was surprised in his bath by two widows who had a feud, and who requested him to pronounce judgment between them. From these litigants the modest monarch made his escape by springing from the bath, and he founded the order in memory of the circumstance. It was the rule of all knighthood that the candidate for chivalry should bathe the night previous to the celebration of the solemnity at which he was to be created a knight. The order, which took its name peculiarly from an observance which was common to all orders, was founded at the close of the fourteenth century. The shield of the order bore three golden crowns in a field azure, with the inscription, *Tria in unum*. One of the most brilliant assemblies of the order was at the coronation of Charles II.; and in former times a Knight of the Bath was seldom created save at extraordinary seasons, such as the birth of an heir apparent, a royal marriage, or a coronation. The Order of the Bath, which some writers describe as a simple order of Knights Bachelors, fell into disuse. It was revived, however, in 1725, in the reign of George I., when the Duke of Montague is spoken of under the title of "Grand Master." When Walpole re-established this companionship, for the sake partly of rewarding or of purchasing political service, a few persons affected to make light of the honour, but when the minister declared that the Bath was a necessary preliminary to the Garter, the former rose in estimation, and the insignia became objects of a laudable ambition.

The old constitution of the Order of the Bath remained in force until the period immediately following the battle of Waterloo, when the Bath was divided into three classes, for the purpose of rewarding the various claimants of distinction. These are the Grand Cross, Knights Commanders, and Knights Companions. The first two rank above ordinary Knights Bachelors.

Ireland had no order of knighthood till the year 1783, when that of St Patrick was instituted by George III. In 1815, George IV. established the Guelphic order of Hanover. The decoration was at first conferred almost exclusively on Englishmen, but the Guelphic order having gone with the kingdom of Hanover, apart from England, the star is now seldom seen but on continental members.

The ancient Order of the Thistle dates at least from the times of Robert II., whose coins bore the cross and impress of St Andrew. The badge of the Thistle, however, was not worn before the reign of James III. It was said that these emblems were not connected with any distinct order of knighthood previous to the reign of James V.

Subsequently this chivalric companionship was suppressed by the Reformers, and it was not till the reign of James VII. (II. of England) that the thistle and chivalry again bloomed together. The order is accessible to peers only. "A commoner," says a recent writer, "may have conferred more honour and service on his country than all the Scottish peers put together, but no amount of merit could procure him admission into the Order of the Thistle." Nevertheless, three commoners did once belong to it; but their peculiar merit was that they were heirs-presumptive to dukedoms.

Order of
the Gennet.

The first order of chivalry known in France was that of the *Gennet*, a species of *fouine*, or "wood-martin," once well-known and valued for its beautiful fur. When Charles of Aquitaine had defeated the Moors at Tours, in the year 726, he found in the camp which the invaders left behind them a large number, alive and dead, of those once valued, but now almost forgotten animals. In memory of the battle which he gained by the aid of "St Martin of the war," he built a church to the Saint, and founded the order of the *Gennet*, or "Wood-Martin," in his honour. The founder received, in return, the designation of the *Martel*, or "Hammer of the Saracens." The order consisted of sixteen knights, and it was held in high regard by the Carolingian kings, but became extinct after the accession of the Capetian race, when King Robert founded the Order of the Star, out of homage to the Virgin Mary, the star of the Sea. Although the *Gennet* was the first order or brotherhood known in France, it had not been unusual to reward that sort of valour, which was considered the peculiar distinction of a knight, in individuals. Thus, we read of Chilperic bestowing the bauldric, or girdle, as a reward for great courage. This bauldric is termed the "royal gift," a king alone having the privilege to bestow this jewelled girdle, which, by its mounting, differed from the plain gold girdles worn by such nobles as cared to put them round their loins. Although this order was instituted especially in honour of the Virgin, it became remarkable for the good eating and drinking of the companionship more than anything else. They had promised to be vigilant, but the insignia of the star and collar were given to the Chevaliers of the Watch, and the knights caroused while their deputies kept ward. Sumptuous, and even profligate, as some of those banquets were, we find that young princes waited at the table,—that is, if they had not been knighted; for it was a rule that no son, not of the order of chivalry, could sit down at the same table with a sire who was a belted knight.

French Or-
der of the
Thistle.

There was a French Order of the Thistle, which was, during a considerable period, of much celebrity. It was founded by Louis II., Duke of Bourbon, in 1463. The order was instituted on the duke's wedding-day, out of gratitude to the Virgin, who had endowed his highness with a bride of great beauty, to whom he behaved, as those mirrors of chivalry, the Guises, did to their wives, very "cavalierly." It was thought sufficient if a man were only exquisitely polite to the wife whom he shamelessly betrayed. When the merit of Louis XV. was noticed in a funeral oration, the reverend speaker said of that sovereign of the Order of the Holy Ghost, that however he may have lacked fidelity to his spouse, he never uttered a cross word to her.

The knights of the French Order of the Thistle were twenty-six in number. On the gold chain which they wore round the neck were interwoven links so fashioned and disposed as to form the word *Esperance*. From the chain was suspended an oval-shaped ornament of gold, in the centre of which, above a half-moon, stood the Virgin, surrounded by rays, and crowned with a coronet of twelve stars. From this oval hung a thistle blossom. The dress and the statutes of this order bore a close resemblance to those of the knights of the Order of the Garter.

The French Order of the Thistle was patronized, not

by St Andrew, but by our Lady. On the other hand, Russia has an order of St Andrew, which has no connection with the Thistle. The Muscovite order was founded by the Czar, Peter Alexiewitz, in the year 1698. It was at first conferred only on those who had borne themselves bravely against the Turks. Subsequently, they who had distinguished themselves in the Swedish wars were admitted; and finally, it was given indiscriminately to great soldiers and civilians of merit at home; and it often served to distinguish the officers in foreign courts who were in the interest of Russia. The knights carry a "St Andrew's cross," with the figure of the Apostle, with a smaller cross beneath, and above, an ornament rather complicated, but in which may be defined the double-headed eagle. A portion of the inscription of the original crosses stated, very characteristically, that the order was founded by "Peter, possessor and autocrat of Russia."

Russian
Order of
the Thistle.

We have already incidentally noticed the French Order of St Michael, which long since fell into disuse, through its honours being rendered too common and too cheap.

French Or-
der of St
Michael.

King Henry III. abolished the Order of St Michael, which had fallen into contempt, and created in its stead that of the Holy Ghost. The intention was good, but it failed of its end. It soon became overcrowded. One rule was, that no one could gain admission who could not show certain proofs of his nobility. This proved no safeguard. Candidates for admission forged papers without scruple, or produced whole cart-loads of titles from Italy, which the examiners passed without reading. The Marshal de Biron, in submitting his papers to the king, observed that his titles were set out therein, but that he had a better one at the point of his sword. One gentleman who could not prove his nobility, did as good, by presenting the king with a couple of puppies; and, as these were of a breed of dogs much prized by the monarch, he very appropriately clapped a collar on the neck of the donor.

The Order of St Louis was founded, or perhaps restored, on an ancient foundation, by Louis XIV. In process of time it became even more common than that of St Michael had been; and it was no unusual thing to see the diminutive cross of the order tacked to the button-hole of individuals who were hardly honest enough to pay for the coat on which sparkled the decoration.

Order of St
Louis.

The Legion of Honour has taken place of all the French orders, but it is, in truth, less a chivalrous body than a vast crowd of scattered members, who are not companions, in the knightly sense of the word, but who wear the cross in testimony of some particular merit—now, that of gaining victory on a stricken field, anon for a new fashion in very humble matters of dress. It is worn by monarchs and man-milliners; the classes being different, but the members of them being all alike legionaries.

Legion of
Honour.

We may here notice a few of those orders which have been remarkable for their singularity. Among them were the Knights of the Holy Ampulla, who were knights only for a day, and who carried the *Sancta Ampulla*, or holy chrysm, at the coronation of the kings of France. In contrast with these ephemeral knights may be noticed the *Ladies of the Axe*. This was a Spanish order, founded by Raymond Berengarius, count of Barcelona, at Tortosa, in 1148, in honour of those stout-hearted Aragonese ladies who beat back the Moors in a siege. The weapon which they wielded so effectually at the siege of Tortosa was figured on their cap and mantle. The members had several privileges. They took precedence, in all public ceremonies, of the men (a privilege which does not give satisfactory warrant of the general gallantry of Spain); they became, as widows, exempt from all taxes, and they inherited all jewellery and female ornaments, without partition of value with any of their brothers.

Miscellaneous
Orders.

The Moors had, before this, given rise to an order of

Knights
and
Knight-
hood.

chivalry—that of the Knights of the Oak. In the eighth century, Garcia, king of Navarre, was about to withdraw from before a large Moorish force, when he beheld a cross in an oak; believing this to be a sign from heaven, he charged victoriously, and, at the conclusion of a sanguinary conflict, founded that chivalry of the oak, the members of which were remarkable for their superstition and daring courage.

It was a different motive that created the “Order of the Brotherhood opposed to Cursing and Swearing,” or *vitandarum execrationum scurrilitatisque colibendæ causa Vimaræ sociæ*. This order was established at the close of the sixteenth century, by the Saxon dukes William and John, at Weimar. At this period hard drinking and unseemly language were prevalent in Germany; with great profession of piety, nevertheless, on the part of those whose practice was so discreditable. Licentiousness of speech was such a characteristic of table manners, that we read of banquets at which he who presided rang a bell fixed beneath the board, and when this sound was heard, the blaspheming guests were bound to bridle their profane tongues, and observe greater cleanliness of expression. It would seem that the noble-born who were distinguished for their purity were raised to companionship in this order, the symbol of which was a gold medal suspended from the neck.

Some orders have been founded on an error, as, for example, that of the Order of the Girdle of Hope, by Charles VI. of France, who, having lost his way when hunting, and found the right path again, attributed his good fortune to “our Lady,” and founded this order in her honour. Charles, however, was held by the theological heralds to have thereby done considerable wrong to St Hubert, who, if he had not sole sovereignty over woods and chases, yet was of such consequence, that no one wandering in their labyrinths could escape without his sanction and aid. George William of Leignitz, when he founded the Order of the Golden Stag, in 1672, in honour of a brilliant day, for which the duke was grateful to St Hubert, much better understood, according to the ideas of the time, where his gratitude was due.

There was more of marked singularity in the old Venetian Order of the Boot, which was founded in 1400, by the Duke Michael Steno, for the encouragement of youths in warlike exercises both by sea and land. The members of this order wore an embroidered boot, decked with precious stones, on either the right or left leg indifferently. The absurdity consisted in there being but one boot for each knight, but Michael Steno no more thought a pair of boots necessary for his chevalier than Edward did a couple of garters for his “companions” at Windsor.

The Emperor Sigismund of Germany is one of the few potentates who founded an order which died with the founder. On his return from the Council of Kostnitz in Hungary, in 1418, he founded the knightly brotherhood of the Overthrown Dragon. The members wore, suspended from a chain round the neck, the figure, in gold, of a dragon, overthrown, and with his wings flapping, crushed, and helpless. There were many who rightly read in this terrible hieroglyphic the stern resolution of the imperial grand-master and knights to pursue to the death John Huss, Jerome of Prague, and their followers.

St Michael was the patron of more than one order in Spain, founded out of gratitude for succour against the irreligious, particularly the Moors, or to invoke such succour. The Brothers of St Michael's Wing, with their device of *Quis ut Deus*, did good knight-service against the Moors, and rendered acceptable help to all sorely-pressed Christians in the bloody days of the fierce contests between the two antagonistic peoples.

Some princes have founded orders for the furtherance of friendship, but they seem to have been rather pleasant ca-

prices than anything more serious. So, Elizabeth Christina, Empress of Germany, founded, in the last century, at Vienna, the Order of Love for Your Neighbour. As the order was open to both knights and ladies, and as either lady or knight wearing the order could bestow the insignia once on a very dear friend, the wits had much to remark touching such regulations. These were subsequently modified; but the order, with its agreeable legend of “Amore Proximi,” was the desired object of many an aspirant. It was not the first of its class which arose, as fighting began to be a little less common than in days of old, and Christian people had more leisure to cultivate friendly relations.

There was a still more singular order, confined to knights only, and which is said to have peculiarly belonged to the house of Montmorency. The tradition relates, that after a feud, in which the King, Louis, sided with the Abbot of St Dennis against Bouchard Barberotte de Montmorency, first baron of France, a reconciliation having been established, Montmorency appeared before his sovereign with a company of knights, all of whom wore a thong (Hirsch-Geweihe), from which was suspended the figure of a dog. This was supposed to be a tacit assertion of their fidelity towards the king. The knightly brotherhood not only flourished, if the old chroniclers speak truly, but Montmorency is said to have founded a second, that of the Cock, and to have subsequently amalgamated the two. Of the order, however, either of Dog or Cock, very little is known, and that little is very doubtful. We suspect that the orders attributed to the house of Montmorency are as truly legendary as that of the Waning Moon, which romancers ascribe to St Louis in 1269; and which, it is added, though it ceased with his demise, was temporarily renewed by Charles of Anjou, when he obtained possession of Sicily. This order, we are told, was founded in opposition to the infidel Order of the Crescent, founded by Soliman II. Perhaps the most remarkable fact connected with the latter is, that the famous Christian painter, Gentilis Bellino, was a member of the order. At such a period, this showed more liberal toleration on the part of the Turkish sovereign than was exhibited by the King of France, in 1665, with respect to the Star of St Michael. Originally that order had been founded in opposition to the Garter and the Golden Fleece, but it was given to the most worthless, or sold to them, when foolish purchasers could be found. Even from an order so degraded as this, the king ejected all Protestants, and declared them incapable of wearing the brilliant insignia. Of a plainly-dressed Protestant of those days, standing in the midst of a glittering crowd of Knights of St Michael, might have been said what was said of Viscount Castlereagh, when he stood, the only man in a plain dress coat, amid the gilded and embroidered members of the Congress of Vienna, “Ma foi, il est très distingué!”

The history of comic companionships would require a separate, and not a very brief article. These, indeed, were not knightly orders, but societies founded in imitation of them, and with mirthful, though not always useless, ends in view. Of these we can only notice the principal; and first among them stands the Order of Fools, or Company of Simpletons, founded by Adolph Count of Cleves in 1381, for three dozen knights, who were bound by ordinances, the originals of which still exist in Germany. The “decoration” consisted of a small fantastic figure of a court fool, holding fruit in his hand, as a sign of the affection which the court's knightly fools were expected to bear the one to the other. They met in solemn assembly on the first Sunday after Michaelmas, and separated the Sunday following. From this meeting no member dared be absent, unless incapacitated by grievous illness, or engaged in business at a distance of six days' journey from Cleves. There were fines for non-attendance, and for not wearing the symbol of the Fool, but these were given to

and
Knight-
hood.

the poor, after being rigorously exacted by the king and council annually elected to preside over the order. If any members died between the anniversary meetings, it was the first business of the community to proceed to the cathedral and celebrate a mass in their honour, with abundance of prayer to rescue them from purgatory. The least foolish part of the ceremonial used by this "Company of Fools" was in their brotherly reconciliations. If two members happened to be at feud, they presented themselves before the king and council, during the grand assembly, on an appointed day, and embraced each other, before the sun went down. As peacemakers and charitable persons the noble members of this companionship were not such fools as they pretended to be. At a time when the soldier's vocation was the only one greatly honoured—when there was little equality among men, and compassion for the suffering was by no means general—it was no folly which moved the court to form a companionship in which every member was equal, the rulers being only nominally superior to their fellows, and the object of which was to reconcile the estranged, and to relieve the poor.

The "Dijon Infantry," or the "Mother of Fools," was a society early formed on the model of that of Cleves, and re-formed, in the fifteenth century, by Philip the Good, Duke of Burgundy. There was, however, no limit, whether with respect to number or quality of the members. These amounted to several hundreds, and among them were princes, bishops, dignitaries of parliament, artists, and tradesmen. The rules and the formulas of reception were in very rough rhymes. One object in view was to forget worldly cares over very sumptuous banquets, and another was to censure the views and criticise the sayings and doings of society generally. The order of the "Mother of Fools" met yearly about carnival time; and, in the dresses of labourers in vineyards, the members rode through the town, singing satirical songs as they went, and attracting universal attention in their green, red, and yellow costume, with bells on their two-pointed and tri-coloured caps, the *marotte*, or stick with a zany's head upon it, in their hands, and the sublime "Mother of Fools" leading the joyous and very mixed company. The officers were numerous, and over all waved the sacred banner, with the undeniable device, "Stultorum infinitus est numerus." This banner was protected by a guard of sixty knights; and the august person of the "Mater Stultorum" was surrounded by fifty chevaliers, selected from among the most skilful artists of the city. The processions were at once magnificent and burlesque; and the power acquired by the children of "La Mère Folie" was extraordinary. If a citizen offended a member of the order, he was summoned to answer the charge made in presence of the Mother, who was, of course, a man. If a citizen declined to appear, he incurred a fine. If he refused to pay the penalty, six officials were sent to compel him to obedience. These took up their quarters in a neighbouring town, where they lived at his cost, while they levied a distress on his goods, and sold them to the highest bidder, the law giving them this strange authority, and refusing to interfere in behalf of the recusant burgher. Such an order was likely to fall into lamentable excesses; and, as a consequence of these, the order was suppressed in 1630, though twenty years later the then surviving members were allowed to ride in procession, in order to carry up some compliment to the authorities. The last "Mother of Fools" was Philippe des Champs, procurator of parliament, and syndic of the states of Burgundy.

During the fifteenth and sixteenth centuries the "Societas Cornadorum," or Order of Hornbearers, flourished at Evreux and Rouen, under the auspices of the parliaments of Paris and Rouen. As the members of the order bore a hare's tail in the front of their caps, and wore a fox's brush round their necks, their proper appellation may have

been "Societas Caudinadorum," or Order of Tail-Bearers. The objects of the order were originally like those of the Dijon Infantry and the Mother of Fools; but these were forgotten, and, in the interest of morality, it became necessary to abolish the "Cornardi." The sole merit of this comic chivalry consists in the additions made by them to the stock of macaronic poetry, in which form they lashed vices in churchmen and people which they were not ashamed to practise themselves.

The "Kingdom of the Bazoche" was the high-sounding title of an order of French law-students, founded when the parliament of Paris was first established in that capital, and deriving its name from the Greek word *βαζέω*, which implies that sort of loquacity in which a lawyer does not always say what he thinks, but boldly pledges his conscience for the truth of an assertion, and deems the honour of the bar to be satisfied by calling it a "mere formula." This order, which had much to do with comic literature, was founded in 1303, and was suppressed in 1476, with all its plays, mysteries, recitations, and roystering festivals. Its constitution was on the knightly principle, and the grand-master was styled king. This title was not an uncommon one for the chief of any community. The company of mercers (in France) had their king. One of the stewards of the royal household bore the name in derision, perhaps of his office, that of a sort of provost over the lower servants of both sexes. At this day, too, Belfast has, not its "mayor," but its "sovereign." In more recent times the Order (or Regiment) of the Calotte in France was one of those companies which, for a while, tilted with points of satire against the follies and vices of mankind, as the knights used to do, more seriously, against the oppressors of the weak and the enemies of the faith.

But it is time to close this imperfect record; and we perhaps cannot do so more appropriately than by giving a chronological list of some of the principal orders under which chivalry has been most distinguished.

RELIGIOUS AND EQUESTRIAN-CHAPTER ORDERS.

1. St John of Jerusalem, subsequently Knights of Rhodes and of Malta..... A.D. 1043
2. The Knights Templars..... 1118
3. The Teutonic Order..... 1191
4. The Order of St Joachim..... 1755

PAPAL ORDERS.

About a dozen are ascribed to the popes at various times, but these seem to have been mere guilds. The sole exception is in the Order of the Golden Spur (1559), of which Gallini the ballet-master was made a knight by Pius VI. Lord Kenyon refused, in a court of law, to take his testimony as that of "Sir John Gallini;" but Coke had previously settled that a knight, by whomsoever created, remained a knight, all law to the contrary notwithstanding.

THE CHIEF IMPERIAL ORDERS.

1. St Constantine, originally of the Greek Empire, subsequently Neapolitan..... A.D. 313
2. St Andrew (and St Catherine) of Russia..... 1698
3. St George of Russia..... 1782
4. St Alexander Newskoi..... 1700
5. Maria Theresa (Austria)..... 1757
6. St Stephen of Hungary..... 1764
7. St Vladimir..... 1782

To these may perhaps be added, the Turkish *Crescent*, the Persian *Lion and Sun*, and the Legion of Honour (1802), which is not a military order exclusively, the cross being often conferred, as a medal is given to distinguish the wearer, without admitting him to knightly privileges. This order was founded by Napoleon I.

PRINCELY AND DUCAL ORDERS.

The orders of St Mark and of the Golden Stole of Venice, date from the earlier times of the Doges; added to these are—

The Golden Fleece	A.D. 1430
St Stephen of Tuscany	1561
Sincerity, or the Red Eagle of Bayreuth, subsequently the Red Eagle of Prussia	1705
Fidelity of Baden Durlach	1716
White Falcon of Saxe Weimar	1732
St Anne of Holstein (now Russia)	1735
The Chase of Wurtemberg	1719
Happy Alliance (Saxe Hildburgerhausen)	1749

KNOLLES, RICHARD, the author of a famous *History of the Turks*, was born in Northamptonshire about the middle of the sixteenth century; he studied at Oxford, and became master of the free school of Sandwich in Kent, where he died in 1610. He was the author of a *Latin-Greek Hebrew Grammar*, and of some minor works bearing chiefly on Oriental history. On his *General History of the Turks* he spent twelve years of his life. On the strength of this book Johnson, in a number of the *Rambler*, assigned to Knolles the first place among English historians. "His style," says the great critic, "though somewhat obscured by time, and sometimes vitiated by false taste, is pure, nervous, elevated, and clear." The verdict of Johnson is confirmed by Hallam; but a perusal of the work will satisfy most modern readers that these flattering criticisms are completely overcharged. There is a strong smack of ill-natured truth in the remarks of Walpole, who said that, as a history, the work was a tissue of fables, and, as a piece of style, one of the most wearisome books in the world, with weak sentences of a page long. Several continuations of the work have been published, the best being by Paul Ricaut, folio, London, 1680; but as a history it is now entirely superseded.

Spain has been most prolific in orders of chivalry, which have lived for a while, and then made way for others; the principal have been the Lily of Navarre, in the eleventh century; St Saviour in the twelfth century; the Holy Rosary of Toledo, and St George and Alfame in the thirteenth. In the following century were founded the orders of the Dove, the Croce della Scama, and the Scarf. The Lily of Aragon, in the fifteenth century, rivalled the renown of the ancient Oak of Navarre (722); and Spanish gallantry created the orders of St James, Calatrava, and Mercy, for the enrolment of ladies only.

With this list we dismiss the subject of Knights and Knighthood, quoting herewith the lines of Spencer, who, showing what knight *should* be, by what Sir Calidore *was*, says,—

"Nor was there knight, nor was there lady found,
In Fairy Court, but him did dear embrace,
For his fair usage and conditions sound,
The which, in all men's liking, gained place;
And, with the greatest, purchased greatest grace,
Which he could wisely use, and well apply,
To please the best, and th' evil to embase;
For he loathed leasing and base flattery,
And loo-ed simple truth and stedfast honesty."

(J. D—R—N.)

KNOX, JOHN, the great reformer of Scotland, was born at the village of Gifford in Haddingtonshire in the year 1505. His father is said, though perhaps without foundation, to have been descended from the family of Ranfurly, in the county of Renfrew. The name of his mother was Sinclair; and some of his letters, written in seasons of danger, were subscribed John Sinclair. Whatever might be the lineage or the situation of the father, the son was enabled to obtain the benefit of a liberal education, such as his native country could then afford. After having been instructed in the Latin language at Haddington School, he was, in the year 1521, sent to the University of Glasgow, where philosophy and divinity were taught by John Mair, a celebrated schoolman. The Greek and Hebrew languages were not then publicly taught in Scotland; but the former of these he acquired when he was yet in the vigour of life, and the latter during the period of his continental exile. It is not sufficiently ascertained that he took a degree; but if it be correctly stated that he publicly taught philosophy in this university, and afterwards at St Andrews, we are perhaps to infer that he was a master of arts.

He soon felt himself dissatisfied with the dry and barren speculations of scholastic philosophy and scholastic theology.

Knox. Not contented with the extracts "from ancient authors which he found in the writings of the scholastic divines and canonists, he resolved to have recourse to the original works. In them he found a method of investigating and communicating truth to which he had hitherto been a stranger, and the simplicity of which recommended itself to his mind in spite of the prejudices of education and the pride of superior attainments in his own favourite art. Among the fathers of the Christian Church, Jerome and Augustine attracted his particular attention. By the writings of the former, he was led to the Scriptures as the only pure fountain of divine truth, and instructed in the utility of studying them in the original languages. In the works of the latter, he found religious sentiments very opposite to those taught in the Romish Church, who, while she retained his name as a saint in her calendar, had banished his doctrine, as heretical, from her pulpits. From this time he renounced the study of scholastic theology; and although not yet completely emancipated from superstition, his mind was fitted for improving the means which Providence had prepared for leading him to a fuller and more comprehensive view of the system of evangelical religion." (M'Crie's *Life of Knox*, vol. i., p. 41, 5th edit.)

During the persecution which followed the spread of the reformed faith in Scotland, Knox was engaged in teaching philosophy in the university of St Andrews, though it does not clearly appear that he held the office of a regent or professor. Many persons of his acquaintance had embraced the reformed doctrines; but he did not openly profess himself a Protestant till the year 1542. As he began to recommend to his pupils a more rational and edifying method of study, he excited some suspicions of heresy; but when he proceeded so far as to expose certain corruptions of the church, he speedily found it necessary to change his place of residence. Having retired to the south of Scotland, and there avowed his adherence to the cause of reformation, he was declared a heretic, was degraded from his orders, and was even in danger of his life from the hand of the assassin, had he not found shelter under the roof of Douglas of Longniddry, a staunch Protestant like himself. Here he was retained in the capacity of a domestic tutor; and, as occasion offered, preached openly in the Protestant interest to the inhabitants of the surrounding district.

In 1546, when the martyrdom of George Wishart had been avenged by the murder of Beaton, Knox, though he had borne no hand in the cardinal's death, was one of the many unconcerned in it who took refuge in the Castle of St Andrews. During the siege of that stronghold by the royalist party under the regent Arran, Knox was persuaded to officiate as one of the chaplains of the garrison, and, by his labours among the citizens of the town, confirmed the waverers, besides gaining many new converts to the reformation. For more than a year the Protestants held their ground in St Andrews, till strong reinforcements from France enabled the besiegers to invest the place by sea and land. After a vigorous resistance they were compelled to accept terms of capitulation from Leo Strozzi, the commander of the foreign auxiliaries. It was stipulated that their lives should be spared, that they should be removed to France, and that such of them as declined entering into the French service should be conveyed to any other country except Scotland. Knox, sharing the fate of his companions, was conveyed on board one of the French ships to Rouen; but the terms of the capitulation were grossly violated, and, at the instigation of the pope and the Scottish clergy, the captives were treated as prisoners of war. The leaders were committed to close custody in Rouen, Cherbourg, Brest, and Mont St Michael; while Knox and some others were sent on board the galleys, and, after being loaded with chains, were compelled to labour at the oar. Here they were subjected to many other indignities; but,

in spite of every hardship and every threat, not one of their number could be impelled to renounce his faith. During the ensuing winter, the galley in which he was confined lay in the River Loire; and, in the summer of 1548, it sailed for Scotland, and cruised off the east coast, for the purpose of intercepting English vessels. The hardships to which he was now subjected produced a very serious effect upon his health: he was seized with a violent fever, and no hope was entertained of his recovery. He however regained his strength, and during his captivity had sufficient energy of mind to compose more than one religious treatise. His treatise on prayer, written during this season of affliction, was afterwards published. After a captivity of nineteen months, he was restored to liberty in February 1549. Of the circumstances which led to this event various accounts have been given; but, according to Dr M'Crie, "it is more than probable that he owed his deliverance to the comparative indifference with which he and his brethren were now regarded by the French court, who, having procured the consent of the parliament of Scotland to the marriage of Queen Mary to the dauphin, and obtained possession of her person, felt no longer any inclination to revenge the quarrels of the Scottish clergy."

Knox immediately directed his course to England, where his merits and his sufferings were neither unknown nor unregarded. Soon after he made his appearance in London, he received an appointment to officiate at Berwick, where he began to preach with his characteristic fervour and zeal. He exposed the errors of popery with an unsparing hand, and his labours seem to have been attended with no inconsiderable success. The tendency of his zeal was not, however, calculated to recommend him to the bishop of the diocese, Dr Tostall, who was strongly attached to the old faith. Having been accused of asserting that the sacrifice of the mass is idolatrous, the preacher was cited to appear at Newcastle on the 4th of April 1550, before the Bishop of Durham, and to give an account of his doctrine. In presence of a great audience, Knox entered into a full defence of his opinions, and with the utmost boldness proceeded to demonstrate that the mass is a superstitious and idolatrous substitute for the genuine sacrament of the Lord's supper. The bishop did not venture to inflict any ecclesiastical censure; and the fame of the obnoxious preacher was extended by this attempt to restrain the boldness of his attacks on the errors of Romanism. Having remained at Berwick till the close of the year, he was afterwards removed to Newcastle, and in December 1551 was appointed one of King Edward's chaplains in ordinary, with an annual salary of £40, which at that period was no mean provision. In the course of this year, the *Book of Common Prayer* was subjected to a revision, of which it stood in considerable need; and Knox having been consulted, among other divines, was chiefly instrumental in procuring a material alteration in the communion service, which at first was too favourable to the doctrine of the real presence. One vestige of this doctrine is still preserved in the kneeling posture of the communicants, which manifestly derives its origin from the popish adoration of the host.

The freedom of his discourses in the pulpit gave offence to various individuals, and among others to the Duke of Northumberland, warden-general of the northern marches; and having been accused of high misdemeanours, he was cited to appear before the privy council, which at that period possessed an extensive and ill-defined jurisdiction. But the malice of his enemies was completely foiled. Knox was fully cleared from every imputation of blame; and having been employed to preach at court, he made so favourable an impression on the young king that he expressed his anxiety to promote him in the church. It was resolved by the council that during the following year he should

Knox:

Knox.

preach in London and the southern counties. Having returned for a short time to Newcastle, he accordingly repaired to the metropolis in the beginning of April 1553. Archbishop Crammer had previously been directed by the council to present him to the rectory of All-Hallows; but Knox declared that in the existing state of the church he could not conscientiously accept of any preferment. He was again summoned before the council, where he gave an unreserved explanation of his sentiments on that subject. Nor could the promise of much higher promotion induce him to disregard the admonitions of a scrupulous conscience: the king, with the advice of his council, made him an offer of a bishopric; but instead of availing himself of so favourable an avenue to worldly honours, he declared the office of a bishop, as exercised in the English Church, to be destitute of divine authority. It is sufficiently evident that he considered that establishment as but imperfectly reformed from the errors of popery; and that, in his estimation, the new prelacy, retaining all the proud trappings, as well as the political character, of the old, was very widely removed from the simplicity of an evangelical church. The premature death of the king, on the 6th of July 1553, was fatal to the further progress of reformation, and a cloud of spiritual darkness again overshadowed the land.

During his residence at Berwick, Knox had formed a lasting attachment to Majory Bowes. Her father was Richard, the youngest son of Sir Ralph Bowes of Streatlam; her mother was Elizabeth, a daughter and coheir of Sir Roger Aske of Aske. The match was cordially approved by the mother of the young lady, but having been opposed by her father, it was not concluded till after a considerable interval. After the king's death, he had some intention of settling at Berwick, or in the immediate neighbourhood; but he soon discovered that he could not safely reside in a kingdom ruled by so bigoted and cruel a sovereign as Mary soon showed herself to be. He therefore sailed for France, and landed at Dieppe on the 20th of January 1554. Having lingered there till the last day of February, he pursued his solitary way through France, and arrived in Switzerland; but in the beginning of the ensuing month of May he retraced his steps to Dieppe, with the view of obtaining intelligence from his friends in England. At that period the intercourse between different countries was slow and precarious; nor was this the only occasion on which he returned to the same place for the same purpose. While he continued to reside on the Continent, he received remittances from his friends in Scotland as well as in England, but his means of life were neither certain nor ample. Geneva became for some time the chief place of his abode, and here his exile was cheered by the friendship of Calvin. The two reformers had embraced the same opinions with respect to the leading doctrines of the Christian faith, and in their personal character they exhibited several conspicuous points of resemblance. In their notions of ecclesiastical polity they preserved the same agreement; and the authority of Knox, supported by that of Calvin, has contributed to establish in this country a simple mode of discipline and worship, to which our ancestors adhered with unconquerable resolution, and in support of which many of them were found ready and willing to shed their blood.

The leisure which he enjoyed at Geneva was profitably spent in study, to which he devoted himself "with all the ardour of youth, although his age now bordered upon fifty. It seems to have been at this time that he made himself master of the Hebrew language, which he had no opportunity of acquiring in early life." Many pious and learned men had now been driven from England by the cruelty of Queen Mary, and most of them sought refuge in the Protestant states of Germany and Switzerland. Those who resorted to the imperial city of Frankfort were allowed the joint occupancy of a place of worship; and it was unani-

mously resolved to discontinue the use of the surplice, the litany, the audible responses, and some other superfluities which might rather excite the surprise than the approbation of their foreign brethren. Having determined to elect three pastors, they sent a letter of invitation to Knox, subscribed by twenty-one of their number, at the head of whom stands John Bale, the exiled Bishop of Ossory. It was not without some degree of reluctance that he consented to leave his retreat at Geneva; he however repaired to Frankfort in the month of November 1554, and entered upon the duties of his new charge, but his connection with this congregation proved a source of great uneasiness and mortification. Various dissensions, which arose among its members, were chiefly occasioned by a difference of opinion as to the propriety of adhering to the English service; and those dissensions were greatly fomented by Dr Cox, who had been preceptor to King Edward, and who afterwards became Bishop of Ely. In the progress of the controversy Knox appears to have acted with dignity and moderation, but the upholders of the liturgy were not easily diverted from their purpose. When all other expedients failed, two of their number, with the approbation of others, sought a private interview with the magistrates, and accused him of treason against the Emperor Charles, his son Philip, and his aunt the Queen of England. This extraordinary charge was founded upon certain passages in his tract published in 1554, under the title of *A Faithfull Admonition unto the Professours of Gods Truthe in England*. Of the futility of such an accusation the magistrates were sufficiently aware; but they nevertheless deemed it advisable for him to withdraw from Frankfort, and he availed himself of the suggestion which they conveyed to him. On the evening of the 25th of March 1555, he delivered a farewell discourse to about fifty members of the congregation; and on the following day they accompanied him several miles on his journey. He immediately returned to Geneva, and he experienced a cordial welcome from Calvin. There he continued till the month of August, when he again proceeded to Dieppe; and having embarked in a vessel bound for Britain, he landed near the eastern border of the two kingdoms about the end of autumn. On reaching Berwick, he found his wife and mother living in comfortable circumstances. With them he remained for some time, and afterwards pursued his journey to Edinburgh, where he took up his abode with a citizen named John Syme, to whose house the friends of reformation repaired as soon as they were aware of Knox's arrival.

Notwithstanding the rigour of the penal laws, the votaries of the Protestant cause were not entirely extirpated or dispersed. The Queen Dowager, Mary of Lorraine, having succeeded in her attempt to supplant the Earl of Arran, had been appointed regent on the 10th of April 1554. She was sufficiently disposed to continue the corruptions of the church, but several prudential considerations restrained her from pursuing more violent measures. Some of the Protestants who were driven from England by the atrocities of Queen Mary were permitted to live in Scotland without molestation, and even to meet, though with some degree of privacy, for the purpose of worshipping God according to the dictates of their own conscience. A comparatively small number of the population had as yet openly renounced the Romish creed; and of those who were most inclined to the Protestant doctrines very few had ventured to discontinue their attendance at mass. Knox was deservedly scandalized at this want of firmness and consistency: a meeting, attended by William Maitland of Lethington, and other leaders of the party, was held for the avowed purpose of discussing the lawfulness of such compliances; and Knox succeeded in his attempt to convince them that all participation in the worship of the Romish Church was to be avoided by those who were convinced of her gross errors. Nor were his ex-

Knox.

Knox.

ertions confined to the metropolis. He accompanied John Erskine of Dun to his seat in the neighbourhood of Montrose; and during a visit of a month he preached every day, being attended by the principal persons of the adjacent district. On his return to the south, we find him residing at Calder House, the seat of Sir James Sandilands, afterwards Lord Torphichen, an early, zealous, and consistent friend of the Reformation. In the hall of this baron, who was preceptor in Scotland of the Knights of St John of Jerusalem, he preached and administered the communion. Here his ministrations were attended by several persons of distinction; and among these were Archibald Lord Lorne, afterwards Earl of Argyle, John Lord Erskine, afterwards Earl of Mar, and James Stewart, Prior of St Andrews, afterwards Earl of Moray, all of whom received religious impressions, which influenced the future course of their lives. Early in the subsequent year, 1556, he was accompanied to the district of Kyle by Lockhart of Dunbar, and Campbell of Kineancleuch. This division of Ayrshire had been the principal seat of the Lollards in Scotland, and it then contained many friends of the purer religion. They were not, therefore, unprepared for his reception: he preached not only in the town of Ayr, but likewise in the houses of Bar, Kineancleuch, Carnell, Ochiltree, and Gadgirth, and in several of these places the holy communion was now dispensed. Before Easter, he paid a visit to Finlayston, the residence of Alexander Earl of Glencairn, one of the most strenuous friends of the Reformation. In this baronial castle he also preached and administered the sacrament. Returning to Calder House, he next determined to visit his friends in the north; and during his second residence at Dun he was emboldened to preach in a more public manner. Many gentlemen of that vicinity made an open profession of the reformed faith; and, in order to strengthen their cause, they entered into a solemn engagement to renounce the communion of the Popish Church, and, to the utmost of their ability, to promote the pure preaching of the gospel. "This," says Dr M'Crie, "seems to have been the first of those religious bonds or covenants by which the confederation of the Protestants in Scotland was so frequently ratified."

As he now began to preach more openly, the ecclesiastics felt a natural alarm for the safety of a tottering church; and the friars testified their zeal by urging the bishops to proceed with rigour against such an offender. He was accordingly cited to appear before an assembly of the clergy, to be held at Edinburgh in Blackfriars Church, on the 15th of May; but when they found that he did not shrink from this discussion, and that he was supported by some persons of influence, they sought a pretext for superseding the citation on the ground of its informality. On the very day which had been appointed for his appearance he preached in the Bishop of Dunkeld's house to a much larger auditory than had previously attended him in Edinburgh; and during the ensuing ten days he regularly preached twice a-day in the same place, without being exposed to any molestation. About this period the Earl Marischal attended one of his evening discourses; and it may be regarded as a proof of his favourable impression, that he united with the Earl of Glencairn in an earnest request that Knox would address to the Queen Regent such a letter as might induce her to extend her protection to the Protestant preachers. A letter was accordingly addressed to her, and it was delivered by the Earl of Glencairn; but it does not appear to have produced any change in her sentiments. This letter he afterwards published, with some additions. In the meantime, he received from the English congregation at Geneva an invitation to become one of their pastors. He readily listened to their call, and made arrangements for removing thither, accompanied by his wife, as well as by her mother, who had now lost her husband. He embarked them on board a vessel bound for Dieppe, and paid another visit

to the several places where he had disseminated the truth of the Gospel. He visited the Earl of Argyle at Castle Campbell, and there he repeatedly preached to such an auditory as could be assembled. Having thus made no inconsiderable progress in preparing his countrymen for a more general reception of the reformed doctrines, he took his leave in the month of July 1556, and joining his family at Dieppe, he again directed his course to Geneva. His colleague in his new office was Christopher Goodman, B.D., an Englishman, who afterwards became a clergyman of the Church of Scotland. Their congregation chiefly consisted of the exiles who had withdrawn from Frankfort in consequence of the dissensions already mentioned. The two pastors lived together on terms of the greatest cordiality. Knox likewise enjoyed the friendship of Calvin and Beza; and the two years which he spent in this vocation are described as the most tranquil of his public life. At this period was published a directory for worship and discipline, frequently described as the Order of Geneva; but it had been composed at Frankfort by Knox, Whittingham, Fox, Gilby, and T. Cole. The same directory was afterwards adopted by the Reformed Church of Scotland.

When the Scottish clergy were apprised of his having quitted the kingdom, they renewed the citation for his appearance; and those who had no inclination to encounter such a disputant now found themselves at liberty to proceed against him as a contumacious heretic. He was accordingly condemned to suffer death by fire; and as the sentence could not be executed on his person, it was executed on his effigy, which was in due form committed to the flames at the cross of Edinburgh. From this sentence he prepared an appeal, which was afterwards printed under the title of *The Appellation of John Knoxe from the cruell and most unjust sentence pronounced against him by the false Bishoppes and Clergie of Scotland*. In the course of the year which followed his return to Geneva, two citizens of Edinburgh, James Syme and James Baron, were the bearers of an invitation for him to resume his evangelical labours in his native country. They were furnished with credentials from the Earl of Glencairn, and the Lords Erskine, Lorne, and James Stewart. After consulting Calvin and the other ministers of Geneva, he determined to devote himself to this honourable and dangerous service; and he again pursued his way to Dieppe, where he arrived in October 1557. He had, however, the mortification of receiving letters which entirely disconcerted his plan; for he was informed that some of the Protestants already repented of the invitation which had been sent to him, and that the great body of them seemed to waver in their purpose. He lost no time in addressing a letter to the noblemen who had subscribed the credentials; and it may easily be supposed that he did not fail to upbraid them for their want of firmness and consistency. In a similar strain, he likewise wrote to Erskine of Dun, Wishart of Pittarow, and to some other individuals of the Protestant party. He lingered in France to await the course of events; and as he was familiarly acquainted with the French tongue, his talents as a preacher were not in the meantime unemployed. About this period he paid a visit to Lyon, and he is known to have preached at Rochelle. A Protestant congregation had recently been formed at Dieppe; and he was now elected one of its pastors, being associated with Delaporte. So successful were their exertions, that some of the principal persons of the town were induced to renounce Popery, and a general improvement began to be produced in the morals of the inhabitants. Discouraged by the aspect of affairs in Scotland, he at length determined to revisit Geneva, where he again made his appearance in the beginning of the year 1558. It was at this period that some of the most learned members of his congregation were engaged in preparing an English version of the Bible, and he is said to have had some share

Knox.

Knox. in the undertaking. The New Testament was printed at Geneva in 1557, and the entire Bible in 1560. This version, commonly called the Geneva Bible, is allowed by competent judges to possess great merit; and in the opinion of Dr Geddes it is generally superior to the version executed under the authority of King James. Of the former version, says Dr M'Crie, it is evident that his translators made great use; "and if they had followed it still more, the version which they have given us would, upon the whole, have been improved."

In the course of the year 1558 Knox published three different works. One of these was the *Appellation*. Another, which has also been mentioned in a former page, was *The Copie of a Lettre delivered to the Ladie Marie Regent of Scotland*. The third and most remarkable of these tracts bears the title of *The First Blast of the Trumpet against the Monstrous Regiment of Women*. This anonymous work, directed against the political government of females, attracted a very considerable degree of attention. It was speedily answered by John Aylmer, who in due time became Bishop of London. The doctrine of Knox as to the inexpediency of female rule was afterwards controverted by David Chalmers of Ormond, and by John Lesley, Bishop of Ross. Whatever opinion may be formed of his theory, it must at least be admitted that, either in England or Scotland, he had seen nothing to reconcile him to the practice; and, in one of those countries, the regimen of a woman might with too much justice be termed monstrous. His literary labours were interrupted by the renewal of an invitation from the Scottish Protestants; and, at the beginning of the year 1559, he bade a final adieu to Geneva, having previously been presented with the freedom of the city. Leaving his family behind, he once more proceeded to Dieppe, where he arrived in the month of March; and, having ascertained that he would not be permitted to pass through England, he embarked for Leith on the 22d of April, and was safely landed on the 2d of the following month.

The Popish Church of Scotland was now approaching its crisis, which the presence of Knox had no small tendency to hasten. The queen regent, who for some time thought it necessary to dissemble her real sentiments, had lately evinced a fixed resolution to oppose the Reformation with all the weight of her authority; and Walter Mill had been brought to the stake by Hamilton, the profligate archbishop of St Andrews. The death of the English queen (17th Nov. 1558) produced considerable influence on the affairs of the neighbouring states, and the queen regent was prepared to adopt the most violent measures. Several of the preachers, Willock, Harlow, Methven, and Christison, were cited to appear at Stirling before the High Court of Justiciary on the 10th of May, that is, eight days after Knox's return; and very soon after his arrival had been announced to Mary he was proclaimed a rebel and an outlaw. The four preachers were outlawed for non-appearance, and a fine was levied on their sureties. After remaining a single day in the metropolis, he hastened to Dundee, where the chief Protestants of Angus and Mearns were then assembled. They proceeded to Perth, and there he preached a sermon against the idolatry of the mass and of image-worship. After the conclusion of the service a riot was casually excited among the common people; and, before it was terminated, the monasteries of the Dominican and Franciscan friars, with that of the Carthusian monks, were totally demolished. The queen, who was probably glad of such a pretext, collected a considerable army, and advanced upon Perth; but she found the Protestants so well prepared for resistance that she did not hazard an attack. She proposed and ratified terms of accommodation, which she speedily showed a strong disposition to disregard. In order to ascertain the strength of their party, and to conso-

lidate its union, they formed a religious bond or covenant, which received many signatures in different parts of the kingdom. From this period they began to be distinguished by the name of the Congregation; and their noble leaders were commonly described as the Lords of the Congregation.

On his return from Perth, Knox preached at Anstruther and Crail. Disregarding the admonitions of his friends, and the threats of the archbishop, he next preached in the cathedral of St Andrews, having selected the appropriate subject of our Saviour's driving the profane traders from the holy temple. On the three ensuing days he lifted up his warning voice in the same place; and so signal was the success which attended his efforts, that the magistrates and the inhabitants resolved to establish the reformed worship in that city, the pictures and images were removed from the churches, and, on the 14th of June, the monasteries were defaced. He reached the capital in the end of the same month: on the day of his arrival he preached in St Giles's, and on the following day in the Abbey church. On the 7th of July, the body of the Protestant inhabitants of Edinburgh elected him as their minister. His wife joined him from Geneva; and her mother likewise came to end her days in Scotland. But he was soon disturbed in his new functions, in consequence of the military occupation of the city by the troops of the queen regent. He now made an extensive circuit in the southern and eastern districts of the kingdom, visiting Kelso, Jedburgh, Dumfries, Ayr, Stirling, Perth, Brechin, Montrose, Dundee, and St Andrews; nor can we doubt that the impressions produced by such a missionary were great and beneficial. After this period he was deeply engaged in the political as well as the ecclesiastical transactions of the Congregation; and the vigour of his talents, with the decision of his character, was conspicuously displayed in the steps which led to the establishment of the reformed religion. Knox, as well as Willock, concurred in advising the suspension of Mary from the office of regent. For the space of twelve months the kingdom was a prey to a civil war, in which French and English troops supported their respective allies. The contest, which had not been marked by many of the usual atrocities of intestine warfare, terminated in the month of July 1560. Parliament soon afterwards assembled; and in the course of a few days the reformed religion was established by the authority of the legislature.

Knox, after officiating for several months in St Andrews, had returned to Edinburgh at the end of April, and continued to exercise his functions during the siege of Leith. Before the close of the year, he was visited with a severe domestic affliction in the loss of his wife, who left two children of tender years. The young queen returned from France on the 21st of August 1561. Not many days after her arrival she sent for the reformer, of whose powerful influence she must have been fully aware; but neither this nor any of their subsequent interviews produced the effects which she seems to have anticipated. Such topics as Mary introduced he discussed with undaunted freedom, though it cannot with justice be affirmed that he treated her with incivility. She certainly did not overawe him with her royal presence, or render him less disposed to use his utmost endeavour in destroying the fabric of ancient superstition.

At this period the metropolis of Scotland contained only one parish church. Knox was at first assisted by a reader, named John Cairns. It was then his regular practice to preach twice every Sunday, and thrice on other days of the week; but in 1563, John Craig, minister of Canongate, was appointed his colleague. In 1562, he had for three successive days been engaged at Maybole in a public disputation with Quintin Kennedy, abbot of Crossraguel; and, in the course of the following year, an account of it was printed at Edinburgh, under this title: *Heir followeth the*

Knox.

Knox.

Coppie of the Ressoning which was betuix the Abbote of Crosraguell and John Knox. Another learned Catholic, Ninian Winzet, addressed to him a *Buke of fourscoir thre Questionis*, to which it was his intention to publish an answer, though he seems to have been prevented by his other avocations, which were sufficiently numerous. After this period he incurred the hot indignation of the queen for having, in one of his public discourses, animadverted with great freedom on her intended marriage. During one of their interviews she wept bitter tears of anger; and some modern historians have been not a little scandalized at his want of gallantry. In the month of December 1563, he was summoned before the Privy Council on a charge of high treason, for having written a circular letter to the Protestant gentlemen in reference to the trial of two persons who had been indicted for a riot in the chapel royal. Of this charge he was fully acquitted, to the great disappointment of Mary and the Popish party.

After having continued a widower for more than three years, he married Margaret Stewart, daughter of the good Lord Ochiltree. This marriage took place in March 1564, when he had attained the age of fifty-nine. The noble family with which he thus became connected was descended from Robert Duke of Albany, second son of King Robert the Second. Knox was again brought before the Privy Council, for having, in a sermon preached in St Giles's on the 19th of August 1565, used certain expressions, or rather quoted certain texts, which gave great offence to the king, who was present, and applied them to himself. He was for a short time prohibited from preaching. Early in the following year, Mary subscribed the Catholic league for the extirpation of the Protestants; and if she had not been controlled by several prudential considerations, she seemed sufficiently prepared to adopt extreme measures. When she returned from Dunbar, soon after the death of Rizzio, he retired from Edinburgh, and sought refuge in Kyle; nor does he appear to have resumed his pastoral care till after the final overthrow of her authority. Towards the close of the year he prepared to visit England, where his two sons were residing with some of their mother's relations, for the purpose of receiving their education. He appears to have returned home soon after the queen had plunged herself into ruin by her marriage with Bothwell. He was a member of the General Assembly convened at Edinburgh on the 25th of June 1567; and he preached a sermon at the coronation of the young king, which took place at Stirling on the 29th of the ensuing month. The assassination of the Regent Moray, and the civil troubles which ensued, depressed his mind and affected his health; in October 1570 he felt a stroke of apoplexy, which, however, was of so mitigated a kind that he was able to appear in the pulpit; but his strength was greatly impaired by his unceasing exertions, and he never recovered any considerable degree of vigour. Before the end of that year the freedom of his animadversions in the pulpit gave such deep offence to Kircaldy, governor of the castle, that at length he found it expedient to change his habitation. He quitted the metropolis on the 5th of May 1571, and retired to St Andrews, the scene of his early labours. Here, in the following year, he published *An Answer to a Letter of a Jesuit named Tyrie*. In a state of great debility he returned to Edinburgh towards the end of August 1572; and on the 24th of November he closed his most laborious and most honourable career, after having attained the age of sixty-seven. He left two sons by the first, and three daughters by the second marriage. Both his sons studied at St John's College, Cambridge, and both of them became fellows. Nathaniel, the elder of the two, took the degree of A.M., and died in the year 1580. Eleazar, the younger son, proceeded B.D., and was one of the preachers of the university. Having been collated to

Knox.

the vicarage of Clacton-Magna, he died in 1591, and was buried in the college chapel. The three daughters, named Martha, Margaret, and Elizabeth, were married to three clergymen, James Fleming, Zachary Pont, and John Welsh. The widow of Knox became the wife of Sir Andrew Ker of Fadounside, who is described as a strenuous supporter of the Reformation.

The vigorous and ardent mind of Knox was lodged in a diminutive and feeble body, which had been wasted by various hardships, and by intense mental exertion. His natural talents were improved by no mean attainments of learning, and he was eminently distinguished by an impetuous and impressive eloquence, which gave him a great ascendancy among his countrymen. That he was a man of fervent and habitual piety, will not be disputed by any one whose prejudices do not prevent him from forming a correct estimate of his character. From an early period of his life he devoted his entire energies to the best of all causes; and, in the hand of Providence, he was the great instrument which rescued his countrymen from the fangs of papal tyranny and superstition; nor is any other name entitled to be mentioned with equal honour in the annals of Scottish history. Of civil as well as ecclesiastical tyranny he was a decided enemy; and his writings contain some bold speculations on the subject of government. No man was more upright in his intentions, or more disinterested in his motives. That the impetuosity of his character occasionally impelled him beyond the bounds of moderation may be fully admitted without any diminution of the respect due to his name; he was placed in a situation which required great energy and decision; and a person chiefly distinguished by the gentler virtues would have been very indifferently qualified to encounter the boisterous elements with which he was destined to contend. It is not to be concealed that he was not exempted from that spirit of intolerance which, in a greater or less degree, belonged at that period to every sect and denomination of Christians. He was as little disposed to tolerate the mass as the mass-priests were to tolerate those whom they termed heretics. The principles of mutual toleration were little understood or relished; and almost every one who possessed the power, betrayed the inclination of imposing, by very ungentle means, his own creed upon his neighbours.

Beside the works which have already been mentioned, he composed various others, which are accurately enumerated by his biographer. "His practical treatises," says Dr M'Crie, are among the least known, but most valuable, of his writings. In depth of religious feeling, and in power of utterance, they are superior to any works of the same kind which appeared in that age. The thoughts are often original, and always expressed in a style of originality, possessing great dignity and strength, without affectation or extravagance." The work by which he is best known as an author is *The Historie of the Reformation of Religion within the Realm of Scotland*. So early as the year 1586, an octavo edition of it, to the extent of twelve hundred copies, was undertaken in England by Vautrollier, a well-known printer; but when ready, or nearly ready, for publication, it was seized by the command of Archbishop Whitgift. Some imperfect copies, all of them wanting the beginning and the end, have however survived this visitation of the Protestant inquisitor. An edition was afterwards published by David Buchanan, who has taken very unwarrantable liberties with the text. Lond. 1644. fol.; Edin. 1644, 4to. He has suppressed various passages, and interpolated others; and the fifth book, which has not been found in any manuscript, is perhaps his sole composition. A genuine edition, "taken from the original manuscript in the university library of Glasgow," was at length published by Matthew Crawford, professor of ecclesiastical history in the university of Edinburgh. Edin. 1732. fol. A col-

Knutsford lective edition of his works has been edited by David Laing, in 4 vols. 8vo, Edin. 1846-55. (D. I.)

Kniah.

KNUTSFORD, an ancient market-town of Cheshire, so called, it is said, after Canute the Dane, who forded with his army the stream which passes through the town. Pop. 3127; partly employed in silk and cotton handloom weaving.

KODIAK, or КАДЯК, a large island of Russian America, to the N.E. of the Aleutian group, among which it is sometimes included. It is separated from the mainland of Alaska by the Straits of Cheligoft, and is about 100 miles long by 50 in breadth. The general surface is very mountainous, and in the interior thickly wooded; the valleys are well watered, and the soil and climate are superior to those of the neighbouring islands. The coast, which abounds in whales, seals, &c., is indented by numerous bays; in the N. is the harbour and station of St Paul, the principal fur depôt of these islands.

KOLOMNA, a town in the Russian province of Moscow, on the River Kolomenka, at its junction with the Moskwa, 66 miles S.S.E. of Moscow. It carries on an active trade between Moscow and the neighbouring country, and has manufactures of linen, cotton, silk, and woollen stuffs, leather, tallow, &c. Pop. (1850) 12,598.

KOMORN, or COMORN, a royal free city of Hungary, capital of a cognominal county, is situated on a point of land formed by the junction of the Waag with the Danube, and constituting the eastern extremity of the island of Schütt. The fortress of Comorn, founded by Mathias Corvinus in the fifteenth century, has been rebuilt and strengthened since 1805, and is now one of the strongest in Europe. It has never been taken; and in 1848-9 it successfully resisted all the efforts of the Austrian army. The town itself is irregularly built, and the streets are narrow and dark. It has four Roman Catholic churches, one Greek, one Lutheran, and one Reformed church, a Jewish synagogue, a Roman Catholic and a Protestant gymnasium, and two theatres. Komorn is a steam-packet station, and carries on an extensive trade in grain, wine, timber, and fish. Pop. (1851) 19,113.

KONGSBERG, a mining-town of Norway, stift of Aggerhuus, on the Louven-Elf, 43 miles W.S.W. of Christiania. It is the seat of a mining directory, and has a mining school, a royal manufactory of firearms, and government powder-mills. The silver mines in the vicinity, discovered in 1623, are the most important in the kingdom. Pop. about 4000.

KONIAH, or KONTYEH (the ancient *Iconium*), a city of Asia Minor, capital of the pashalic of Karamania, in a wide plain, about 300 miles S.E. from Constantinople. N. Lat. 36. 54., E. Long. 32. 40. It is surrounded by walls, which are flanked with towers, and by a wide fosse. The walls, about 2 miles in circumference, were built by the Seljukee sultans, in the thirteenth century, of materials taken from more ancient edifices. The figures in *alto relievo* ornamenting the gates are said by Kinneir to be among the finest in Turkey. Koniah now presents little to the eye of the traveller but the ruins of its former greatness. The numerous monuments in the Saracenic architecture fully attest that under the Seljukee sultans it had been a town of great celebrity and sanctity, as well as a seat of learning. There are remains of upwards of twenty *medreschs*, or colleges, a number nearly equal to that of Baghdad. In the modern part of the town the houses are low, and are mostly built of sun-dried bricks and wood. There are several bazaars, mosques, colleges, public baths, and khans, and two Armenian churches. Among the mosques the finest is that of Sultan Selim, built on the model of that of St Sophia at Constantinople. There is here the tomb of a Moslem saint, held in the highest veneration all over Turkey. The manufactures are in a very languishing state, and are confined to carpets and morocco

VOL. XIII.

leather. Pop. about 30,000. Ibrahim Pasha completely defeated the Turks here on 21st December 1821. See *ICONIUM*.

Konigsberg.

KÖNIGGRÄTZ, a fortified town of Bohemia, capital of a cognominal circle on the Elbe, at the mouth of the Adler, and 6 miles E.N.E. of Prague. It is the seat of a bishop, and has an elegant cathedral, Jesuit's college, episcopal seminary, gymnasium, orphan asylum, large barracks, and theatre. The chief manufacture is woollen cloth. Pop. about 9000.

KÖNIGSBERG, a city and seaport of Prussia, capital of the government of the same name, and of the province of E. Prussia, is situated on both banks, and on an island in the centre of the Pregel, about 4 miles from its mouth. It is divided, exclusive of suburbs, into three parts, originally distinct towns, each with its own magistrates; the Altstadt, or old town, the Löbenicht, both on the N. side of the river, and the Kneiphof, on the island. The two former occupy an elevated site, consisting of seven low hills; the latter is built on piles, the island being swampy. Seven wooden bridges connect the various parts of the city. It is strongly fortified, and since 1843 the fortifications have been greatly increased. The general aspect of the city from a distance is sufficiently imposing, but a nearer view reveals the irregularity and meanness of the streets and the paucity of fine public buildings. The most interesting of the latter is the cathedral, in the Kneiphof, a fine Gothic building of the fourteenth century, containing the monument of Margrave Albert, and the tombs of many Teutonic knights. The palace (*Schloss*), an ungainly but venerable pile, founded in 1257 by King Ottocar of Bohemia, afterwards the residence of the Teutonic grandmasters, and in the present century of Frederick William III. and his queen, when driven by Napoleon from Berlin, is now used as the government house. In the palace church the first Frederick placed the Prussian crown on his own head; the walls are covered with the names of men who fell in the war of 1813. Above it is the Muscovite Hall, 300 feet long, 60 broad, and 19 in height, without pillars or ornament. Near the cathedral is the Albertine University, founded in 1554 by Margrave Albert, having about 50 lecturers and above 300 students; connected with it is a library of about 50,000 volumes, a museum, a botanic garden, and observatory. There are two theological academies, three gymnasia, and a public library of 160,000 volumes. In the *Königsgarten*, or Parade, is a fine equestrian statue of Frederick William III., in bronze, by Kiss. The trade of Königsberg, which has declined in the present century, is chiefly in corn, hemp, flax, linseed, tallow, &c. Amber was formerly an important article of trade; it is still exported in small quantities. There is not depth of water for large vessels nearer than Pillau, at the mouth of the Frisches-Haff, a flourishing place of 4000 inhabitants, about 24 miles from Königsberg. A large proportion of the trade is with Britain. The principal manufactures are woollens, silks, leather, soap, refined sugar, sailcloth, iron and steel ware, &c.; there are also extensive breweries, distilleries, and building yards.

Königsberg ranks third among Prussian cities, being preceded only by Berlin and Breslau. Its foundation is due to the Teutonic Knights, who erected a fort here in 1225. It joined the Hanseatic League in 1365, and was, from 1457 to 1528, the residence of the Teutonic grandmaster. In 1657 it came into the possession of the Elector of Brandenburg, who made it his capital. The Russians occupied it from 1758 to 1764, and the French in 1807, when it suffered greatly. Of distinguished natives of the town the most celebrated was the metaphysician Kant, who never wandered 20 miles from the city during a life of eighty years. His house, No. 3 Prinzessin Strasse, is still shown; his tomb is in a porch outside the cathe-

R

Königstein dral. In Latin the town is called *Regiomontum*, or *Mons Regius*.

Koräes.

KÖNIGSTEIN, a small town of Saxony, on the Elbe, 17 miles S.E. of Dresden. Above it, at an elevation of 779 feet from the river, towers the hitherto unimpregnable fortress of Königstein, the retreat, in all cases of extreme danger, of the Saxon monarchs and their treasures. Its strength is due mainly to its lofty and isolated position, the nearest height being 3000 yards distant, as well as to the solid and precipitous nature of the surrounding rock on which it stands. The gateway is high up the cliff, and is approached by a slanting way cut through the rock, and by a wooden draw-bridge. Two years' provisions for 1200 men are always kept stored, in time of war, in vast casemates hollowed out of the rock. There is an inexhaustible supply of water from a well bored in the rock to the depth of several hundred feet, and the plot of land that surrounds the fortress produces some corn and vegetables, and pasturage for one or two cows. The last occasion on which this place became an asylum for distressed loyalty was in 1849, when the king lived here three months. Packing-boxes are kept always ready for conveying the most valued treasures of Dresden to Königstein in case of danger.

KOOM, a town of Persia, province of Irak-Ajemi, an extensive plain 60 miles S. by W. of Teheraun. It was built by the Saracens, about the beginning of the ninth century; it afterwards became one of the finest cities in Persia, and was long celebrated for the manufacture of silks. It was taken, and all but completely destroyed, by the Afghans, on their invasion of Persia in 1722. Part of it has since been rebuilt, but it still has the appearance of a vast ruin. Cloth, cutlery, soap, china, and glass are made here; and the bazaars are large and well supplied. There is a very beautiful and celebrated mosque, erected to the memory of Fatima, the daughter of Imâm Reza, and containing the tombs of Sofi I. and Shah Abbas II. Pop. about 10,000.

KOONDOOZ, a khanat of Independent Turkistan, lying between N. Lat. 35. 38., E. Long. 68. 72., and having N. the territories of Hissar, Durwaz, &c., E. the Bolor Mountains, S. Afghanistan, and W. Bokhara. The greater part of the surface is mountainous, but a considerable portion of it is also marshy, so that in many parts the roads are obliged to be constructed on piles of wood. The marshy parts produce excellent crops of rice, while wheat and barley are largely cultivated in the drier tracts. Fruits are abundant, as are also generally all the necessaries of life. Silk is an important product. The climate, however, is very unhealthy, arising partly from the marshy character of the surface, and partly from the great variety of temperature. The heat in summer is frequently excessive, while in winter the snow lies for three months in the year. The indigenous inhabitants are Tanjiks, but the khan and his dominant party are Usbeks. An active trade is carried on with the Chinese province of Yarkad, and with Bokhara. Slaves constitute a large article of export from Koondooz.

KOONDOOZ, the capital of the above khanat, is situated in a wide valley near the confluence of two rivers, about N. Lat. 36. 48., E. Long. 69. 20. It is a wretched place, of some 500 mud hovels. It has a fortress, surrounded by a mud wall and dry ditch, and a citadel, the winter residence of the khan.

KORÄES, DIAMANTES, or, as he himself used to write his name in French, DIAMANT CORAY, the greatest philologist of modern Greece, and one of the best Greek scholars of his age, was born at Smyrna, April 27, 1748. At a wretched school in his native town, where, as he himself says, the birch and the cane were the only things much in vogue, he picked up a little Greek, French, and Italian. His father, himself a merchant, intended him for commerce, and in 1772 sent him to Amsterdam, to establish there a

branch of his own business. He remained in Holland for six years. On his return home, at the end of that period, he was shocked at the general prostration of Greece and the Greeks under the misgovernment of the Turks. He determined to leave his country, and, in 1782, fixing upon Montpellier in France as his residence, he plunged into the study of medicine. Immediately after graduation in 1788 he repaired to Paris, where he watched with intense interest the progress of the revolution, and dared to hope that his own enslaved country might also be roused to assert its ancient freedom. The design of his writings during many years was to kindle the torch of freedom in Greece itself. To do this three things were needed: to teach the Greeks their own political condition, and bring it under the notice of the other nations; to revive the thoughts and language of their own ancient classics; and to improve the common speech, by purging it of the solecisms which had crept into it in the course of ages. In his own person he united the three functions of political writer, editor of the old Greek classics, and legislator of the modern Greek tongue. The first work by which he made himself widely known was his edition of the *Characters* of Theophrastus, with a translation into French by himself, and some valuable notes and discussions. The work was dedicated to the free Greeks of the Ionian Sea, and the expense of it was defrayed by a rich Greek merchant of Leghorn. The next of his Greek-French works was his edition of Hippocrates' essay on *Climate, Water, and Locality*, which work was immediately translated into German and Spanish, and to which, in 1810, the Institute of France awarded the prize of 5000 francs. In 1802 Coray published a translation into modern Greek of Beccaria's treatise *Dei Delitti e delle Pene* (On Crimes and Punishments), which he dedicated to the newly constituted republic of the seven Ionian Islands. He followed it up next year with his *Mémoire sur l'état actuel de la Civilisation dans la Grèce*, which he published both in French and modern Greek. His aim in doing so was to familiarize the Europeans of the west with the social and moral condition of Greece, and to point out to the Greeks the true means of raising themselves in the scale of nations by a sound system of education. At the instance of Napoleon, Coray undertook, along with Laporte du Thuil and Gosse- lin, a new translation of *Strabo's Geography*. To this important work Coray contributed the third, fourth, seventh, eighth, twelfth, thirteenth, fourteenth, and fifteenth books, and the great body of the appended notes. About this time he contributed important matter, in the form of annotations to Levesque's *Thucydides*, to Larcher's *Herodotus*, and to Schweighäuser's *Athenæus*. In 1804 he conceived the idea of a "Hellenic Library," which should embrace those Greek classics whose works were adapted to the actual condition of the country. The first two volumes contained the complete works of Isocrates. The next six volumes were devoted to Plutarch; and these were followed by Strabo in four volumes. The Strabo of this "Library" contains the best text of that author that has yet been given to the world. During these latter years Coray contributed largely to the columns of the *Logios Hermes* (Scientific Mercury), a Greek journal founded and published at Vienna by Anthimus Gazi. In 1821 the Greek revolution broke out, to the great surprise and even alarm of Coray, who thought the movement premature, and had not looked for it till thirty years later. However, he hailed the dawn of his country's freedom by publishing an edition of Aristotle's *Politics*, and, in the following year, the *Nicomachean Ethics* of the same author. His remaining contributions to the *Bibliotheca Hellenica* were the *Memorabilia* of Xenophon, the *Gorgias* of Plato, and the speech of the orator Lycurgus *Against Leocrates*. Nine less elaborate volumes, which he called *Parerga*, were afterwards added to the *Bibliotheca* by way of supple-

Koräes.

Kordofan. ment. His subsequent works were editions of the first four books of the *Iliad*, of the *Asteia* of Hierocles, and of the *Pastoral Letters of St Paul*, and three volumes of *Atakta*, or Miscellanies. He died at Paris, April 6, 1833, having nearly completed his eighty-fifth year, and having lived long enough to see the independence of his country established and secured on a proper basis.

As a scholar Coray rendered essential service to the literature of ancient Greece, both by giving a powerful impulse to the study of it, and by the large number of happy restorations which he made in the corrupt texts of all the authors edited by him. It has been objected to him, not without reason, that he relied too much on his faculty of critical restoration, and sometimes ignored extant manuscripts of undoubted authenticity. He rendered a no less signal service to the modern Greek, by fixing the rules of orthography and construction. One set of writers, whom he called "the macaronic," with Neophytus Doukas at their head, wished to revive the classic forms. To the great mass of the people their works written on this principle were a sealed book. On the other side, Cathartzi, Christopoulos, and their faction, wrote the modern Greek exactly as it was spoken, and thus prevented it from attaining any literary perfection. Coray took a middle course. He banished all foreign, and especially all Turkish words, and substituted for them words drawn from the literary language, to which he gave modern terminations or forms. The syntax he reconstructed as nearly as possible on the classic model, steering clear of the foreign idioms which had gradually crept in, and avoiding at the same time the affectation of a too severe purism. Time has consolidated Coray's system, and, with some trifling modifications, it is now in general use in Greece.

KORDOFAN, a country of Africa, bounded N. and W. by Nubia and Darfur, E. by Senaar. Mountains and forests to the S. separate it from regions little explored. The general surface is flat, the chief exceptions being in the N. and S., and there is no perennial stream but the Bahr-el-Abiad, which divides it from Senaar. The extremes of temperature are great; the heat in the dry season reaching 122° Fahr. in the shade, while the cold of the nights is severe. During the rainy season, which lasts from April to September, the face of the earth undergoes that rapid and striking change characteristic of tropical countries, the scorched and brown line of the plains gives place to a lively green, and the soil, which seemed hopelessly baked and lifeless, gives forth grass and corn, fruits and flowers. The principal grains cultivated are durrha and sesamum. Among the natural productions, one of the most valuable is the Acacia, producing the finest species of gum-arabic. Among the wild animals are the elephant, rhinoceros, lion, leopard, giraffe, hyæna, antelope, ostrich, &c. The wandering Bedouins rear excellent horses, as well as camels and cows; sheep and goats are bred in great numbers in the hilly country of the south. The inhabitants are chiefly of three races,—negroes, the indigenous race, Arabs so called, and emigrants from Dongola. The last have most of the trade in their hands, and, together with the Arabs, bear no good character for honesty; the aborigines are a simple and hospitable people. The only manufacture carried to any degree of excellence is the tanning of sheepskins. Iron is also wrought to some extent. The most important export is gum-arabic, of which there is a government monopoly, as well as of hides and senna. Cattle, sheepskins, ivory, gold and silver, ostrich eggs and feathers, &c., are also exported. The capital of the country is Obeid, a straggling mud-built place, of about 5000 inhabitants. Kordofan was subdued by Mohammed Ali, viceroy of Egypt, in 1820. It had for some time been subject to Darfur, and previously to Senaar. Before the Egyptian conquest, Obeid is said to have been a place of considerable trade.

KÖRNER, THEODOR, the Tyrtæus of Germany, was born at Dresden in 1791. When a child, he was sickly and feeble, but as he grew up, his whole nature seemed to undergo a complete change. He began to study with intense ardour, devoting himself to history, the physical sciences, and above all to poetry. His father, a man of good station and fortune, enjoyed the personal friendship of Goethe and Schiller. Till his seventeenth year the young Körner had been educated at home. He was then sent to the mining school of Freiberg, and in due time was transferred to the university first of Leipzig, and afterwards of Berlin. In both of these cities he distinguished himself by his enthusiasm for the independence of Germany, and his efforts to rouse his countrymen to throw off the iron yoke of Napoleon. His zeal outran his prudence, and his father judged right to send him for a time to Vienna, where such doctrines might be taught with greater safety. Here he began to write for the theatre. His first two plays, "Die Braut" (*The Bride*), and "Der Grüne Domino" (*The Green Domino*), were completely successful, but were altogether eclipsed by the brilliant triumph of "Rosamonde," "Toni," and above all of "Zriny." When the disastrous issue of Napoleon's Russian campaign restored the prospects of freedom to Germany, Körner volunteered as a private into the Prussian light-horse of Lützow. At the affair of Kitzén, he fought with distinguished valour against the French. Severely wounded in the battle, he crawled during the night into a wood, where he was found next morning by some peasants, who took care of him till he was quite recovered. When he rejoined his corps he was presented with a commission as the reward of his valour. In the constant skirmishes between the French and German troops he exposed his person in the most reckless and daring fashion. At last, on the 26th August 1813, he met the death he had so often seemed to court in vain, being killed by a shot near the village of Wöbbelin in Mecklenburg. He was buried where he fell, at the foot of an oak-tree by the wayside, and his name was carved in the bark. An iron monument now marks the spot.

Körner, at the time of his death, had not completed his twenty-second year, and, in forming an estimate of his poetry, this fact must always be borne in mind. One thought breathes through all his works,—the freedom and independence of the German fatherland, to be wrought out at whatever cost of treasure and blood. Intense hatred to the French, the oppressors of his country, breathes in every line of Körner's lyrics, and these are the poems on which his fame chiefly rests. These lyrics, most of which were written in the camp, were collected into a volume under the title of "Leier und Schwert" (*Lyre and Sword*). The best of them, the "Schwert-lied" (*Song of the Sword*) was written on the field of battle only an hour before he fell. His dramas, though they contain many really powerful scenes, and even some well-drawn characters, are ill-sustained. Many deep thoughts happily expressed, and the general outline of the plots, seem to indicate that, had his life been spared, he might have attained eminence as a dramatist. As it is, his fame will rest mainly on the short pieces which he threw off in the white-heat of a temporary passion.

KOROTSCHA, a town of Russia, government of Kursk, on a small river of its own name, 70 miles S.E. of Kursk. It has a saltpetre manufactory; and carries on a large trade in apples, for which the district is famous. Pop. (1849) 4236.

KOSCIUSKO, THADDEUS, a Polish general, celebrated for his lofty patriotism, was descended of a noble but not opulent family, in the province of Lithuania, and born in 1756. He was educated at Warsaw, and was afterwards sent, at the expense of the state, to finish his studies at Paris. After an absence of several years he returned

Körner
Kosciusko.

home, and became a captain in the Polish army. An unfortunate attachment made it necessary for him to go abroad for a time, and he proceeded to North America, served as adjutant to General Washington in the War of Independence, was decorated with the order of Cincinnatus, and returned to his own country, where he lived in retirement until 1789. About this period he was promoted to the rank of general-major by the Diet, which was then making vain efforts to restrain the influence of foreign powers. Kosciusko was at that time little known; but in 1792 the affair of Dubienka, where with 4000 men he defended for six hours a post attacked by 15,000 Russians, gained him much reputation. He served with equal distinction, during the whole campaign of that year, under the young Poniatowski; but the weakness of Stanislaus rendered fruitless the most generous efforts to maintain the independence of his country. He submitted to the conditions which were imposed upon him by Russia, and under the appearance of a treaty of peace, signed the ruin of Poland. Many of the best officers of the Polish army, Kosciusko in the number, resigned in indignation, and retired to various parts of Germany. When the revolution broke out in Poland in 1794 he was appointed generalissimo of the insurgent patriots, and invested with dictatorial power. Hastily organizing a corps of 5000 men, he marched at their head against the Russians, who were advancing upon Cracow with greatly superior numbers. Destitute of cavalry and artillery, he met the enemy at Wraclawice, and, after a combat of four hours, completely defeated them. This first success produced a general rising; Warsaw was delivered from the presence of the Russians; and Kosciusko soon saw himself at the head of an army of 50,000 men, including about 25,000 regular troops. With this comparatively small force the Polish general-in-chief had to make head at once against the Russians and the Prussians. Frederick William II., who had just failed in his contest with the French, appeared desirous to avenge himself for this affront on the Poles; and, at the beginning of 1794, he marched against Warsaw, at the head of 40,000 men. Kosciusko, who, upon this point, could not oppose to him more than 15,000 men, had nevertheless the courage to attack him at Szezakocin, on the 8th of June 1794; but after a murderous combat, in which he had two horses killed under him, he was obliged to retire to the entrenched camp that covered the capital, where, for two months, he resisted the reiterated assaults of the enemy. At the same time he contrived to keep in order a furious populace, prone to give way to the greatest excesses. Scarcely had he been delivered from the Prussians, in consequence of the diversion which the insurrection of Great Poland operated in his favour, when Kosciusko saw advancing against him the Russian armies under Suaroff and Fersen. It was in vain that he attempted to prevent the junction of these two armies. On the 4th of October, being attacked at Macijowice by very superior forces, he held his ground during the whole day; but at length he sank down pierced with wounds, exclaiming, as he fell, *Finis Poloniae*. As soon as he was sufficiently recovered, he was sent to St Petersburg, where he remained a prisoner of state for two years, and was only liberated on the accession of the Emperor Paul. He immediately set out for England, and thence for America, where he passed several years amongst his old companions in arms. In 1798 he returned to France, where he was received with much distinction, and learned that a great number of his countrymen had enlisted under the banners of the new republic. Those who served in the army of Italy sent him the sabre of John Sobieski, which had been found in the Casa di Loreto. From this time he lived either at Paris or at a country-house which he had purchased near Fontainebleau. When Napoleon was about to invade Poland in 1807, he wished to avail himself of the name of Kosciusko, in the hope of thereby inducing the people of that country to

revolt against the Russians. But the Polish general had too much knowledge and experience not to divine the object for which recourse had been had to him, and positively refused. The address, signed with his name, which appeared in the *Moniteur* in 1806, was a forgery, and was everywhere accepted as such, though it was not till eight years later that Kosciusko was able to give it a public and formal denial. When the Russians penetrated into Champagne in 1814, they learned with surprise that their ancient enemy was living peaceably there. All those who had an opportunity of visiting his retreat testified their regard for him in the strongest manner; and the Emperor Alexander himself had a long interview with the veteran patriot. Nothing could induce Kosciusko to return to his native country. In 1815 he made a tour in Italy, and afterwards established himself at Soleure in Switzerland, where he devoted himself chiefly to agricultural pursuits. His death, which took place on the 16th of October 1817, was occasioned immediately by an accidental fall from his horse. On the news of his demise, the whole of Europe resounded with his praises; amongst all nations, and in every country, justice was equally rendered to the brave soldier and the true patriot, who, without any other object than the independence and welfare of his country, had exposed himself to the greatest perils, and the most painful sacrifices. His remains were interred in the cathedral at Cracow, between those of John Sobieski and of Joseph Poniatowski. See POLAND. (J. B.—E.)

KÖSFELD, KOESFELD, or COESFELD, a town of Prussia, capital of a cognominal circle in the government of Munster, on the Berkel, 20 miles W. of Munster. It is surrounded by old walls, and has a castle, with some manufactures of linen and woollen goods. Pop. (1849) 3607.

KÖSLIN, or COSLIN, a town of Prussia, capital of a cognominal government in the province of Pomerania, on the Niesenbecke, about 4 miles from its mouth, in the Jamund lagoon, which communicates with the Baltic. The town was rebuilt on a regular plan, after its destruction by fire in 1718, by Frederick William I., to whom a statue has been erected by the citizens in the market-place. Köslin is the seat of the superior courts of the government, and has a gymnasium, normal school, a society for the promotion of agriculture, &c. Chief manufactures, linens, woollens, hosiery, and leather. On the Gollenberg, a little to the E. of the town, is a monument to those Pomeranians who fell in the campaigns of 1813–15. Pop. (1849) 8813.

KOSTER, LAURENZ, for whom some claim the invention of printing. See PRINTING.

KOSTROMA, a government of European Russia, lying between N. Lat. 57. and 59., and E. Long. 40. and 48.; and bounded on the N. by the government of Vologda, W. by Jaraslavl, S. by Vladimir and Nijegorod, and E. by Viatka. Area 31,378 square miles. The surface is in general flat, but the soil is not very fertile, being in the N. marshy, while in the S. it is clayey and sandy. The principal rivers are the Volga, and its affluents the Unsha and Vetluga. The climate is severe, but not unhealthy; winter is long and severe, while summer is short and frequently misty. The principal grain crop is rye, but the quantity grown is not equal to the consumption. Large quantities of flax and hemp are produced. The forests are extensive and valuable, principally the property of the crown. The rearing of cattle is little attended to; but the fisheries in the lakes and rivers are actively carried on. Various manufactures are also actively prosecuted in the government, particularly of linen and woollen goods, Russia leather, and brandy. Pop. (1851) 1,020,628.

KOSTROMA, the capital of the above government, is situated at the confluence of the Kostroma and Volga, 228 miles N.E. from Moscow. A wall of earth which surrounded the town has been converted into a promenade. The cathedral is a very handsome building. There is a large bell

Košzegh foundry, several tanneries and manufactures of linens, soap, tallow, &c. Pop. (1854) 13,490.

KÖSZEGH, or GÜNS, a town of Hungary, situated on the slope of a valley, 57 miles S.E. of Vienna. It has an old castle, several upper schools, considerable woollen manufactures, and extensive trade in wine and fruits. It held out nobly in 1532 against the besieging army of the great Suliman. Pop. 8000.

KOTA, in Hindustan, a raj, or native state of Rajpootana, situated between Lat. 24. 30. and 25. 50., Long. 75. 35., and 76. 56. Its area may be estimated at 4339 square miles. The later history of this petty state is somewhat extraordinary. About the year 1771, on the death of a rajah named Goman Singh, the entire powers of the government passed into the hands of a chieftain named Zalim Singh, in the character of regent; the departed rajah having nominated him to this office during the minority of the heir, Omed Singh, then only ten years of age. In 1817 a treaty was concluded between the British government and the state of Kotah, which confirmed the succession to the principality to the son of Omed Singh, but vested the entire administration of affairs in Zalim Singh, by whom it had been so long exercised, and after him in his eldest son, Madhoo Singh and his heirs. It was thus proposed to perpetuate the extraordinary state of things which had accidentally arisen out of the commanding talents of Zalim Singh and the supine indifference of Omed Singh. The results which might have been anticipated followed. The rajah Omed Singh died in 1819, and the dissatisfaction of his successor soon became apparent. In 1824 Salim Singh died. His son Madhoo seems to have inherited no portion of the abilities of his father; and the incongruity of a titular prince, and a servant invested with sovereign power, was now rendered more glaring by the fact, that the latter was an incompetent administrator. To get rid of a system so anomalous, unpopular, and inconvenient, it was proposed by the British government that Madhoo Singh should resign his pretensions to the administration, and receive in compensation part of the territory to be formed into a new principality, and held by him independent of the rajah of Kota. The proposal was at first objected to. At a later period, however, it was revived, and the difficulties in the way of carrying it out surmounted. The more southern part of Kota was assigned to the descendant of Zalim Singh as a separate principality, and the remainder was allotted to the representative of the ancient rajahs of Kota. Kota, the capital of the territory of the same name, is in Lat 25. 10., Long. 75. 52.

KÖTHEN, or CÖTHEN, a town of Germany, capital of the duchy of Anhalt-Köthen, on the Ziehe, and on the Berlin-Bernburg, and Magdeburg-Leipzig railways, 40 miles N.E. of Leipzig. It consists of an old and new town, and is well and regularly built. Among its public buildings are the old ducal palace, where the states hold their sittings, and which has a small collection of pictures, a collection of coins, and a good library; the new ducal palace; the prince's palace; a Lutheran, a Reformed, and a Roman Catholic church, and a Jewish synagogue. It has an institution for noble ladies, founded by Princess Gisela Agnes in 1711, a high school, normal school, and theatre. There are manufactures of linen and woollen stuffs, and some trade in corn and wool. Pop. 6200.

KOTTBUS, a town in the Prussian province of Brandenburg, and government of Frankfort, on the Spree, 42 miles S. by W. of Frankfort. It consists of a walled town and several suburbs, and has an old castle with 4 towers, 4 churches, a gymnasium, orphan asylum, 2 hospitals, and a public library. Manufactures of linen and woollen stuffs, leather, beer, brandy, and paper. It is the capital of a cognominal circle, and the seat of various courts. Pop. (1849) 8978.

KOTZEBUE, AUGUSTUS FRIEDRICH FERDINAND VON Kotzebue. a prolific German dramatist and miscellaneous writer, was born on the 3d of May 1761, at Weimar, where his father was a counsellor of legation. He early evinced a propensity to poetry, and, whilst yet a boy, the representation of a play which he witnessed inspired in him such a love of the drama as determined his future destiny. He received the rudiments of his education at his native place, and when he was about sixteen years of age he entered the University of Jena. Here he remained for one year; but certain family circumstances occurred which induced him to remove to Duisburg, where he studied for a short time at the university, and returned to Jena in the year 1779. He was destined for the profession of the law, but the master-passion predominated; and in gratifying his love of the drama, as well as of literature in general, he consumed no inconsiderable portion of his time. If at this period he did not display great talent, he at least evinced wonderful versatility. Tragedy, comedy, ballads, essays, and other species of literary composition, flowed rapidly from his prolific pen. Their merits, however, he himself confesses in his autobiography, were exceedingly equivocal, although some of his plays were acted with applause. In his nineteenth year, he closed his studies at Jena by taking the character of an opponent at a doctor's degree. Soon afterwards he returned to his native place, where he diligently applied himself to the Pandects, and was admitted as advocate. But his addresses to the muses were still as assiduously paid as ever; and in the ardour of his desire for distinction he tried his skill in almost every species of composition, imitating, as caprice or admiration predominated, all the great writers of Germany, Schiller, Goethe, Wieland, Hermes, and others.

In 1781, on the invitation, it is said, of the Prussian ambassador, Kotzebue went to St Petersburg, where he obtained a situation under Von Bawr, general of engineers. The latter became his warm friend, and recommended him to the empress, who, on the death of Bawr, which occurred about two years afterwards, nominated him a counsellor. His imperial patroness first placed him in a judicial situation at Revel, and finally appointed him president of Esthonia, on which occasion he was ennobled. His literary ambition kept pace with his growing fortunes, and drama succeeded drama from his pen, with great, if not increasing, rapidity. In 1790, on a journey to Pymont, he published his *Doctor Bahrdt with the Iron Forehead*, under the name of *Knigge*; a work which created a considerable sensation at the time of its appearance, but by which he lowered himself not a little in public estimation. Dismissed from the imperial service, he retired for a time to an estate which he possessed at some distance from Narva; but, in 1797, he returned to Weimar, with a pension of 1000 guilders. Three years afterwards, he was induced to pay a short visit to Russia; but he had scarcely crossed the frontiers of the empire when he was arrested by order of Paul I. and sent to Siberia. This treatment of Kotzebue is said to have originated in a suspicion of the autocrat that he was the author of some political pamphlets, in which the emperor was personally attacked; but the exile was kept entirely ignorant of the cause of his banishment. He was, however, shortly afterwards recalled, and, as he informs us himself, well received by the emperor, who confided to his direction the theatre of St Petersburg.

After the death of Paul I. Kotzebue returned to Weimar, and in 1802 was admitted a member of the Academy of Sciences at Berlin. Some disputes which he had with Goethe and the Schlegels induced him to remove to Paris, where the French literati flattered his love of adulation by the attentions which they paid him. It is not much to his credit that he repaid their kindness by the publication of a calumnious work entitled *My Recollections of Paris*.

Kotzebue.

The Italians were treated in the same spirit of illiberality in his *Recollections of Rome and Naples*. About the end of 1803 he commenced, in conjunction with Merakel, a journal entitled *Der Freymüthige*, "The Free-hearted," in which Napoleon was virulently attacked. In 1806 he went again to Russia, and lived from 1807 on his estate in Esthonia, never ceasing to write against the imperial usurper of France. Literature and politics continued to engage the pen of Kotzebue until 1813, when, as counsellor of state, he followed the Russian head-quarters during the campaign of that year; and, in order more effectually to excite the nations against Napoleon, he published in Berlin the Russian-German National Gazette (*Volksblatt*). After the affairs of Europe were decided by the victory of Waterloo, he went to St Petersburg; but was, in 1817, commissioned by the Emperor Alexander to return to his own country, and to report upon the state of literature and public opinion, for which he was to receive a salary of 15,000 roubles. He who had exerted himself so much in favour of Russia, sometimes, it is affirmed, at the expense of his native country, was not likely to be warmly welcomed on his return home. From the first he was looked upon as a spy; and the zeal which he displayed in his new employment soon confirmed this opinion, and prepared the way for his destruction. He established a literary weekly paper, in which judgment was passed on the publications of the day, and political opinions advanced at once dishonourable and obnoxious to Germany, then awakening from its torpor, and heated with the expectation of concessions on the part of its rulers, and by delusive anticipations of representative systems. In his journal Kotzebue steadily ridiculed every attempt to form liberal institutions; and not only was every species of political amelioration opposed, but a marked enmity to the liberty of the press was exhibited. A private communication of his to the Emperor of Russia, which had been obtained it matters not how, was published in a German paper, and republished throughout the country; and its appearance excited a strong feeling of hostility and indignation against the author. Shielded as he was by the power of the autocrat, he found it necessary to quit Weimar for Mannheim, where his literary and diplomatic labours were resumed with increased activity. Unfortunately for him, he began to point his pen more directly against the wild dreams of liberty which were seething in the minds of the great mass of the students at the German universities. A spark of dangerous enthusiasm caught the heated brain of a young fanatic named Sand, who thought that he had done a deed of heroic virtue when, on the 23d March 1819, he deliberately murdered the advocate of tyranny and despotism. The murderer immediately gave himself up to justice, and suffered on the scaffold. Kotzebue, though the contemporary of Goethe and Schiller, was the most popular German author of his day. His fame was gained by his dramas, amounting to about a hundred in number. The best of them are "Die Indianer in England" (*The Indians in England*); "Menschenhass und Reue" (*Misanthropy and Repentance*), which, under the name of "The Stranger," still keeps the stage in this country; "Die beiden Klingsberg" (*The two Klingsbergs*), which has not yet been translated into English, but which Goethe pronounced the best of all Kotzebue's plays; "Der Strassenräuber aus Kindersliebe," else known as *Lovers' Vows*; "Die Spanier in Peru," adapted by Sheridan into English, under the title of *Pizzaro*, and still a stock-piece in the theatres; "Benyowski;" and the "Virgin of the Sun." These plays are of very different degrees of merit; but it may be said that, except perhaps "The two Klingsbergs," not one of them has any permanent value. Kotzebue was in truth not so much a dramatist as a playwright. His great object was to startle his audience. The machinery he employed was pathos worked up to a harrowing pitch of

tenderness, sentiment carried to the extreme of maudlin, and bursts of passion, which even the votaries of the "littérature extravagante" of France would disclaim as overdone. The freshness, or at least the strangeness of his plays, raised him at once to the height of popularity. He dazzled there like a meteor, and for as short a time; and then vanished into the darkness. Kotzebue attempted history, and wrote an extremely bad *History of the German Empire*, and an equally bad *Early History of Prussia*. At the time of his assassination he was in his fifty-ninth year. He had been three times married, and left behind him thirteen children. One of these children, Otto Von Kotzebue, became a captain in the Russian navy, and published an account of a voyage which he made round the world in 1824-26.

KOULI KHAN. See NADIR SHAH.

KOURLAND, KURLAND, or COURLAND, one of the Baltic provinces of Russia, lying between N. Lat. 56. 57. 30., and E. Long. 21. 27., and bounded on the N. by Livonia and the Gulf of Riga, W. by the Baltic, S. by Wilna and Prussia, and E. by Vitebsk; area 10,324 square miles. Along the coasts the surface is flat, with numerous marshes and sandy heaths, but in the interior it is generally undulating. A range of hills runs parallel with the Duna, and sends off ramifications in various directions over the country. The elevations nowhere exceed 500 ft. in height. The principal river is the Duna, which flows along its E. and part of its N. boundary; the principal of the others are the Aa and Vindau. There are numerous lakes and marshes, which render the climate damp and foggy. About two-fifths of the surface is covered with forests, chiefly of pine, fir, birch, alder, oak, and elm. The soil is light and sandy, requiring much manure to render it productive. It is most fertile towards Livonia. The principal occupation of the inhabitants is agriculture, which is in a higher state of perfection here than in any of the neighbouring provinces. Rye, barley, and oats, are the principal grain crops; flax and hemp are also extensively cultivated, and some tobacco is raised. The rearing of cattle is little attended to, and the breeds are inferior. The manufactures are insignificant, with, perhaps, the exception of brandy. The exports, which are considerable, are chiefly corn, flax, hemp, salted meat, and skins. Kourland belonged to Poland till 1795, when it came into the possession of Russia. The inhabitants still enjoy many of their own peculiar rights. Pop. (1851) 539,270).

KOURSCK, a government of European Russia, N., W., S., and E., by Orlov, Tchernigov, Poltawa, Kharkov, and Voronej. Its greatest length, E. and W., is 170 miles, breadth 150; area 17,318 square miles. Pop. (1851) 1,665,215. The general surface is undulating, there is comparatively little wood, and the only considerable rivers are the Sem, a tributary of the Desna, flowing to the W.; and the Donetz, which rises in the S. of the province. The soil is singularly rich, needing no manure; the climate mild, and so dry, that corn is never housed, the grain itself being heaped in pits underground. The agriculture is very primitive; and though the breed of horses is good, oxen alone are employed in the fields. Among the chief crops are wheat, barley, rye, oats, millet, pease, flax, hemp, and tobacco; garden fruits and vegetables are grown in great abundance. The principal minerals are iron, limestone, and saltpetre: fuel is very scarce. Koursk is one of the most populous, as well as fertile provinces of Russia; of the towns besides the capital, the largest are Bielgorod, Karotcha, Putiwl, and Soudja; the face of the country is thickly strewn with villages. With small exception, the universal employment is husbandry: cattle, sheep, and swine, are bred in great numbers, as also are bees.

Koursk, the capital of the government, is built on a tributary of the Sem, 500 miles S. of Moscow. It is a large

Kouli Khan
||
Koursk.

Kozloos place, with narrow and dirty streets, and no remarkable buildings. It is the residence of the civil and military governors, and of the Archbishop of Koursk and Bielgorod, and has a considerable trade with St Petersburg and Moscow, exporting cattle, leather, tallow, wax, honey, &c. Pop. (1849) 30,469. A great annual fair is held at a village in the neighbourhood.

KOZLOOS, or **EUPATORIA**. See **CRIMEA**.

KRAIN, or **CARNIOLA**. See **AUSTRIA**.

KRANTZ, **ALBERT**, a celebrated German chronicler, was born at Hamburg about the middle of the fifteenth century. Having finished his studies, he travelled through Western and Southern Europe; and returning to Germany, he graduated at Rostock, and finally became rector of the university of that city. Being recalled to Hamburg, he was provided with a canonry in the cathedral, and divided his time between preaching and teaching theology. Elected syndic of Hamburg in 1489, he took part in the assembly of Wismar, where the interests of the Hanseatic towns were discussed. He was deputed to proceed to France in 1497 to conclude a treaty, and to England in 1499 to solicit assistance against the pirates who then infested the North Sea. In these different missions he evinced so much prudence, sagacity, and integrity, that John King of Denmark, and Frederick Duke of Holstein, chose him, in 1500, to terminate the dispute which had arisen between them on the subject of the province of Ditmarsen. Krantz, having been named dean of his chapter in 1508, laboured with great zeal to remedy the disorders which had been introduced into ecclesiastical discipline; but it is only by a forced interpretation of some passages in his works that Wolf, and after him Bayle, have endeavoured to make him be considered as one of the precursors of Luther. Krantz was witness to the first attacks of that reformer upon the Church of Rome, and warmly condemned them. He died Dec. 7, 1517. Krantz was a very learned man; and the historical works which he left behind him are useful, notwithstanding the errors by which they are disfigured. Some critics have accused him of plagiarism and of bad faith; but he has found numerous apologists, amongst whom may be mentioned Cisner, who places him in the first rank among the writers of his age for truthfulness, as well as elegance of style and clearness of method. His principal works are, his *Chronica Regnorum Aquilonarium, Daniæ, Sueciæ, Norragiæ*, Strasburg, 1546, in folio; *Saxonia, sive de Saxoniciæ Gentis vetusta origine, longinquis expeditionibus susceptis, &c., libri xii.*, Cologne, 1520, in folio; *Vandalia, sive Historia de Vandalorum vera origine, variis gentibus, crebris e patria migrationibus, &c.*, Cologne, 1519, in folio; *Metropolis, sive Historia Ecclesiastica Saxoniciæ*, Basil, 1548, in folio; and some other works of little importance. (J. B—E.)

KRASNOE, a Russian village, 30 miles S.W. of Smolensk, near which the French, in the retreat of 1812, lost, during three successive days, 25,000 men, several thousand prisoners, and twenty-five pieces of cannon.

KRASNOE-SELO, a small town of Russia, 18 miles S.S.E. of St Petersburg. There is an imperial palace here, and in summer troops from the capital are often encamped in the neighbourhood.

KRASNOE-YARSK, a town of Siberia, capital of the government of Yenisei, on the river of that name, 290 miles E.S.E. of Tomsk. It is situated in the midst of a very fertile district, and has a considerable trade in agricultural produce and Chinese goods. There is a large leather and coach manufactory, in which convicts are employed. Pop. 6472.

KREMENTSCHUK ("The City of Fire-stones"), a town of Russia, government of Poltava, on the Dnieper, 70 miles S.W. of Poltava. It has a considerable trade, and manufactures of sugar, liqueurs, soap, saltpetre, &c. Pop. 17,074.

KREMnitz, a royal mining-town of Hungary, county

of Bacs, 88 miles E.N.E. of Presburg. It is situated in a deep and gloomy valley, and contains an old fort, a mint and mining directory, a gymnasium and other schools, with some manufactures of vitriol, paper, earthenware, and vermilion. To the mint of Kremnitz properly belongs the coinage of all the gold and silver of Hungary. The neighbouring mines yield annually about 180 lbs. troy of gold, and 11,000 lbs. of silver, besides copper, lead, and cobalt. The richest veins, which are now nearly exhausted, belong to private companies. Pop. about 6000.

KREMS, a town of Lower Austria, in a picturesque valley at the confluence of the Krems with the Danube, 37 miles W.N.W. of Vienna. It has a Piarist convent, gymnasium, theatre, &c., and manufactures of mustard and gunpowder. Pop. 6537.

KREUTH, a small but fashionable watering-place of Bavaria, about 40 miles S. of Munich. Its situation is highly romantic, at an elevation of 3000 feet, hemmed in by mountains wooded to the summit. The waters are sulphureous; goats' whey and an infusion of mountain herbs are also much used medicinally.

KREUZNACH, a town of Rhenish Prussia, on the Nahe, 40 miles S.S.E. of Coblenz. It is picturesquely situated in a fertile district, irregularly built, with many old houses; and has manufactures of woollens, leather, tobacco, soap, &c. In the neighbourhood are extensive salt-works, and the saline springs attract a considerable number of visitors. Pop. (1846) 9383. This place was stormed by Gustavus Adolphus in 1632.

KRONSTADT. See **CRONSTADT**.

KROTOSZYN, a town of Prussia, province of Posen, on the Silesian frontier, 55 miles S.E. of Posen. Pop. (1846) 8049, employed in manufactures of woollen and linen, leather, tobacco, brandy, &c.

KRUMHORN, an old musical instrument of the cornet kind. Organ-builders, corrupting the name into *Cremona*, have wrongly applied this to one of their reed-pipe registers.

KUBAN, or **KOUBA**, a river of Russia. See **CAUCASUS**.

KULM, a village of Bohemia, at the foot of the Nollendorf Pass in the Erzgebirge, about 2 miles N. of Töpliz. An obstinate and decisive battle was fought here, August 30, 1813, between the French under Vandamme and the allied forces under Count Colloredo Mansfeld, ending in the utter rout of the former. Three monuments commemorate the victory.

KUR (the ancient *Cyrus*), the principal river of Georgia, Western Asia, rises in a branch of the Caucasian Mountains, a little to the N.W. of Kars, about N. Lat. 41., E. Long. 42. 30. It has a northerly course through the Turkish dominions, and to within about 60 miles of Tiflis, when it turns suddenly in a S.E. direction, and, after passing that city, empties itself by several mouths into the Caspian. It receives the waters of the Araxes about 70 miles from its mouth, and becomes navigable for small vessels. Its length is estimated at about 520 miles.

KURDISTAN, or **KOORDISTAN**, an extensive tract of country in Western Asia, belonging partly to Persia and partly to Turkey, and comprising a large part of the high table-land which stretches southwards from Armenia to the basin of the Tigris. The name signifies the "Land of the Kurds or Koords;" and as that people have spread on all sides from the original cradle of their race, the name is often loosely applied to a greater extent of country than is strictly correct. Kurdistan proper lies between N. Lat. 34. and 39., and E. Long. 42. and 47. Its area may be computed at between 40,000 and 50,000 square miles. The northern and southern portions of Kurdistan present completely distinct geographical features. The first is almost wholly occupied by mountain ranges running nearly parallel from N.W. to S.E. The Soli chain stretching from

Krems
Kurdistan.

Kurdistan.

the city of Jezireh, near the Tigris, right across the country to the Persian frontier. It is low at first, not rising higher than 1000 feet. In the middle of its course, where it takes the name of El Khair, it reaches the height of 3000 feet, and continues to rise till it reaches the confines of Persia. Between this ridge and the Armenian frontier is the lofty plateau of Ali-Bagh, varying from 4000 to 7000 feet in height, and intersected at rare intervals with valleys. During the scorching heats of summer the shepherds drive their flocks from the low grounds to this table-land, which affords a scanty pasturage. Between the El Khair Mountains and the Persian boundary the mountains rise higher, and the valleys, though still very narrow, become deeper. Some of the peaks attain a great height; the highest, Jawar-Tagh, is said to be nearly 13,000 feet above the sea. The southern portion of Khurdistan possesses large tracts of low and level lands. Three ranges of low hills diversify the surface, but only on the side of Persia can it be considered mountainous. These ranges are Kara-Tagh on the N.E.; Ali Tagh in the centre; and the Hamrin Hills on the S.W. The principal rivers in Khurdistan are the Zab-Ala or Great Zab, the Zab-Asfal or Lesser Zab, and the Diyalah. The first of these, rising in the Ali-Bagh, drains a great part of Northern Khurdistan, and, flowing past the Kara-Tagh, falls into the Tigris, a little way below Mosul. The Zab-Asfal rises on the borders of Southern Khurdistan and Persia, and, flowing in a course nearly parallel with the Great Zab, joins the Tigris about 50 miles further down. The Diyalah falls into the Tigris about 30 miles above Baghdad.

The climate of Khurdistan ranges between the extremes of heat and cold. In summer the heat is intense, especially in the S. In winter, the cold in Northern Kurdistan is quite unendurable. On many of the mountain-tops snow remains for six months of the year. The plains produce in abundance the ordinary cereals and vegetables of Europe; and the finest fruits grow in profusion in the orchards. Melons, cucumbers, and other gourds, in especial attain an immense size. In the low grounds near the Tigris, tobacco, cotton, rice, and millet are raised in large quantities, chiefly for exportation. The sides of the lower mountains are covered with forests of oak, walnut, and other hardwood trees. Immense quantities of gall-nuts are gathered, and form a valuable article of commerce. Another important article is the manna found in large quantities on the leaves of the dwarf oak, tamarisk, and other shrubs. Bears, wild boars, goats, and deer abound in the forests, but birds, except partridges and quails, are scarce. Bees are numerous, and their honey is eagerly sought after for purposes of trade. Of domestic animals the horse is the most valuable. It is used solely for riding, and is in great request for the Turkish and Persian cavalry. The ox is the chief beast of burden, a very few camels only being used. The sheep are very numerous, and their fleeces yield wool of very fine quality. Minerals are scarce. Some iron and sulphur are found in Northern Kurdistan, and there are numerous salt-springs in the S. Naphtha and petroleum are also abundant. Korkuk in Northern Kurdistan is the chief centre of commerce, which is carried on mainly with Baghdad and Persia by means of caravans.

The Kurds were known to the ancients under the name of Carduchi. (See CARDUCHI.) They were originally subject to the Persians; but after the era of Alexander were incorporated with Syria. In the third century B.C. they were dissevered from that kingdom by the Parthians, and, on the destruction of the new Persian kingdom, passed to the caliphate of Baghdad. In 1258 Kurdistan was conquered by the Moguls, and, 130 years later, by the Tartars, under Tamerlane. In the beginning of the sixth century Kurdistan once more became subject to Persia. They continued faithful to their new masters for about a century, but

being oppressed by them, revolted and attached themselves to the Turkish sultans. At the present day about three-fourths of the country are subject to the Porte, and are comprised within the eyalets of Baghdad, Mosul, and Van. The remaining fourth belongs to Persia, and forms the province of Kurdistan, of which the capital is Kermanshah. The number of Kurds in Kurdistan and the adjoining countries is estimated at from 2,000,000 to 2,500,000. Most of them are Mohammedans; but a good many Nestorian Christians are found among them.

KURILE ISLANDS, a chain of islands in the Pacific Ocean, extending from the Kamtschatka southward to the larger islands that form the Japanese empire. They are twenty-five in number, and are claimed by Russia, with the exception of the three southernmost, which belong to Japan. They are all of volcanic origin, and contain a number of active volcanoes. The surface is very irregular, some of the elevations rising to the height of nearly 6000 feet. The coasts are abrupt and difficult of access, and the seas are subject to violent and sudden tempests. The climate is severe and foggy. Agriculture is not attended to, except on those islands which belong to Japan. The inhabitants employ themselves in fishing and the chase, the produce of which they dispose of to American, Dutch, Russian, and Japanese traders. Area estimated at about 3000 square miles.

KURNUL, in Hindustan, a British district in the Presidency of Madras, bounded on the N. by the River Kistnah, on the E. and S. by Cuddapah, and on the W. by Bellary, containing an area of 2643 square miles, with a population of 273,190. Towards the close of the year 1838, while the British were planning the expedition for the restoration of Shah Shujah to the throne of Cabul, information reached them that military preparations upon an extensive scale had been carried on for some time by the Nawaub of Kurnul. An investigation followed, the result of which left no doubt that the Nawaub was one of the originators of a wide-spread Mussulman conspiracy for the subversion of British rule in India; its development merely awaiting a fitting opportunity, which it was anticipated events in the N.W. would afford. Recourse to arms became necessary. No difficulty was experienced in obtaining possession of the capital, but the Nawaub, with several of his followers, withdrew from the place. A force was despatched in pursuit, which, after a sharp encounter, succeeded in securing the person of the Nawaub, as well as several other prisoners. An immense quantity of warlike stores was found in the town. No satisfactory explanation could be given for the accumulation of so vast a quantity of the *matériel* of war, or for the systematic disguise and concealment under which it had taken place; and as the obvious conclusion was, that the Nawaub's proceedings were connected with plans for the subversion of the paramount power, it was justly thought that the chief had been guilty of a breach of allegiance, and his territory was annexed to the British dominions. The Nawaub was shortly after assassinated by one of his Mohammedan followers.

KURRACHEE, in Hindustan, is a sea-port of Sind, situate on the western coast of that country. At the entrance of the harbour is a bar, having one fathom and a quarter of water when the tide is out, and consequently cannot be safely crossed by ships the draught of which exceeds 16 feet. It is stated, however, that from the beginning of September to the end of May vessels of 800 tons can always enter the harbour at high water, while the roads outside the bar are perfectly safe during the same period for vessels of any size. The town is distant 3 miles from the landing-place when the tide is out, but it has been rendered easy of access by the formation of a mole and road. In 1853 the town and suburbs contained a popula-

Kurile
Islands

Kurrachee.

Kussier
||
Küster.

tion of 22,000 souls. Kurrachee is the safest port of India. In a commercial point of view, it has been defined the gate of Central Asia, and is likely to become to India what Liverpool is to England. This town is about to be connected with the River Indus, probably at or near Hyderabad, by means of the Sindé Railway, and with Europe, by means of the electric telegraph and the Euphrates Valley Railway. Lat. 24. 51., Long. 67. 2.

KUSSIÉ, a Turkish musical instrument, consisting of five strings, stretched over a skin that covers a kind of basin.

KUSTENDJI, or KOSTENDJE (the ancient *Constantiana*), a fortified sea-port town of European Turkey, Bulgaria, on the Black Sea, at the E. extremity of Trajan's Wall, 40 miles E. of Kassova. It has some trade in corn, but the harbour is exposed, and not suited for large vessels. Pop. about 5000.

KÜSTER, LUDOLF, one of the best scholars and most learned men of his age, was born in 1670 at Blomberg in Westphalia. After studying at Berlin, he became, while still a very young man, tutor to the sons of the Count Von Schwerin, prime-minister of Prussia, and afterwards travelled through England, France, and Holland. In all these countries he formed friendships among the most eminent scholars of the day. As an author he first became known in 1696 by his *Historia Critica Homeri*, which was reprinted in 1785 by Wolff in his History of Homer and his Writings. Settling at Utrecht for a few years, he read lectures there publicly, and contributed to Gronovius' *Thesaurus of Greek Antiquity*, and to Grævius' *Thesaurus of Roman Antiquities*. He also set on foot a Latin periodical, under the title of *Bibliotheca Librorum Novorum Collecta a L. Neocoro*. Neocorus was the Greek equivalent for Küster, which means *sexton*, and had been given to him playfully by Grævius, in accordance with a practice common in that age. In 1700 he passed over to England, intent on bringing out a new edition of *Suidas*. In five years he had completed his task, which appeared at Cambridge in 1705 in 3 vols. folio. This work gave him a high rank among critical scholars, and he worthily maintained it by his edition of Iamblichus' *Life of Pythagoras*, Amsterdam, 1707, and, above all, by his splendid edition of *Aristophanes*, published in the same town in 1710. During his residence in that city, his *Suidas* was reviewed in a very ill-natured spirit by his old friend Gronovius. Küster replied in his *Diatrise Anti-Gronoviana*, and silenced his critic, whose remarks had been dictated chiefly by a spirit of splenetic jealousy. To his *Diatrise* he appended a learned essay on the "æs grave" of the Romans; and another, no less learned, on the verb "cerno," which he gave out as a specimen of new *Thesaurus* of the Latin tongue on which he had been engaged for some years. These dissertations involved him in an obstinate controversy with Perizonius, which, to the surprise of all, was carried on with perfect gentleness and moderation on both sides. Removing to Paris in 1713, Küster became a member of the Academy of Inscriptions, and received from Louis XIV. a pension of 2000 livres. Unfortunately he did not live long to enjoy his new honours, as he died in Paris in 1716. Though he was an admirable Latin scholar, it was

Küstrin
||
Куyp.

chiefly as a Hellenist that Küster was conspicuous among the great scholars of his age. Greek was his favourite study, and he attained a mastery over that tongue such as was equalled by few, if any, of his contemporaries.

KÜSTRIN, a fortified town of Prussia, province of Brandenburg, at the junction of the Wartha with the Oder, which is here crossed by a bridge 875 feet in length, 16 miles N. of Frankfort. The town is surrounded by lakes and marshes, which greatly add to its strength. It contains a castle in which Frederick the Great was confined by his father. The manufactures comprised woollens, hosiery, leather, starch, brandy, and bear. Küstrin was taken by the French in 1806. Pop. (1849) 8310.

KUTAHIAH, or KUTAYA (the ancient *Cotycæum*), a town of Asiatic Turkey, pashalic of Anatolia, at the foot of the Pursak Mountains, and on the river of that name, 180 miles N.E. of Smyrna. N. Lat. 39. 25., E. Long. 29. 45. The town is large and populous, and has numerous mosques, public baths, fountains, and khans. On a projecting point of a hill, rising above the town, is an ancient castle. The surrounding country is well watered and fertile, producing grain, cotton, gall-nuts, and fruits, which, with wool and goats' hair are important articles of trade. Kuthiah is noted as the centre of that tract where the famous Turkey carpets are manufactured.

KUTTENBERG, a mining-town of Bohemia, circle of Czeaslau, 38 miles E.S.E. of Prague, on the railway between that city and Vienna. The inhabitants are chiefly dependent on the mines, which have been long worked, and yield silver, copper, lead, arsenic, and zinc, but are much less productive than formerly. Some cotton and woollen stuffs are manufactured, and starch is made. The parish church is a fine Gothic edifice. Pop. (including suburbs) about 10,000.

KUYP, or CUYP, ALBERT, one of the best landscape painters of the Dutch school, was born at Dort in 1606. Of his personal history nothing else, not even the date of his death, is known. His father, Jacob Gerutze Kuyp, was himself a distinguished painter; and though Albert Kuyp adopted a very different manner, and attempted a wider range of subject, it was in his father's studio that he received his art training. For a very long time he was extremely ill-appreciated in his own country, and was scarcely known abroad even by name. England was the first country to discover and rightly value his merits, which are now universally acknowledged. The numerous specimens of his art in all the leading English galleries, private as well as public, show how great a favourite he is in that country. According to Waagen: "In loftiness of conception, knowledge of aerial perspective, with the greatest glow and warmth of the serene atmosphere, Kuyp stands unrivalled, and may justly be called the Dutch Claude. In the impasto, the breadth and freedom of execution, he greatly resembles Rembrandt." It is no doubt on his landscapes that Kuyp's fame chiefly rests, yet his cattle groups and (though perhaps in a less degree) his sea pieces, are in their several ways equally excellent. Dr Waagen, in his *Art-Treasures of Great Britain*, criticizes specially the numerous masterpieces of Kuyp which he found in the various public and private collections.

L.

L
||
Labadie.

L, A semi-vowel or liquid, forming the twelfth letter of the alphabet. It is derived from the old Hebrew lamed, or Greek lambda. In the ancient Greek, the Celtic, and the Etruscan alphabets, the letter is formed by two straight lines making an angle with each other, but sometimes placed horizontally, and sometimes vertically. The Brazilian and Japanese alphabets are said not to possess the letter at all. It is sounded by intercepting the breath between the tip of the tongue and the fore part of the palate, with the mouth open, and makes a sweet sound, with something of an aspiration; hence the Britons and Spaniards usually doubled it, or added an *h* to it, in the beginning of words, as in *llan*, or *llhan*, a temple, sounding nearly like *fl*. Amongst the Ionians the letters *r* and *l* were frequently interchanged. The Romans often put *l* for *r* in words taken from the Greek, as the Italians have done in words taken from the Latins, *e. g.*,—*balathro* from *barathron*, and *pelegrino* from *peregrinus*. In the derivative languages of more modern times we find *l* of the original language disappearing in numerous instances, and its place supplied by other letters. Of these may be mentioned *d, i, n, u*. For example, *admiral* (English) from *almirante* (Spanish), *piaga* (Italian) from *plaga* (Latin), *Bologna* (Italian) from *Bononia* (Latin), and *autre* (French) from *alter* (Latin.) In French, *ll* after *ai, ei, oui*, as in *travailler*, &c., is pronounced nearly the same as our *y*. The same remark applies to the Italian *gl* before *i*, as in *egli*. In Spanish, *ll* is liquid, as in the foregoing case, and, as in the Welsh, may be placed at the beginning of a word, *e. g.*,—*llaneros*. In English words of one syllable it is doubled at the end, as *tell, bell, knell*; but in words of more syllables than one it is single at the end, as *evil, general, constitutional*. It is placed after most of the consonants in the beginning of words and syllables, as *black, glare, adle, eagle*, but before none. Its sound is clear in *Abel*, but obscure in *able*, and the like.

As a numeral letter, L denotes 50; and with a dash over it thus, *L̄*, 5000. Used as an abbreviation, this letter stands for Lucius. (See ABBREVIATIONS.) LA is the syllable by which Guido denotes the last sound of each hexachord. If it begins in C, it answers to our A; if in G, to E; and if in F, to D.

LAALAND, or LOLLAND, an island of Denmark, in the Baltic, between N. Lat. 54. 38. and 54. 58., E. Long. 10. 56. and 11. 50. It is about 60 miles in length from E. to W., by about 20 in breadth, and has an area of 462 square miles. The surface is low and flat, and in many parts marshy. The principal lake, that of Marieboe, near the centre of the island, is about 5 miles in length. The soil consists chiefly of a heavy loam, and produces abundant crops of corn, flax, hops, potatoes, &c. Woods of excellent timber occur in the island. Pop. about 55,000.

LABADIE, JEAN, the founder of the sect of the Labadists, was born in 1610, at Bourg, in Guienne, and was educated at the Jesuit college of Bordeaux. Expelled from the Catholic church for the gross profligacy of his life, he joined the Protestants, and settling at Montauban, preached for eight years there with great success. His immoralities again threw him upon the world, and he sought an asylum first at Orange and afterwards at Geneva. The assumed austerity and sanctity of his life gained him many followers, and when, in 1666, he exchanged Geneva for Middleburg, the number of his devotees was greatly

Labarum
||
Laberius.

increased. Refusing to acknowledge the synod of Dort, he was formally deposed; and retiring to a little village near Amsterdam, he set up a printing press, and published many works of a half insane, half mystical import. His besetting sin again drove him forth from this retreat, and taking refuge in Altona, he died there in 1674, at the age of sixty-four.

According to their own declaration in their "Confession," the Labadists did not entirely abandon the reformed cause, but still continued to hold the symbolical books. They were a sect of ascetic mystics, who wished reform of life rather than of doctrine. From their belief in the nature of church-membership they were compelled to form an isolated class, and naturally fell into the practice of having property in common. They rejected infant-baptism, and the observance of holy days. Although not guilty of the immoral practices often imputed to them, they fell to pieces in the first half of the 18th century. Hund, Pauli, and Calovius wrote against them. (See *Histoire de la vie de J. de Labadie*, Hague, 1670.)

LABARUM, a military standard of the Roman empire. It consisted of a long lance, crossed at right angles near the top by a staff, from which hung a small flag or streamer of purple cloth inwrought with gold and precious stones, and bearing the effigy of the emperor. Constantine the Great, when he embraced Christianity, substituted for that device a crown, a cross, and the initial letters of the name Jesus Christ, and made it the imperial standard. (Prudent, in *Symmach.* l. 466; Niceph. *H. E.* vii. 37.)

LABEO, C. ANTISTIVS, a celebrated lawyer of the age of Augustus and Tiberius, was son of Antistivs Labeo, who formed one of the conspiracy against Cæsar, and after the unsuccessful battle of Philippi caused himself to be put to death by one of his own slaves. His son seems to have inherited all the independent principles of the father, and to have expressed at times his opinions respecting the measures of Augustus with such freedom, that it was thought by his friends that he was subject to fits of insanity. (Hor. *Sat.* i. 3, 82; Suet. *Aug.* 54.) Some say that he was offered the consulship by Augustus, but that he refused the honour, lest he should be suspected of having sold his independence to the emperor. Others say that he was a candidate for the consulship, and that Augustus caused M. Ateius Capito to be elected in preference to him. (Tacit. *Ann.* iii. 75.) He had applied himself more particularly to the study of law, and left many works, of which scarcely anything remains except the title; eight books on *Probabilities*, of which Julius Paulus made an abridgement; a work in forty-two books, entitled *Posterioriores*, because it appeared after his death. Of these two works fragments are to be found in the *Pandects* of Justinian. The latter is abridged by Jabolenus, who flourished under Trajan. (Gell. xiii. 10.) His other works are,—*Commentaries on the Twelve Tables, and on the Edicts of the Prætor and Curile Ediles; a Treatise on the Prætor Urbanus and Peregrinus; a Treatise on Pontifical Law*, in fifteen books. It is disputed whether some other works mentioned by St Augustin belong to this Labeo, or to another of the same name. (See *Opuscula varia* of Bynkershœck, Leyd. 1719; *De Vita, Moribus, et Studiis Labeonis et Capitonis*, Utreght, 1692.) (C. T. R.)

LABERIUS, DECIMUS, a Roman knight, who was par-

La Borde
||
Labrador.

ticularly distinguished as a writer of *mimi*, that is, farces in the language of the common people, and for their amusement. The exact period of his birth is unknown, but he died B.C. 43, a few months after the murder of Cæsar. Having caused some annoyance to the dictator by the freedom of his language, he was ordered by him to appear on the stage as an actor in one of his own plays, when he had reached the age of sixty. The prologue which he pronounced on this occasion is preserved by Macrobius (*Stat.* ii. 7), and is so beautiful that it makes us regret that more of his writings have not come down to us. When he had finished, he proceeded towards the places assigned to the knights; but his appearance on the stage had deprived him of all the privileges enjoyed by that order, and no one was willing to make way for him. Cicero, observing his embarrassment, said, in allusion to the number of new senators admitted by Cæsar, "Recepissem te nisi anguste sederem;" upon which Laberius sarcastically replied, "Mirum si anguste sedes qui soles duabus sellis sedere," thereby reproaching Cicero with his versatility of conduct. We have the titles of forty of his pieces (see Fabricius *Biblioth. Lat.* i., p. 477), but only a few fragments of them have been preserved. They have been published by Stephanus, Paris, 1564; and are also found in the *Catalecta veterum Poetarum* by Scaliger, and in the *Epigrammata vetera*, Lyons, 1596.

(C. T. R.)

LA BORDE, JEAN BENJAMIN DE, author of the great *Essai sur la Musique Ancienne et Moderne*, was born at Paris in 1734. His family was immensely wealthy. Instead of entering upon active life, as it had been intended that he should, he attached himself to the court, and became *premier valet de chambre* of Louis XV. He became a great favourite with that prince, and more than once brought himself to the verge of ruin by sharing in his costly pleasures. All the time that he could steal from his court duties was gladly devoted to music and the fine arts, of which he was passionately fond, and in which (especially music) he was deeply versed. On the death of Louis XV. La Borde became one of the farmers-general, and the immense revenues of his office enabled him to repair the fortunes he had squandered in his youth. He married, lived quietly, and spent all his spare time in study. One of the first fruits of his labours was his *Essay on Music*, in 4 vols. 4to., 1780. Next year he published a kind of continuation of this work under the title of *Mémoire sur les proportions Musicales, le genre Enharmonique des Grecs et celui des Modernes*. He brought out in a very splendid style several other works bearing on history, chronology, and geography. But these are for the most part mere compilations. In writing his *Essay*, La Borde derived valuable aid from the Abbé Roussier. The best part of the *Ancient History of Music* is his, and the sections assigned to the theory of the art among the Greeks are wholly so. Though somewhat unequal, and quite wanting in unity of design, the *Essai* contains a mass of information so carefully collected and so ably sifted as to be still on many points a final authority.

When the Revolution broke out, La Borde, like all the officials of his class, was obliged to flee for his life. He retired into Normandy, where he lived for some time without being recognised. An unlucky accident discovered his retreat. He was seized, taken to Paris, and there thrown into prison. He might have escaped had he acted prudently, but he insisted on being tried without delay. His trial resulted in his condemnation, and he perished on the scaffold on the 22d July 1794.

LABRADOR, a large peninsula of North America, nearly of a triangular shape, extending from N. Lat. 50. to 63., and from W. Long. 56. to 79. It is bounded on the S. by Canada and the Gulf of St Lawrence, E. by the Atlantic Ocean, N. by Hudson's Straits, and W. by Hudson's

Bay. Labrador is thus detached from the arctic lands, but is nevertheless a country as frozen, desolate, and barren, as those to the W. of Hudson's Bay. The coast along that spacious inland sea is called East Main, and the climate there is peculiarly rigorous. The whole surface of Labrador, indeed, is as sterile and naked as any part of the globe. The prevailing features are rocks, swamps, and water; and vegetation appears as the last effort of expiring nature. Small scraggy poplars, stunted firs, creeping birch, and dwarf willows, thinly scattered in the southern parts, constitute the whole of the trees; herbs and grass are also in sheltered places to be met with; but in the most northerly parts only varieties of moss and lichens are to be found. The whole of the interior, from the aspect of what has been explored, and from the reports of the Esquimaux and other Indians, seems to be broken up with rivers, lakes, and rocks. The prevailing rock contiguous to the sea-shore of Labrador is gneiss. On this, at L'Anse à Loup, the most fertile part of the country, a bed of old red sandstone, about 200 feet thick, is superimposed, and extends about half a mile inland. Here also, as on other parts of the coast, the appearances of the cliffs and of the land near them, and the rolled masses inland, which have evidently been exposed to the action of the sea, seem to prove that the latter has considerably receded. The sandstone is generally red and white in alternate strips, and presents a remarkable mural front to the sea. Near the surface it is strongly marked with iron. The whole of the rock is composed of white quartz and yellow felspar; and the grains, though generally as fine as oatmeal, are occasionally coarser, even to the extent of half an inch in diameter. Over the red sandstone is a thin stratum of red compact felspar, containing vegetable impressions, and also horizontal. Above this are varieties of secondary limestone, arranged in parallel strata several feet thick and full of shells. Detached masses of primitive limestone are also found; and, a few miles from the shore, the secondary formations generally disappeared, leaving gneiss and mica slate on the surface. N. of Cape Charles, on the Labrador coast, the land falls back to the westward, and the shore changes its character, becoming shoal, and running off in flats; whereas to the southward it is bold and abrupt. The prevailing rock, however, is still gneiss, containing numerous veins of granite, from a few inches to many feet in thickness, the constituent parts being mica, quartz, and felspar. The diameter and dip of the gneiss rock is here, as elsewhere on the coast, to the north-west, and at an angle of nearly 65°. It is coarse and dark, hornblende taking the place of mica, and frequently very light-grayish felspar forming the chief constituent. Where this occurs, the face of the hill has a remarkably spotted appearance. On one of the islands which here skirt the coast a large bed of primitive greenstone was found, forming a range of hills resting on the gneiss, and appearing to have the same direction. On the western part of these islands also the gneiss gives place to mica slate, this commencing beyond the above-mentioned range of greenstone, which appears to mark the line of demarcation between them. The mica slate then predominates through all the islands and shores examined to the westward of this point, viz., to the Mealy Mountains, in Sandwich Bay, a distance of about 35 miles. In some places crystals of garnet are very abundant in it, and in others considerable beds of granite are found, of a confused appearance, and in which quartz and felspar predominate. The Mealy Mountains are the highest land on this coast, and are computed to be about 1484 feet in height, covered nearly to the top with wood, notwithstanding the severity of the climate. They are of mica slate, with a dark, fine-grained formation of the same, resembling basalt, at their base. The general rock is coarse-grained. At the foot of these mountains are also found beds eight and ten feet thick, and large rolled masses

Labrador.

Labrador. of a remarkable conglomerate rock, of which the basis is composed of grains of mica, quartz, and felspar; and the imbedded masses are large rounded pebbles of quartz, mica slate, felspar, hornblende, granite, and gneiss. The whole is very hard, eliciting sparks of fire under the stroke of the hammer. The imbedded fragments are all water-worn. On the island of St Paul is found the beautiful mineral Labrador felspar, associated with hyperstene, hornblende, and magnetic iron.

The general aspect of different parts of the Labrador coast has been described by the Moravian missionaries, from whom we learn that Nullatarlok Bay, in N. Lat. 59., is surrounded by high mountains, which are covered with moss, alder, birch, and various shrubs and plants, the valleys in July being grassy and enamelled with a great variety of flowers. The rocks are slaty, easily splitting into plates of from four to eight feet square. At Nachvak Bay the sea was clear of ice in the middle of July, and the magnificent mountains around afforded to the missionaries a most enchanting prospect. Oppernavik, lying between N. Lat. 60. and 61., is not far distant from Cape Chudleigh, where the coast, which was hitherto N., now trends to the S.S.W., embosoming a spacious expanse of water called Ungava Bay. The River Kangerluksoak, in N. Lat. 58. 57., is about 140 miles S.S.W. of Cape Chudleigh. The estuary of the Koksoak lies in N. Lat. 58. 36., at the distance of about 650 miles from the Moravian station Okkak, and is as broad as the Thames at Gravesend. Up the river there is a bay surrounded on all sides by gently rising ground, well wooded with trees of moderate size. For about half a mile a fine slope extends, bounded on each extremity by a hill. The Moravians describe the land as

level and dry, watered by rivulets issuing from the woods, in which were found various European plants and flowers, different kinds of shrubs, such as junipers, currants, and the like, and grass and trees in abundance. The missionaries were informed that, further W., no wood grows along the coast. The soil at L'Anse à Loup is rich, and it is much the most eligible part of Labrador for settlers. Corn will not ripen, but serves for green food; and potatoes, cabbages, lettuce, spinach, and early Dutch turnips, do well. There is generally much rain on the whole coast, but now the temperature would appear to be more equable than it was some fifty years ago, if we may trust to the correctness of the reports of navigators. The current always sets to the southward along the coast. The tides rise six feet to the northward, and about four to the southward. The prevailing winds are from W.S.W. to N.W.

On the coast of Labrador the winter is extremely severe, the thermometer often falling thirty degrees below the freezing point; and although the houses of the Moravian missionaries are heated by large cast-iron stoves, the windows and walls are all the winter covered with ice, and the bed-clothes freeze to the walls. Rum is frozen in the air as rapidly as water, and rectified spirits soon become thick like oil. From December to June the sea is completely frozen over; and so intense is the cold during the winter months, that travelling is sometimes attended with the most painful consequences. The summer months, again, are extremely hot along the coast, the thermometer rising to eighty-six degrees of Fahrenheit, when swarms of musquitoes infest the air.

The mean monthly temperatures at the three northern missionary stations are as follows:—

STATIONS.	Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Year.
Hebron, N. Lat. 58. ⁰	5.24	53.1	4.52	16.83	33.01	36.61	43.57	49.10	38.84	29.43	23.58	5.18	22.52
Okkak ... 57.30	2.15	1.95	8.25	29.0	38.25	44.65	51.65	52.0	44.45	31.15	22.4	8.45	27.86
Nain ... 56.30	0.95	3.51	7.52	29.97	36.23	42.53	50.18	50.99	44.98	33.98	26.51	6.51	27.82

The climate, however, is not insalubrious; and, notwithstanding all its disadvantages, Labrador is of considerable importance to Great Britain. No country is better provided with large, convenient, and safe harbours, or supplied with better water; and vast multitudes of all those kinds of fish common to the arctic seas abound on the coast. Herrings are very fine and plentiful in August, but there is no weather to cure any kind of fish after the tenth of September. The rivers are frequented by salmon and sea trout; and pike, barbel, eels, river trout, and the like, are likewise found in them. On the numerous islands which are scattered along the E. coast multitudes of eider-ducks and other water-fowl breed. Those of large size have deer, foxes, and hares upon them. On the continent the wild animals are principally bears, wolves, foxes, and otters; beavers and deer are not numerous, but their furs are remarkably close and beautiful. The birds of the country are the white-tailed eagle, falcons, hawks, and owls of various kinds; raven, white grouse, ptarmigan, spruce-game, whistling curlew, gray plover, various kinds of sand-pipers and other waders; geese, ducks of various sorts, shags, gulls, divers, and some few species of small birds. During the short summer insects are very numerous, especially in swampy places. In winter they exist in a state of torpidity, from which they are aroused by the solar heat or artificial warmth. The phenomenon of the aurora borealis is uncommonly brilliant in this region, and exercises a very marked influence over the compass.

The exports of Labrador are cod, herring, pickled salmon, fresh salmon (preserved in tin cases), seal-skins, cod and seal oil, furs, and feathers. During the fishing season, from 280 to 300 schooners proceed from Newfound-

land to the different fishing stations on the coast, where about 20,000 persons are employed for the season. About one-third of these vessels make two voyages, loaded with dry fish, back to Newfoundland, during the summer; and several merchant vessels proceed from Labrador with their cargoes direct to Europe, leaving generally full cargoes for the fishing vessels to carry to Newfoundland. A considerable part of the fish of the second voyage is in a green or pickled state, and dried afterwards at Newfoundland. From 100 to 120 vessels come from Nova Scotia and New Brunswick. The principal part of their cargoes goes home in a green state. From 16,000 to 18,000 seals are taken at Labrador in the beginning of winter and spring. They are of a very large size, and the winter residents on the coast are said to feast and fatten on their flesh, which, when young, they account excellent eating.

No accurate account of the trade of Labrador can be obtained, as there are no custom-houses or public officers in the country; but the following estimate is probably as close an approximation as can be made to the annual value of the exports:—

In Newfoundland vessels.....	L.240,000
... Nova Scotia	96,000
... American	96,000
... Canadian	29,000
... Vessels owned or chartered by English or Jersey houses.....	96,000
	<hr/> L.557,000

Some, however, estimate the total exports at L.800,000. The salmon fisheries average annually about 30,000 tierces, not more than 200 of which find their way to Newfound-

La Bruyère land. The herring fishery is carried on by fishermen from Nova Scotia, Canada, Newfoundland, and the United States, and are shipped directly from the coast to a market. Of the seal-oil, seal-skins, furs, and feathers, only a very small portion finds its way to Newfoundland. Merchants and traders on the coast buy them in exchange for their goods, being less bulky and more valuable than fish. The imports of Labrador have been estimated by the authorities of Newfoundland at L.120,000.

One-third of the resident inhabitants are British servants, who take charge of the property left, and likewise employ themselves, in the spring and fall, catching seals. The other two-thirds live constantly at Labrador, and act in the capacity of furriers and seal-catchers on their own account, but chiefly as the former during the winter; in summer all are engaged in the fisheries. Half of these individuals are Jerseymen and Canadians, most of whom have families. There are six or seven English houses, and four or five Jersey houses, established at Labrador, unconnected with Newfoundland, who export their oil and fish directly to Europe.

The Labrador fishery has, since 1814, increased more than sixfold, principally in consequence of our fishermen being driven from the grounds now occupied by the French.

This vast country, equal in square miles to France, Spain, and Germany, has not a resident population exceeding 5000 inhabitants, including the natives and Moravians. The latter, an excellent and truly Christian people, have several settlements on this stern, inhospitable shore; and nothing but the purest spirit of religion and philanthropy could induce them to remain, and zealously labour to enlighten the miserable and disgusting native population. The principal station is at Nain, on the N. shore, where a ship annually arrives from London in July, laden with provisions and other necessities. At Nain there are four missionaries, at Okkak four missionaries, at Hebron three missionaries, and at Hopedale three missionaries. The total number of brethren was twenty-eight in 1852; and there were 1326 Esquimaux converts to Christianity. These Moravians came from Greenland about the middle of the last century, in the prosecution of their pious undertaking to enlighten the heathen. Their habits and mode of life are simple and quiet, corresponding to their isolated condition. Their trade is wholly with the Esquimaux, with whom they barter coarse cloths, powder, shot, guns, and edge-tools, for furs, oils, and other articles, the produce of the country. The Esquimaux, the most filthy and disgusting tribe yet discovered on the shores of America, are thinly scattered along the coast of Labrador. The greatest number of them in any one place appears to be at Inuvutoke Inlet, or Esquimaux Bay, on the Atlantic coast of Labrador, where there are about 250. (For a description of the Esquimaux, see the article GREENLAND.) The Canadians and others residing at Labrador employ these people in catching fish, and the like. Labrador belongs to the government of Newfoundland. During summer there is a court held, from which appeals are made to the supreme court of St John's. An armed vessel visits, and continues generally along the coast, during the greater part of the fishing season. (A. P.)

LA BRUYÈRE, see **BRUYÈRE**, *Jean de la*.

LABUAN, a small island in the Malay Archipelago, belonging to Britain, and lying off the N.W. of Borneo, about 30 miles N. of the town of that name, in N. Lat. 5. 22', E. Long. 115. 10. It is about 10 miles in length by 5 in breadth. (See BORNEO.) In 1854 the population (exclusive of military) was 1150; revenue, L.3535; expenditure, L.4307; vessels entered, 555; tonnage, 8682: cleared, 30; tonnage, 8114: value of principal imports, L.23,742; exports, L.15,382: coal sold, 6805 tons.

LABYRINTH, an intricate structure, with numerous

winding passages so involved and perplexing as to make exit or entrance without a clue almost impossible. Three great labyrinths are mentioned by ancient writers. The earliest and by far the most famous was that at Arsinoë, near the Lake Moeris, in Egypt. It is described by Herodotus and Pliny as having 3000 rooms, of which one-half were under ground. It was extant in the time of Pliny; but its ruins, if they still exist, have not yet been identified. According to Herodotus, it was used as a burial place for the kings and sacred crocodiles of Egypt. Another labyrinth, frequently alluded to in the classics, was that near Cnossus, in Crete. Tradition describes it as built by King Minos, on the model of the Egyptian one, but on a much smaller scale. The same legends make it the abode or prison of the Minotaur. None of the writers who mention this labyrinth describe it from personal inspection. No remains of it have ever been found, and it is probable that the tradition had merely in view one of the large natural caverns that abound in Crete. A third labyrinth is mentioned in the isle of Lemnos, similar in plan to that of the Lake Moeris. It is said to have been completed about the middle of the eighth century B.C. Remains of it were extant in the days of Pliny. Some have set it down as a temple of the Cabiri, but to what uses it was really put is unknown. Only one structure of this kind is known to have existed in Italy, the labyrinthine tomb of Porsena, near Clusium. See **CLUSIUM**.

LAC, a resinous substance formed on various trees in the East Indies by the punctures of an insect (*Coccus Lacca*), the exuding juice being formed into cells for its eggs. The resin encrusts the branches in grains; these branches, when gathered, are exported under the name of *stick-lac*; but when the grains are gathered, the colouring matter extracted, and the grains formed into flat cakes, the name of *seed-lac* is given, the granular appearance being still preserved; when the seed-lac has been melted up and formed into masses, it is called *lump-lac* or *button-lac*; when the seed-lac is further purified by melting over a charcoal fire, straining through bags of fine linen, and drying in thin layers on smooth surfaces of wood, it forms *shell-lac*, known as orange or ruby, according to the colour. The colouring matter of lac is used as a red dye on wool, but is inferior to cochineal. The chief use of lac in Europe is for making sealing-wax, and as a basis for *spirit varnishes*, and the so-called *French polish*. Shell-lac is commonly used for the purpose, but as the palest variety contains colouring matter, it cannot be employed for varnishing works of a light colour. It also contains a little wax, and other matters not soluble in spirits of wine, or pyroligneous spirit, which is commonly used for the purpose, the effect of which is to make the varnish cloudy; this is unimportant in varnishing dark coloured works, and may be avoided by making the solution without heat, and decanting the clear portions from the insoluble.

The best stick-lac comes from Siam, that of Assam ranks next, while that of Bengal is inferior. The colouring matter is obtained by pouring warm water on the stick-lac. The colour is made into square cakes, and sold under the name of *lac-dye*, *lac-lake*, or *cake-lake*. There are various methods of bleaching lac, by means of chlorine, animal charcoal, &c. Lac gives the name to, and enters into the composition of, various *lackers*. See **DYEING**, iv., §§ 1, 4; **LACKER**; and **VARNISHES**. (C. T.)

LA CAILLE. See **CAILLE**, *Louis Nicholas de la*.

LACCADIVES, an archipelago of low islands lying off the western coast of India, between 8° and 13° N. Lat. There are nineteen considerable ones; but as most of them are surrounded with reefs and steep rocks, with a great depth of water close to them, the approach to them is very dangerous. Between these islands there are many channels, through which ships from India, bound to Persia or Arabia,

Lac
Laccadives

Lace.

frequently sail. The safest of these is called Mamale, or the Nine-degree Channel, which runs between the islands of Seuhilipar and Kalpenny. The largest of these islands is about 7 miles in length and $2\frac{1}{2}$ in breadth. Most of them are inhabited by a race of Mohammedans called Moplays. They do not yield grain, but produce an infinite quantity of cocoa-nuts, from the husks of which they form the *coir* cables, which are more elastic and durable than hemp, as the sea-water, instead of rotting, preserves them. These islands are well supplied with fish, and carry on a trade with the small shells called *courries*, which pass as coin all over India and most of Africa. Most of these islands are under the uncontrolled management of the beebie of Cannanore, subject to the payment of an annual tribute to the British government. A proposal has been made to the beebie to transfer them to the British, in consideration of a pecuniary equivalent. They were discovered by Vasco de Gama in 1499, but have since been little frequented by Europeans.

LACE, from *lacinia*, the guard hem or fringe of a garment, is a plain or ornamented network, consisting of threads of gold, silver, silk, flax, or cotton, tastefully interwoven so as to form a beautiful texture. This delicate fabric appears to have claims to high antiquity, but its origin is involved in considerable obscurity. That it was worn by Grecian females is certain, and the derivation of the word *lace* affords presumptive evidence that it was also in use amongst the Romans. In Venice, and the neighbouring states of Italy, it was very early worn; and Mary of Medicis is supposed to have been the first who introduced its use into France; but as early as 1483 it was included in a list of articles prohibited from importation into England. Hence it had been made in this country *prior* to the period above mentioned; and this prohibition, like many other subsequent acts, was for the protection and encouragement of home manufactures. But *pins*, which are indispensable in the process of fine lace-making, were unknown till long afterwards; so that it is probable the fabric made was neither very fine in texture nor produced to any great extent. It is uncertain by whom the manufacture of lace was originally introduced into this country. About the middle of the seventeenth century the lace trade was flourishing in Buckinghamshire; and so greatly had it advanced in England, that, by a royal ordonnance in France, passed in 1660, a mark was established upon the thread lace imported from this country and from Flanders, and upon point lace from Genoa, Venice, and other countries.

Pillow, or Thread Lace, is made by placing a perforated pattern on a hard stuffed pillow, and the thread required is wound upon bobbins with a groove in the upper part for retaining the thread; while, to form the meshes, pins are stuck in the cushions, and threads woven or twisted round them, the pattern showing the points of insertion for the pins, and also the direction for the gimp, which is interwoven with the fine threads of the fabric to form the pattern. At the commencement of the work the bobbins are arranged on one side of the cushion, and are brought to the front side, two pairs at a time, and twisted together. The woman holds one pair of bobbins in each hand, and twists them three times over each other to form the sides of the mesh, the adjacent bobbins of each pair are next interchanged, so as to cross these threads over one another to form the bottom of the next. Supposing the four bobbins to be marked 1, 2, 3, 4,—No. 1 is twisted round 2, and No. 3 round 4; these, in order to cross 2 and 3, are interchanged, so that 1 and 3 and 2 and 4 come together, and at the next twist these pairs of threads will be combined. As the meshes or half-meshes are formed, they are secured by pins. These four bobbins are now put on one side of the cushion; two more pairs are brought forward, twisted and crossed as before, and these operations are repeated until a row of meshes is formed of the required breadth,

when the bobbins are worked over again to form another row. From 48 to 60 bobbins are required for every inch of breadth. Pillow or thread lace, formerly employed a large number of women and children in the counties of Bedford, Buckingham, Northampton, and Oxford, but the demand for this kind of white thread lace failed, and black lace took its place. *Honiton lace* differs from pillow lace in having the pattern made separately. The ornaments were formerly confined to simple sprigs and borders; but the fabrics now produced show extreme delicacy of execution, with beauty and taste in design: flouncings, shawls, scarfs, handkerchiefs, berthes, &c., now vary in price from 10 to 200 guineas. The Honiton lace district extends about 30 miles along the coast of Devonshire, and about 12 miles inland. In 1851 from 7000 to 8000 persons were employed in the manufacture.

British point, tambour, and Limerick laces are chiefly imitation, and are produced in shawls, scarfs, dresses, court trains, flouncings, lappets, &c. British point is made chiefly in the neighbourhood of London, tambour chiefly at Islington, Coggleshall, and Nottingham, while Limerick lace is peculiar to Ireland. Black laces now occupy a considerable portion of the attention of the trade.

The most celebrated laces have been classed as,—1. *Brussels*, the most valuable. There are two kinds: *Brussels ground*, having a hexagon mesh, formed by platting and twisting four threads of flax to a perpendicular line of mesh; *Brussels wire ground*, made of silk; meshes partly straight and partly arched. The pattern is worked separately, and set on by the needle. 2. *Mechlin*: a hexagonal mesh, formed of three flax threads twisted and platted to a perpendicular line or pillar. The pattern is worked in the net. 3. *Valenciennes*: an irregular hexagon, formed of two threads, partly twisted and platted at the top of the mesh. The pattern is worked in the net similar to Mechlin lace. 4. *Lisle*: a diamond mesh, formed of two threads platted to a pillar. 5. *Alençon*, called *blond*: hexagon, of two threads, twisted similar to Buckingham lace; considered the most inferior of any made on the cushion. 6. *Alençon point*: formed of two threads to a pillar, with octagonal and square meshes alternately.

In the manufacture of lace France takes the lead; and it is calculated that the production of lace by hand gives employment in that country to upwards of 200,000 females of all ages. It is all made with bobbins upon a small pillow, except at Alençon, where the needle only is employed. The materials used are hand-spun linen thread, cotton, wool, silk, and gold and silver thread. *Point d'Alençon* is the only lace made with pure linen hand-spun thread; this thread is worth from L.100 to L.120 per pound. White lace is now chiefly made with cotton thread, Nos. 120 to 320. The principal seats of the manufacture are,—Caen and Bayeux, Chantilly and its neighbourhood, Lille, Arras, Mirecourt, Puy, Bailleul, and Alençon. Each of these districts has its own peculiar style; and although the lace may be made in the same way, and with the same material, in all these districts except the last, yet each is easily recognised. Silk blond originated at Caen, and was so called from being made of undyed silk of a nankeen colour: the finest white or the finest black silk is now employed. Caen and Bayeux excel all other places in the production of piece goods, and manufacture shawls, robes, mantles, &c., more extensively than any other districts in the world. By means of a stitch called *rucroe*, the women of the department of Calvados join several parts into one piece so cleverly as to defy detection, even with a magnifying glass. Most of the improvements and novelties in lace-making originate at Mirecourt; it produces the same kind of lace as Lille and Arras, viz., clear foundation, *fonds clair*, and also *fonds de champs*, in white thread, also a lace resembling the Honiton called *guipure*.

Lace.

Lace.

Flowers are also made, and sewed upon the extremely fine net called Brussels net, closely resembling the Belgian fabric. The whitest and cheapest French lace is produced at Bayeux.

Belgium is the great rival of France in the manufacture of laces, the chief varieties of which are known as *Brussels*, *Mechlin*, *Valenciennes*, and *Grammont*. Brussels produces two descriptions of lace, known as *point à l'aiguille*, and *Brussels plait*, the one made entirely with the needle and the other on the pillow. The finest kind is made of very fine flax thread, and some of cotton: it is remarkably soft and clear, but very costly. Mechlin laces are made at Malines, Antwerp, &c. They are made in one piece on the pillow, and the flowers are surrounded by a plait thread, which designs the outline, and has the effect of embroidery. Valenciennes laces are made chiefly at Ypres, Menin, Courtrai, Bruges, Ghent, Alost, and their respective neighbourhoods, each town having its characteristic peculiarities by which its productions are identified. Ypres produces laces of the finest square grounds, varying in price from 6d. to L.50 the English yard.¹

It is natural to suppose that attempts would be made to lessen the cost of production of so beautiful and costly an article as lace. It was not, however, until machinery had been largely introduced for the purpose of manufacturing textile fabrics that lace machinery can be said to have been successfully employed. About the year 1768 a framework-knitter of Nottingham employed the common stocking-frame in the manufacture of lace, and about the same time another person of the same place introduced a pin machine for making single-press point-net in imitation of the Brussels ground. Various machines were from time to time introduced, all of which, except the *warp machine*, have been superseded by the *bobbin-net machine*, so called from the circumstance that the thread that makes the lace is partly supplied from bobbins and partly from a warp. The first successful machine of this kind was made and patented by John Heathcote in 1809, the principle of which was to pass the bobbins from front to back, and from back to front, while a lateral motion was imparted to the warp-threads, thus causing one series of threads to wrap round the other. The first machine was so complicated, that sixty motions were required to complete one hole, an effect that can now be produced with six. The cost of production has also more than proportionally decreased; for in 1815 one square yard of the produce was worth 30s., and can now be purchased for 3d. Up to the year 1831 plain net and quillings were the chief produce of the bobbin-net machine; but about this time methods were introduced to *purl* and *bullet-hole* the edges of narrow laces, finishing them afterwards, with a gimp thread, with the needle. The machines used were known as the *Leavers*, named after the original constructor; the *pusher machine*, so called from having independent pushers to propel the bobbins and carriages from front to back, instead of pulling or hooking them; the *circular machine*, so called from the bolts or combs on which the carriages pass being made circular instead of straight; the *traverse-warp machine*, so called from the warp traversing instead of the carriages. About the year 1839 the *Jacquard* apparatus was successfully applied to a pusher machine; and since 1841, when a plan was discovered for applying the Jacquard to the guide-bars, scarcely a machine has been worked without the ornaments being applied by means of cards. New sources of manufacture soon developed themselves, such as flouncings, scarfs, shawls, window-curtains, &c. Lace goods are now manufactured for all parts of the world, and lace-designers—greatly assisted by the Government School of Design at Nottingham—have proved themselves adequate to the de-

mands of a diverse and greatly extending trade. At the time of the Great Exhibition the articles manufactured by the bobbin-net machines consisted of—1st, Black silk piece-net ornamented, shawls, scarfs, flouncings, trimming-laces, blonds in white and colours, some finished on the machines, others ornamented partly by machinery, and afterwards embroidered by hand. Such goods are exported annually to the value of upwards of L.150,000, and they are lower in cost by from 75 to 90 per cent. than the class of hand-made articles which they represent. 2d, Cotton edgings, laces, insertions, linen laces, in imitation of white pillow lace, muslin edging and laces, fancy-piece net, spotted net, plain net, in imitation of the costly Valenciennes lace. 3d, Curtains in imitation of the Swiss bed-covers and blinds. 4th, Silk and cotton goods, plain net Mechlin grounds, blond, Brussels or extra twist.

In the year 1851 there were 3200 bobbin-net machines in operation at Nottingham, representing, with the subsidiary trades, a total capital of L.2,965,945; the total number of hands employed, 133,015; and the annual amount of business returns was estimated at L.2,300,000.

Before proceeding to notice the construction of the bobbin-net machine, it may be useful to remark, that a piece of lace (figs. 1 and 2) consists of a series of nearly parallel

Fig. 1.

Fig. 2.

warp-threads, lying in one direction, with a weft-thread twisting once round each warp-thread until it reaches the outer one, and then making two turns, and proceeding to the other border in a reverse direction. The double twist and the return of the weft-threads forms the selvage. This twisting and interlacing of the warp and weft produce regular six-sided meshes. It will be seen from the figures that the fabric is formed by the union of three sets of threads, the one forming the warp proceeding in a waving line (fig. 2) from the top to the bottom; the second set proceeds to the right, the third to the left, the two latter being weft-threads, which cross obliquely in the centre between every two meshes, one set of weft-threads drawing the warp to the right, and the other to the left. When the warp-threads have been laced twelve times by the weft, the latter is moved sideways through one interval of the warp. In ordinary weaving the threads of the warp are alternately raised or depressed for the passage of the weft; but in lace-making the warp-threads are shifted sideways to the next pair, to which they are united by the weft-threads, which also work in pairs, each entwining two individual threads at once.

The thread for the warp is wound upon a roller, and for the weft upon small bobbins. Fig. 3 represents one of the bobbins B, mounted in its carriage c, and shown detached in section at B'. It consists of a couple of thin brass disks, with a square hole in the centre, and rivetted together with a smaller disk between, so as to leave a circular groove for the reception of the thread. From one to two hundred bobbins are spitted upon a square spindle, and mounted in a frame; the thread is conducted from a drum through the slits of a brass plate, and a thread being attached to each bobbin, the spindle is turned round, when the drum revolves and delivers its thread. About 100 yards of thread

¹ Further details of the statistics of lace will be found in the "Jury Report of the Great Exhibition of 1851, class xix., and some remarks on lace design in the "Supplementary Report on Design."

Lace.

are wound on each bobbin, which quantity is indicated by a hand moving round a dial-plate in connection with the re-

Fig. 3.

volving apparatus. As many as 1200 bobbins may be required for one machine. Each bobbin is inserted in a small iron frame or bobbin-carriage, in which it is held by a spring *s* (fig. 3), and the thread *t* passes out through an eye at the top; on gently pulling this thread the bobbin turns round.

The working parts of the machine are shown in a vertical section or end view (fig. 4), in which *A* is the thread-beam containing the warp, and *B* a similar roller for receiving the finished work. Between these two rollers the warp-threads are extended vertically, and they are strained over guide-bars, *a, a*, from which the threads pass through the eyes of needles, *n*; each guide-bar has a shagging or slightly shifting motion to the right and to the left, to allow the bobbins to pass to the right or to the left of the warp-threads as often as is necessary to produce the twist. The bobbins are arranged in a double line in two rows, *c c* (fig. 4), on each side of the warp-threads, and the bobbin-carriages are supported between the teeth of a comb, *CC* (fig. 4), shown separately in fig. 3, each bobbin-carriage having a groove for the reception of the teeth of the comb. It will be seen from fig. 4 that there is a comb on each side of the work, and the free ends of the teeth in the opposite combs are so near to each other that there is only sufficient space for the proper motions of the warp-threads between them, so that the carriages, in passing across through the intervals of the warp, reach the back bolts before they have entirely quitted the front ones. The bobbin-carriages are alternately driven from one comb to the other by two bars, *b, b*, and when one of the lines of carriages is pushed nearly across the intervals of the warp, the foremost of the catches projecting below the comb comes in contact with a plate *d*, attached to a revolving shaft, and this pushes it quite through. The beam to which the combs are attached has a short sidelong motion, by which the relative position of the opposite combs is changed by one interval or tooth, so as to transfer the carriages to the next adjoining teeth, by which means all the carriages make a succession of side steps to the right in one

Fig. 4.

comb, and to the left in the other, whereby the bobbins cross each other, and again twist round the vertical warp-threads, so as to form the meshes of a net. When the bobbins have moved several times round the warp-threads, a point-bar shown on the left, a little above *b* (fig. 4), containing a row of pointed needles, falls between the warp and weft threads, and carries up the interlacings of the latter to form a new line of holes or meshes in the lace. Here it remains while the other point-bar makes a similar movement to form a second line of meshes, so that the working of the machine consists of a repetition of twisting, crossing, taking up the meshes, and winding the finished lace on the roller *B*.

Bobbin-net lace owes much of its beauty to the quality of the threads, and the correct shape of the meshes. By increasing the number of warp-threads within a given space the meshes are reduced in size, and finer lace is formed. There may be from 700 to 1200 and upwards of warp-threads in a piece one yard wide. The fineness, or *gauge* or *points*, as it is called, depends on the number of slits in the combs, and hence on the number of bobbins in an inch; thus, *gauge nine points* indicates nine openings in 1 inch of the comb. The length of work counted vertically, and containing 240 holes or meshes, is called a *rack*. A circular-bolt machine may produce about 360 racks per week. Bobbin-net is made up in pieces of from 20 to 30, or more, yards in length, and of variable breadth. Narrow quillings are worked together in a number of breadths, united by threads, which are afterwards drawn out. In well made lace the meshes are slightly elongated in the direction of the selvage. Ornaments, consisting of separate flowers, sprigs, &c., are worked in by a Jacquard apparatus attached to the frame; but as the ornaments are all necessarily connected by the thread of gimp which forms them, the connected thread is afterwards cut out with scissors, by children employed for the purpose. Where the machine produces only plain net, the pattern is worked in by hand, the lace-runner being guided by a lithographic pattern placed under the net. When the embroidery is complete, it is examined, defective parts are marked by tying the lace in a knot, and these are restored by a distinct set of women called *lace-menders*. The net is gassed before being embroidered; bleaching or dyeing is performed afterwards; dressing, rolling, pressing, ticketing, and making up, resemble the processes described under CABLE-LENDERING.

In addition to the bobbin-net machine for making lace, there is also the *warp-machine*, invented about the year 1775. It was suggested by the stocking-frame, in which only one thread is required, whilst in the warp-frame there is a thread to each needle. The first articles made by it were silk stockings, with blue and white zig-zag stripes, or *vandykes*, as they were called, from the name of one of the four claimants to the invention of the warp-frame, the other three being Englishmen. About 1784, a Nottingham mechanic greatly improved the warp-frame by the application of the rotatory motion, and the cam wheels to move the guide-bars, still known as *Dawson's wheels*. The improved frames produced officers' sashes, purses, braces, and other elastic textile fabrics, the manufacture of some of which still continues. In 1796 a new fabric was produced from the warp, and employed for sailors' jackets, pantaloons, and the article known as Berlin, so much used for making gloves. Warp-machines were the first to produce ornamental patterns on lace, such as spots, bullet-holes, &c., which had been previously embroidered or tamboured by hand. The bobbin-net machine, invented in 1809, soon became a formidable rival of the warp, and influenced its fortunes in various ways, until 1839, when the Jacquard apparatus was applied to it, and so much increased its capabilities as to introduce into the warp-lace trade of Nottingham a new class of products of elaborate design, such as shawls, scarfs, mits, falls, laces, &c. Of late years, the

Lace.

Lace. *twist-machine* has been employed on similar goods, and has to a great extent superseded the warp. Great improvements have also been introduced in the English methods of *dressing* lace, especially in silk goods. Many new kinds of elastic fabrics, in gloves, in silk, and other materials, have been introduced. Velvet, and velvet in combination with lace, have also been produced at the warp-frame. At the time of the Great Exhibition there were about 1400 warp-frames in operation, namely about 600 in Leicestershire, about 400 in Derbyshire, and about the same number in Nottinghamshire. The employment in the various branches was estimated as follows:—150 machines engaged in the production of blond, and other silk laces; 150 in cotton tatting, 550 in Leicester hosiery, &c., 100 in lace gloves and mits, 150 in woollen cloth, hosiery, purses, and various fabrics for gloves, &c. The first machines were about 16 inches in width; they are now, in the Nottingham trade, from 90 to 150 inches in width, and in the Leicester hosiery trade, from 44 to 72 inches. The number of persons employed in the warp trade in 1851 was estimated at 10,000, and the capital invested at L.360,000, making a return per annum of L.700,000. In the Great Exhibition was exhibited a power machine, capable of producing (working 12 hours per day) 800 racks per week, which, when dressed, would be equal to about 1200 square yards. A yard of 4-quarter white silk blond, which in 1830 cost 2s., can now be had for 6d.

*Gold and silver lace.*¹ The textile fabric known as gold or silver lace consists of warp threads of silk, or of a mixture of silk and cotton, while the weft or shoot is a silk thread covered with silver, or with silver gilt, as the case may be. The production of this thread is a remarkable illustration of the extensibility of gold, and of the ductility of silver. The silver preferred by the wire-drawers is that which has been separated from argentiferous galena, this being less brittle than the silver obtained from purer sources. From 400 to 500 ounces are cast into an ingot about 2 inches in diameter, and from 20 to 24 inches in length. This is made red-hot in a charcoal fire, and hammered until sufficiently reduced to pass through the first hole of the draw-plate, the hammering increasing the tenacity and elasticity of the metal. After the bar has been reduced by passing through 10 or 12 holes, it is planed, in order to remove any imperfections from the surface which would interfere with the perfect gilding; the blemishes are readily detected by the reflection of a sheet of foolscap paper slightly arched, and placed over the bar. The bar is now gilt, by placing on it a number of gold leaves, varying from 10 to 30, according to the richness of the wire required, the higher qualities being used for military purposes, and pearls and bullions for embroidering, while the lower qualities are used for liveries, the ends of muslins, and for skein threads exported to India and China. The gold leaves are placed in a row, side by side, nearly the length of the bar, on a piece of cartridge paper: the bar is then gently placed on the leaves, pressed close, and the edges of the leaves raised up until the silver is entirely covered. The bar is next enveloped in paper tied tightly round with cord, and placed in a charcoal fire, where it is left until it becomes of a bright red heat, the paper not burning but becoming red with the metal, when it slowly consumes, after which the bar is withdrawn. While still red-hot it is burnished with a blood-stone or with South Sea axe-stone, for the purpose of uniting the gold and the silver perfectly. When cold the surface is covered with wax, and the bar is drawn into wire through graduated steel dies, and, after one or two annealings, finished by drawing through perforated rubies, so fine, that from an ounce of metal a wire a mile and a quarter in

length is produced. At this point the wire has not so rich and deep a shade of yellow as is required, but this is given by winding the wire round a copper cylinder, with the addition of a small portion of wax, and filling the cavity of the cylinder with red-hot charcoal made from birchwood, the effect of which is to deepen the colour and render it permanent. The next process is to flatten the wire by passing it between a couple of steel rollers, one of ten, and the other of four inches in diameter, made of the finest steel, and of exquisite polish. They are manufactured in Rhenish Prussia, at a cost of L.120 for a single pair of rollers. The flattened wire is wound on small bobbins, which are placed in the centre of circular rings, attached to a bar, over a spinning frame. On the front of the frame are bobbins of silk, the threads of which pass through the centre of the ring to which the reel of wire is fixed. The whole is set in motion, and while the thread is being twisted, the ring with the wire revolves round the thread in the opposite direction. In this way from 30 to 40 threads are covered at once, the result being a resplendent flexible gold thread, adapted to the purposes of lace-making, embroidery, &c. Of this thread, although gold only appears, probably nine-tenths of its bulk is silk, while of the remaining $\frac{1}{10}$ th only $\frac{1}{10}$ th part is gold.

It is highly probable that the process of electro-gilding will greatly simplify some of the above processes, but the plans hitherto adopted for the purpose have not been successful. Mr A. Hock has contrived a mechanical process for the gilding of fibres. The silk used for the purpose must be of good quality, free from knotty nibs and rough places. The gum must be boiled out, and the silk be dyed of a light orange tint. It is then wound on bobbins, from which it is passed through a trough containing a glutinous transparent liquid. It is now passed over a reel attached to an endless screw or threaded spindle, arranged so as to lay the silk in close coils on a brass cylinder. Gold leaf is then applied to the silk until the entire surface of the roller is covered. The roller is then turned round, and a burnisher of wood covered with cloth or wash-leather is applied: this presses the leaf close to the silk, and separates it between the windings, thus gilding the thread, which may be of as fine a quality as desired. If the entire thread is to be gilded, it is wound on another cylinder, so as to expose the ungilt part of the thread, and the process is repeated. It is next wound on reels, dried, and then transferred to boards or *planchettes*, and is ready for the market. The thread is of the natural colour of the gold leaf; it is light, and perfectly flexible. Fabrics made of this gilded silk are much lighter than those produced with the ordinary gold thread. (C. T.)

LACÉDÆMON. See SPARTA.

LACÉPÈDE, BERNARD-GERMAIN-ÉTIENNE DE LA VILLE-SUR-ILLON, COMTE DE, an eminent French naturalist, was born December 26, 1756, at Agen, the chief town of the department of Lot-et-Garonne, in the S. of France. His father, the Comte de la Ville, lieutenant-general of the Sénéchaussée at Agen, gave him the name of Lacépède, in honour of a rich relative who had made him his heir. The family is admitted by Cuvier, in his *Eloge Historique* on Lacépède, to have been one of the most ancient and honourable in the province. At an early age the future naturalist lost his mother, but his education was conducted with the most anxious care by his father. Pains were taken that all his early impressions should be of good; and for a long time he did not know what a bad book or a bad man was. "At the age of thirteen," he writes in his *Memoirs*, "I still believed that all poets were like Racine or Corneille, all historians like Bossuet, all moralists like Fénelon." In his solitude at the Castle of Lacépède he read largely the best

¹ Fuller details on this subject will be found in the *Journal of the Society of Arts*, No. 178, in the Report of Mr F. Bennoch's paper on "Thread or Fibre Gilding."

Lacépède.

French authors, and learned to observe and reflect. One of the first books put into his hands was Buffon's *Natural History*, which he read and re-read till he knew it nearly by heart. Buffon became his model, and his time was henceforth cheerfully given to the study of natural history and philosophy in all their branches. Music was the only amusement he allowed himself. He was passionately fond of it, and besides playing admirably the piano and the organ, he composed with no mean skill and success. The only two operas he ever wrote were highly praised by Gluck, though neither of them was ever brought on the stage. Lacépède's first experiments were on electricity, and one of these had very nearly proved fatal to him. The results, when communicated to Buffon, drew forth so encouraging an answer from the old man that his correspondent immediately set off to Paris to see him. In the capital he fell in with a German prince, who offered him a colonelcy in the imperial army. He closed with the offer, but never joined, or even saw, his regiment, though he wore its uniform, and called himself its colonel. He made his début in authorship in 1781 by his *Essai sur l'Électricité*, which he followed up, two years later, by his *Physique Générale et Particulière*. Both of these works were written on the same principles as Buffon's *Natural History*, though their subjects manifestly called for a very different mode of treatment. Their author became convinced of his mistake when it was too late, but obviated its bad consequences by buying up and destroying every copy of both works on which he could lay his hands. Charmed with the devoted attachment of his young friend, Buffon appointed him in 1785 sub-demonstrator in the Jardin du Roi; and as his own strength was now beginning to decay, proposed that he should continue the *Histoire Naturelle*. Lacépède accepted the proposal, and continued his researches with renewed zeal under the eye of his friend and teacher. In 1788 he published, as a continuation of Buffon, his *Histoire Naturelle, Générale et Particulière, des Quadrupèdes Ovipares*; and in the following year another volume *On Serpents*. "This work," says Cuvier, "by the interest of the facts embodied in it, and in a strictly scientific point of view, presents incontestable advantages over the immortal work of which it is the continuation." No races are visible of that antipathy to method and a precise nomenclature which marks Buffon's part of the work. Lacépède established classes, orders, genera, characterized clearly subdivisions, and enumerated and named with care the species that strictly belong to each. But with all the method of Linnæus, he is as little philosophical as he, forming his groups entirely upon external characters, and disregarding internal structure and anatomical relations altogether. When the French Revolution broke out, Lacépède, though by birth an aristocrat, was at first favourable to it. He was twice president of the Parisian Electoral Assembly, and in 1791 became a deputy of the Legislative Assembly. He never attained any eminence, however, either as a speaker or as a politician. When the course of events seemed to bring his life into danger, he lost the little courage he had, and fled from Paris altogether, only returning thither when the death of Robespierre had put an end to the Reign of Terror. When the Jardin du Roi was re-organized as the Jardin des Plantes, he was appointed to the chair set apart for the history of fishes and reptiles. In 1796 he was chosen into the Institute of France, and two years later gave to the world his *Histoire Naturelle des Poissons*, of which the fifth volume appeared in 1803. This treatise was undoubtedly the greatest in that branch of science till it was driven out of the field by the much more comprehensive and philosophic work of Cuvier and Valenciennes. Lacépède's work was founded on the lists of fishes drawn up by Gosselin and Bonaterre, and included the specimens added to the royal collection before the war, as well as those in

the cabinet of the Stadtholder, brought to Paris after the conquest of Holland. Further than this it can scarcely be said to have enlarged the limits of the science at all. His work is consequently very incomplete, but it should be remembered that the comparative anatomy of fishes was in his day very little studied, and, from the political state of the country, the difficulty of procuring new specimens greater than it had ever been before or has been since. In society Lacépède was easy, polite, and anxious to agree with every body. He carried the same spirit into his scientific researches, listened believingly to the lies of travellers, and took for gospel everything that had been written by previous inquirers. Hence the complete absence of searching criticism, and the gross mistakes which, with a little care, he might easily have avoided. In 1814 appeared his *Histoire Naturelle, Générale et Particulière, des Cétacés*, the last and best of his separate works, though open to the same objections as have been already raised against his *Natural History of Fishes*. From this time, till his death, his public duties took up so much of his time that, except an occasional article in the *Annales du Muséum*, he made no further contribution to science. In 1799 he became a senator; in 1801 he was made president of the senate, and two years later grand chancellor of the Legion of Honour. In 1804 he was created a minister of state, and at the Restoration a peer of France. During the Hundred Days he again took office under Napoleon, as grand master of the university. He died at Épinay, October 6, 1825, in the seventieth year of his age.

With many of the qualities of a good naturalist, Lacépède wanted many that were indispensable. Many of his scientific errors are directly traceable to defects in his personal character. He was pre-eminently wanting in independence of character. Like the vicar of Bray, he cared little who sat on the throne of his country, if he retained his offices. "It is now six-and-twenty years," he wrote, "since the Revolution broke out, and during all that stormy period, thanks to Providence, I have never once failed of the obedience due to the laws and the established government." Every government in succession accepted and trusted him, because he accepted it. Indeed, he never contented himself with recognising each in its turn, but went out of his way to welcome it with the most servile adulations. In allusion to his fawning habits, and to the nature of his studies, he was nicknamed by his contemporaries "the Prince of Reptiles." But though he cringed abundantly to the men in power, he was kind and gentle to those of station lower than his own. He did a great deal of good in a very unostentatious manner, and spent the whole of his private fortune in charities. More than once he was only saved from serious embarrassments by the generosity of Napoleon. So popular had his liberality made him, that his death was mourned as a public calamity.

LACHESIS. See PARCÆ.

LACHMANN, KARL, a distinguished critic and philologist, was born at Brunswick, 4th March 1793. His love of literature displayed itself during his early education at his native town, and only became more deeply rooted as he advanced to the scientific study of languages at the universities of Leipzig and Göttingen. It was at Göttingen, under G. F. Benecke, with whom he was afterwards associated in literary labour, that his attention was first directed to the early literature of Germany and northern Europe. During 1815 he served in the Prussian volunteer corps against Napoleon, and in the following year was appointed teacher in the Frederic Gymnasium of Königsberg, whence he was speedily promoted to a professorship in the university. In 1827, he was elevated to a chair in the university of Berlin, and he continued to discharge the duties of his office till his death in 1851. On the Continent he is perhaps best known as a careful editor of

||
Lacker.

the classics, and a masterly critic both of classical and Teutonic antiquity; but in England his fame rests almost exclusively on his editions of the New Testament and Vulgate. These last were published, the smaller edition drawn from what he styles oriental sources alone, in 1842; the larger, embracing both eastern and western authorities, in 1850. His critical scheme is expounded by himself in the *Studien und Kritiken* for 1830. The text is peculiar, being compiled on a clear and definite, although too mechanical plan, and may be defined as the most historically attested reproduction, without by any means being the best representation, of the original. With mathematical precision he follows the authorities of the first four centuries, to which he attaches a value somewhat arbitrary; and it is inconsistent with his plan to avail himself of internal evidence, even in removing what is a blunder by confession. His labours have thus only a partial utility; and Tischendorf has successfully pointed out various passages in which Lachmann has deviated from the mechanism of his plan. The East fails to furnish fragments of sufficient antiquity with which to construct one-half of the New Testament, and gaps so large and important must be filled up from occidental sources, that the attempt, by mere scissor-work upon old MSS. to reconstruct an oriental New Testament of the first four centuries, must be dismissed as impracticable. Lachmann himself, in the preface, takes care to warn his readers, that where the margins are free from the *débris* of various readings there is the feeblest evidence that the clear tracings of the text are original sculpture.

In the criticism of ancient literature, Lachmann's greatest works are his Essays *On the Nibelungen Lied*, and *On Homer*. Many valuable essays on other subjects are hid in the periodicals of the day. His editions of the classics embrace Catullus, Tibullus, Propertius, Terence, Babrius, Avianus, and Caius. His other works are, *The Sagabibliothek of Scandinavian Antiquity* (trans.), 1816; *Essay On the Original form of the Poem of the Nibelungen Calamities*, 1816; *Selection from the Poets of the 13th Century*, 1820; *The Nibelungen Lied* (edited), 1826 and 1840; Hartmann's *Iwain* (ed.), 1827; *The Poems of Walter von der Vogelweide* (ed.), 1827; *Songs of Wolfram von Eschenbach* (ed.), 1833; Hartmann's *Gregor von Stein* (ed.), 1838; Shakspeare's *Sonnets* (trans.), 1820; *Macbeth* (trans.), 1829; Lessing's *Collected Works* (ed.), 1838 to 1840, &c., &c.

LACHRYMATORY, the name applied to small bottles often found in the tombs of the ancients, and so called because supposed to contain the tears of the deceased's friends. These phials are made of glass or earthenware, with a long neck, and the mouth formed, as was thought, to receive the eye-ball. The figure of one or two eyes has sometimes been found impressed upon them. It is more probable, however, that they contain aromatic balsam or such liquids as were used for preserving the dead, as no mention is made of preserving the tears of mourners or friends. On a marble bas-relief in the Capitol, representing the obsequies of Meleager, a female appears approaching the funeral pile, and in her hand is a phial closely resembling the so-called lachrymatories.

LACKER, or LACQUER, is a varnish used on certain works in wood or metal. A hard-wood lacker may be made with 2 lb. shell-lac, to 1 gall. spirit of wine. A pale lacker for brass may be made with $\frac{1}{2}$ lb. of the best pale shell-lac to 1 gall. of spirit, with agitation for six hours without heat. After standing for some time, the clear liquor is to be decanted off. The lacker may be tinted yellow with turmeric, Cape aloes, saffron, or gamboge; for a red tint, arnotto and dragon's-blood are employed. A pale gold-coloured lacker may be made with 8 oz. of shell-lac, 2 oz. of sandarac, 8 oz. of turmeric, 2 oz. of arnotto, and $\frac{1}{2}$ oz. of dragon's-blood to 1 gall. of spirit of wine. Mr A. Ross

uses pyro-acetic ether to dissolve the shell-lac and the gamboge, by which means only the purely resinous portions are taken up, the gummy matters, which are soluble in the water of the spirit of wine, being rejected. The clear liquor is decanted, and is diluted for use with spirit of wine. The green lacker used for bronze works is produced by the addition of turmeric and gamboge.

In lackering brass and other metals it is necessary that they should be chemically clean; and it is usual to raise the articles to nearly the temperature of boiling water, in order that the lacker may flow more readily, and the spirit evaporate quickly, in which case the lacker attaches itself more firmly to the metal, and a more brilliant effect is produced. A *hot-plate*, or *lacquering furnace*, is described under FURNACE. For further details, see VARNISHES; also, 3d vol. of Holtzapffel's *Mechanical Manipulation*. (C. T.)

LA CONDAMINE. See CONDAMINE, *Charles Marie de la*.

LACONIA, or, as it was often called, LACONICA or LACEDÆMON, a country of ancient Greece, was bounded on the N. by Arcadia and Argolis, W. by Messenia and the Messenian Gulf, and S. and E. by the Mediterranean. Its extreme length from the Arcadian frontier to Cape Tænarum is nearly 80 miles; its greatest breadth is about 50 miles. The total area is computed at 1896 square miles. Two great mountain ranges, traversing the whole country from N. to S. parallel to each other, occupy by far the larger portion of the surface. The eastern range, rising in the district of Thyreatis and terminating in Cape Malea, was called Parnon; the western, an offshoot of the great mountain system of Arcadia, and ending in Cape Tænarum or Matalan, was called Taygetus. The former of these is not so much a continuous range as a series of mountains, sometimes isolated and sometimes in groups. The height specially known as Parnon (now called Malevo) touched the confines of Argolis and Arcadia. Its elevation is now ascertained to be 6355 feet. The eastern slope of this range sinks down gradually into the plain, and sends off spurs of hills and gentle rising grounds towards the sea. Its western declivity is much more bold and precipitous. Proceeding southwards, the highest peaks of Parnon are known under the special names of Barbothes, Olympus, Ossa, Thor-nax, and Menelaion. None of these, however, is remarkable either for height or picturesqueness of outline. In the southern half of the chain, the most remarkable group is that of Zarax, of which the highest point is about 3500 feet above the sea. In striking contrast to Parnon is Taygetus, whose splendid masses are as much admired in modern as in ancient times. The classics, both Greek and Roman, abound in allusions to its height, its imposing outline, and the savage grandeur of its scenery. Among modern travellers, Colonel Mure admits, "that, whether from its real height, from the grandeur of its outline, or the abruptness of its rise from the plain, it created in his mind a stronger impression of bulk and loftiness than any mountain he had seen in Greece, or perhaps in any other part of Europe." The highest peak of Taygetus, which reached an elevation of 7902 feet, overhung the city of Sparta. In antiquity it was called Taletum, and was sacred to the sun. Its modern name is St Elias. Five miles S. of it was Evoras, now called Paximadhi, the highest point of the range after Taletum. From this point diverges, in a nearly parallel line, a range of lower hills called Lycobuni, or Wolf's Mountain, which form the southern boundary of the Spartan plain. The southern extremity of the Taygetus, terminating in Cape Tænarum, was the country of the Maniates, who retained their independence after the rest of Greece had been subdued by the Turks. Taygetus was held sacred to Diana, probably from the fact that its great pine-forests harboured immense quantities of game, and were the favourite hunting-ground of the Spartan youth. It was rich in marble,

Laconia.

green porphyry, and iron, all (especially the latter) of excellent quality, and extensively used by the Romans as well as the Greeks. The country enclosed between the great ranges of Parnon and Taygetus was the basin of the Eurotas, now the Basili-potamo. This river, rising on the frontier of Arcadia, flows in a nearly due south course into the Laconic Gulf, opposite the island of Cythera. The upper part of its course is through a deep and narrow valley, which, a little way below the capital, expands into what was known as the Spartan plain. At Cœnoe the valley again contracts, but farther down it widens out into the maritime plain, or plain of Helos (as it was called, from the town of Helos on the shore), and escapes through marshes and sandbanks into the sea. (See EURO-TAS.) The general aspect of Laconia was well described by Euripides, who called it "hollow, begirt with mountains, rugged, and difficult of access to an enemy." There were, in fact, only two ways (both of them very difficult) by which Laconia could be invaded. One of these led from Southern Arcadia, by Stenyclarus, into the upper valley of the Eurotas. The other lay through a pass of Parnon formed by the valley of the small river Cœnus. Both of these passes debouched upon the Spartan plain close to the capital. On the west the great mass of Taygetus presented an insurmountable rampart against a foe. The sea-board was devoid of harbours, and the navigation of the Laconian Gulf was so difficult that no ships could approach the shore. The entrance to the gulf was guarded, moreover, by the island of Cythera, and by the naval station of Gythium on the opposite coast. The soil of Laconia cannot vie with the rich lands of the Messenian plain. Euripides describes it as "possessing much arable land, but difficult to work." This account agrees with that of Colonel Leake, who says that the soil is in general a poor mixture of white clay and stones, difficult to plough, and better suited to olives than corn. The olives of the Spartan plain are at this day preferred to those of Athens; while the silk grown there is the best in Greece. The climate, except on the sea-coast, where the swamps engender the malaria, is excellent, and the inhabitants are taller, healthier, and stronger than any of the other Greeks. Though there are no traces of any volcanic action in the country, it has suffered severely at different times from earthquakes. The most terrible of these was that of B.C. 464, in which enormous masses of rock were rolled down from the top of Taygetus. The city of Sparta was laid in ruins, five houses only remaining uninjured, and more than twenty thousand citizens were killed.

Laconia, which at one time, according to Strabo, contained a hundred cities, had in his day no more than thirty, and of these few but the capital were of any importance. In the Spartan plain the most prominent besides Sparta were *Amyclæ* and *Pharis*, both on rising grounds near the Eurotas, and not far from each other. The most ancient of these was Amyclæ, the old residence of the Achæan kings, and memorable for its numerous and splendid temples. One of these, that of Apollo, was noted as the most sumptuous building in Laconia. *Messapeæ*, *Bryseæ*, and *Harpheia*, were mere villages. In the upper valley of the Eurotas were *Pellana*, the frontier fortress, *Belemina*, *Tripolis*, *Ægys*, which latter, with its territory, belonged at one time to Arcadia, but at an early period was incorporated with Laconia, and *Sellasia*, a fortified town commanding the valley of the Cœnus. In Southern Laconia, besides Gythium, the naval arsenal of the Spartans, were *Croceæ*, with famous quarries of marble and porphyry, *Helos* (see HELOS), *Asopus* or *Cyparissia*, *Nymphæum*, *Sida*, and *Epidaurus Limeræ*. The most important of these will be found described under their respective heads. Few of them were other than mere villages.

The original inhabitants of Laconia are said to have been the Leleges, whose first king, Lelex, was succeeded at his death by his son Myles, and he in turn by his son Eurotas,

who gave his name to the river that flowed through the Spartan plain. His daughter Sparta, married Lacedæmon son of Jupiter and Taygeta, and the dynasty founded by them kept the throne till a short time before the Trojan War, when Menelaus, having married Helen, the daughter of Tyndareus, the last monarch of the old line, became king of the country. Tisamenus, the grandson of Menelaus, was reigning at Sparta when the Dorians invaded and conquered the Peloponnese, under their kings Procles and Eurysthenes. The conquerors divided Laconia into six districts, to each of which they appointed a chief magistrate with the title of King. It was not, however, till about the middle of the eighth century B.C. that the Spartan Dorians obtained undisputed possession of the whole of Laconia. They had no sooner done so, than they cast a covetous eye on the richer plains of their Messenian kinsmen and neighbours. It was not difficult to pick a quarrel with a people hardly less warlike than themselves. The first Messenian war broke out in B.C. 743, and lasted till B.C. 754; the second, beginning in B.C. 685, and ending in B.C. 668, terminated in the complete subjugation of Messenia. The conquered country was absorbed in that of the victors, and its name does not again occur in history till its independence was restored by Epaminondas. The frontier lands of Laconia on the north, comprising the upper valleys of the Eurotas and Cœnus, and the districts of Sciritis, Belemnatis, &c., originally belonged to Arcadia. They were finally annexed by the Spartans about B.C. 600, who, however, were never able to push their conquests any further in this direction. For the remaining history of Laconia, see GREECE, SPARTA, &c., &c.

LACONICISM is the name given to a short pithy mode of expression, regarded as characteristic of the natives of Laconia. We have many historical instances of its use among that people amounting even to affectation. Thus, when Philip of Macedon wrote that, "If he entered their territory, he would destroy all before him with fire and sword," they simply returned for answer,—"If." The famous letter of Cæsar to the senate, "*Veni, vidi, vici*," is an example of the laconic style, which is still preserved in armorial devices, monumental inscriptions, proverbs, &c., &c.

LACTANTIUS, LUCIUS CÆLIUS FIRMIANUS, was, according to the common account, born at Firmium in Italy about the middle of the third century. After he had studied at Sicca Venerea in Africa, under Arnobius the celebrated teacher of rhetoric, at the request of Diocletian he settled, about A.D. 301, at Nicomedia, in Bithynia, and there opened a school for Latin eloquence. Being, however, unsuccessful as a teacher, he abandoned his favourite study of rhetoric, and became author by profession. His conversion to Christianity about this period was probably the chief cause of the extreme poverty under which he struggled, even after the accession of Constantine, when he was summoned to Gaul to act as tutor to Crispus, the eldest son of the Emperor. Lactantius died at Treves about A.D. 325.

The theological works of Lactantius, still extant, are,—*Divinarum Institutionum libri vii.*, containing an exposure of the error and absurdity of pagan idolatry and philosophy, and a vindication of the truth and purity of Christianity; *De Ira Dei*, written against the Epicureans in support of the doctrine of rewards and punishments; *De Opificio Dei*; and *De Mortibus Persecutorum*.

As a Latin prose-writer, Lactantius is second only to the writers of the Augustan age; and of all who have imitated the graceful and energetic eloquence of Cicero he has been the most successful. In theology he is more rhetorical than logical, fonder of the dogmas of heathen philosophy than of the doctrines of the gospel, and therefore very unsafe as a teacher of Christianity.

LACTHO, a province of India beyond the Ganges, tributary to the sovereign of Cochin-China. It is bounded

Laconicism
||
Lactho.

Ladak. S. by Lars, N. and E. by Tungquin, and W. by China. This territory has been but imperfectly explored by Europeans; but it is described by the Tungquinese as mountainous, rocky, covered with jungle, and destitute of navigable rivers, with a singularly pestilential air, and water very unwholesome, though the climate is cooler than that of Tungquin. The interior is inhabited by numerous tribes, little better than savage, governed by hereditary chiefs, and perpetually at war with each other. Salt is imported into this country from Tungquin; also salt-fish, oil, and some silk stuffs for the chiefs. The exports to Tungquin are chiefly buffaloes and cotton. Shells and cowries form the medium of exchange. According to information derived from the Tungquinese, this province contains many extraordinary natural caverns, which appear to have served the natives as temples. One cavern is described as a mile across, perforating a mountain, and another as being entered under ground in a boat.

LADAK, or MIDDLE TIBET, a very elevated and rugged country of central Asia, N. of the Punjab, and lying between N. Lat. 32. 25. and 35. 10., and E. Long. 75. 30. and 79. 10. It is bounded N. by the Karakoram Mountains, which separate it from the Chinese territory of Kotan, E. and S.E. by the Chinese districts of Rudok and Chumurti; on the S. it includes the districts of Lahul and Spiti, now attached to British India; and on the W. it is separated from Kashmir by the western Himalaya chain, and from Balti by an imaginary line drawn from the mouth of the Dras to the sources of the Nubra. Its greatest length from N.W. to S.E. is 240 miles, and its greatest breadth 190; but, from the irregularity of its outline, its entire area is little more than 30,000 square miles. The territory of Ladak is one of the most elevated regions of the globe. The great valley of the Indus traverses the country through its entire length from S.E. to N.W. On each side of the valley are several parallel ranges of mountains, some of which are calculated to rise to the enormous height of above 29,000 feet. These determine the course of the rivers, and furnish a system of divisions for the country. These divisions are,—1, at Nubra, on the Shayok; 2, Ladak Proper, on the Indus; 3, Zanskar, on the Zaskar River; 4, Rukchu, along the lakes of Tshomo Riri and Tsho-Kar; 5, Purik, and Suru, and Dras, on the different branches of the Dras River; 6, Spiti, on the Spiti River; and 7, Lahul, on the Chandra and Bhaga, or head waters of the Chenab. The first five are subject to Gholab Singh, and the two last belong to the East India Company.

The following table gives the area and mean elevation of the inhabited parts of the different districts:—

	Area in Square Miles.	Mean Height.
Nubra.....	9216	12,763
Ladak.....	3960	11,500
Zanskar.....	3080	13,154
Rukchu.....	5580	15,634

The great river of Ladak is the Indus. Its principal affluent is the Shayok, which rises in the Karakoram Mountains in N. Lat. 35, E. Long. 78. Its course for about 150 miles is generally in a S.E. direction, when it turns suddenly to the N.W., and continues a W.N.W. course to its junction with the Indus at Keris. Its length is about 400 miles. The Zanskar, a dark and turbulent torrent, falls into the Indus at Nyimo, 25 miles below Lé, after a northerly course of 210 miles. About 25 miles above its mouth it receives the Sum-gal, which has a N.N.W. course of 110 miles. At Moral, 125 miles below Lé, the Indus receives on the left the Dras, which is about 85

miles in length. There are also numerous lakes, the principal of which is Pankong, a long narrow sheet of extremely salt water, not less than 85 miles in length, with an average breadth of 3 miles. The great mountain ranges are generally of primary formation—granite, gneiss, and mica-slate. Lead, copper, and iron ores have been discovered; and gold is found in the sand of several of the rivers. Sulphur, soda, and borax are obtained in certain parts.

The climate of Ladak is characterized by great extremes of heat and cold, and by excessive dryness. In the elevated district of Rukchu it freezes almost every night during summer, but the noon-day sun is several degrees hotter than in most parts of India. The quantity of rain and snow that falls is, owing to the great lack of moisture in the atmosphere, exceedingly small. In the more elevated districts of Rukchu, Nubra, Zanskar, and Ladak Proper, it rains, or rather drizzles, for an hour or two, three or four times in a year. Snow falls much oftener, but not in any quantity, and in Ladak and Rudok it is never more than six inches deep. This aridity of climate renders artificial irrigation necessary in cultivation, and hence the cultivated land is only to be found along the courses of the rivers and streams. The waters of the smaller streams are arrested by dams, and conducted with great skill from field to field, and from terrace to terrace. The grain crops are wheat, barley, and buckwheat. The esculent vegetables are carrots, turnips, onions, cabbages, and radishes. Caraway, mustard, linseed, and tobacco, are cultivated to a small extent. The timber trees are few and unimportant. The most common are poplars and willows, which are planted round every village. Less common are the pencil cedar, the *Elaeagnus Moorcroftii*, and a kind of tamarisk. The fruit trees are the apple, apricot, walnut, mulberry, and vine. The rhubarb of medicine grows in great profusion, and of the finest quality.

The wild animals are numerous. The elevated plains of the Indus, and the lofty table-lands of Rukchu, abound with the horse, marmot, and hare, while the snowy mountains and rugged glens teem with many varieties of the wild goat, sheep, and deer. Other wild animals are the leopard, bear, wolf, fox, ounce, lynx, jackal, and weasel. The domestic quadrupeds are horses, yaks, cows, asses, goats, and dogs. The goat furnishes the fine wool of which the fine Kashmir shawls are made. Birds are not numerous. The *chakor* is a bird resembling a partridge, but of the size of a guinea hen. The eagle, kite, and raven, are common, as are also smaller birds, as the sparrow, linnnet, redbreast, and lark. Waterfowl abound on the lakes. The rivers teem with fish, which the superstition of the natives does not allow them to molest.

The manufactures of Ladak are few, rude, and unimportant, being chiefly coarse woollens for home consumption. The country furnishes few articles of trade, almost the only exports being wool, borax, sulphur, and dried fruits. The transit trade, however, is very large, owing to its position between Kashmir and India on the S. and S.W., and the Chinese provinces of Yarkand, Kotan, and Kashgar, on the N. and N.E.

Ladak is inhabited by a peculiar race of people, considered in features and language to bear a considerable resemblance to the Chinese. The population is estimated at 168,000.

The professed religion is Lamaism. The deity is worshipped in the character of a trinity, but adoration is paid to a great number of inferior beings, represented by a variety of curious idols. Among the social institutions of the country the most remarkable is the system of polygamy that prevails among the poorer classes. A family of brothers has only one wife in common, who will thus not unfrequently have three or four husbands. The system, however, is strictly confined to brothers. The

rich, as in all eastern countries, have generally several wives. Previous to the conquest of the country by the Sikhs, the government was a simple despotism, administered by the Rajah, according to the direction of the influential Lamas. Gholab Singh invaded the country in 1835, and annexed it to the dominions of his master Runjeet Singh. He now retains the acquisition as a portion of the principality which was assigned to him by the British after the conquest of the Punjab. (See Cunningham's *Ladak*.)

LADOGA, a lake in Russia, the largest in Europe, lies between the governments of Viborg on the N. and W., Petersburg on the S., and Olonetz on the E. Its greatest length is about 130 miles, breadth above 70. The coast is generally low, much indented, and abounding in dangerous reefs. The depth in some places reaches about 150 fathoms, in others it is insufficient for safe navigation. Storms are frequent, and the influx of many considerable streams produces strong currents. The chief rivers entering the lake are the Swir (or Sveer) from the E., bearing the waters of Lake Onega; the Volkhoff on the S.; those of Lake Ilmen and the Saima on the N., draining the reticulation of waters of that name. It empties itself on the S.W., by the Neva, into the Gulf of Finland. There are numerous islands scattered along the north-western shore, several of them inhabited. The principal towns on the coast are Kexholm, Schlusselfburg, and Novaia Ladoga. A canal executed in the reign of Peter the Great connects the two latter, forming a direct communication between the Neva and Volkhoff.

LADRONE, or MARIANNE ISLANDS (so called respectively from the thievish habits of the natives, and in honour of Queen Mary Anne of Spain), a group in the N. Pacific Ocean, between Lat. 13. and 21., Long. 144 and 146. They are about twenty in number, of volcanic origin, irregular and picturesque in outline, and clothed with luxuriant vegetation. The intervening straits abound in shoals and currents, and there are few good harbours. The heat of the climate is somewhat tempered by the trade-winds. Among the vegetable products are sugar, rice, Indian corn, tobacco, cotton, indigo, &c. Of wild animals, the most numerous are swine, sometimes of large size; cattle, horses, asses, mules, and llamas, have been introduced by the Spaniards. The principal island is Guajhan, or St John, the most southerly of the group. It is about 80 miles in circumference, and has a good fortified harbour, some miles to the S. of St Ygnacio de Agaña, the seat of government. The aboriginal inhabitants, an active and athletic race, have gradually given place to a mixed population, descended of colonists from Mexico and the Philippine Isles. This group was discovered in 1521 by Magellan; but no settlement was made in them for about 150 years, when the widow of Philip IV. sent out a body of missionaries to convert the natives. They were visited in 1742 by Anson, who spent some time on the island of Tinian, where he discovered architectural remains, indicating a considerable progress in the arts of civilization. (See POLYNESIA.)

There are two other small island groups of this name, the one on the coast of China, at the mouth of the bay of Canton, a great stronghold of pirates, the other off the coast of Guatemala.

LADY, a word of Saxon origin, generally supposed to signify loaf-giver, the first part of the word *klaf*; a loaf, being preserved in the Saxon *klaford*, a lord. In ancient times it was the practice of the *lady* of the manor to distribute bread to the poor with her own hands at stated times. Tooke, however, derives the term from the verb *hlifian*, to raise, and thus regards it as denoting a person raised to equality with her lord. Both derivations are honourable to our Saxon ancestors. As a title it belongs to the daughters of all peers above the rank of a viscount, but is extended by courtesy to the wives of knights.

LADY-Day an immovable feast celebrated on the 25th of March, or the annunciation of the Holy Virgin.

LÆLIUS SAPIENS, C., was the son of C. Lælius Nepos, and distinguished by his love of philosophy in an age when war still continued to be regarded as the only employment worthy of a Roman. He was the pupil of Diogenes the Stoic, and afterwards of Panætius. (Cic. *Fin.* ii. 8.) He was the intimate friend and companion of Scipio Africanus the younger, and attended him in his expedition into Africa when he took Carthage, B. C. 146. (Appian. *Pun.* 126.) He was then employed as prætor in Lusitania, where he obtained considerable advantages over Viriathus. (Cic. *Off.* ii. 11.) He was elected consul along with Servilius Cæpio (B. C. 140); but notwithstanding the able manner in which he discharged the duties of the office, he did not succeed in being re-elected, a circumstance which Cicero laments in most feeling language. (*Tusc.* v. 19.) Lælius spent much of his time in the country, devoting himself partly to rural occupations, and partly to study. The mildness of his disposition, and the equanimity of his temper, are noticed by Horace, when he speaks of *mitis sapientia Lælii* (*Sat.* ii. 1). He was the intimate friend of Pacuvius and Terence; and it is said that he and Scipio assisted the latter in the composition of some of his plays. It was no doubt his friendship with Scipio that induced Cicero to place the name of Lælius at the head of his beautiful essay *On Friendship*. The interlocutors are Lælius himself, and his two sons-in-law, C. Fannius and Q. Mucius Scævola.

LAENNEC, RÉNÉ THÉOPHILE HYACINTHE, the discoverer of mediate auscultation, was born at Quimper, in Lower Brittany, February 17, 1781. After going through the usual course at the chief school in the department of the Loire Inférieure, he began the study of medicine under the care of his paternal uncle, a distinguished physician at Nantes. In 1799 he acted for a short time as assistant surgeon in the military hospitals then established in that city. Removing to Paris in the following year, he attached himself to the clinical school in the great hospital of La Charité, at that time under the direction of the celebrated Corvisart. Among his fellow-students were Double and Bayle. Even thus early he began to make himself known by his occasional essays and pamphlets, and by his contributions to the *Journal de Médecine*. He graduated in 1804. In the same year he became editor of the *Journal de Médecine*, and continued to enrich its pages with many learned and original papers, chiefly on morbid pathology, till bad health compelled him to resign his office. His intention at this time was to have published a complete work of morbid anatomy, on which he had lectured publicly for some sessions at Paris. He did not live to carry out his plan; but portions of the work were published as separate articles in the *Dictionnaire des Sciences Médicales*. Meanwhile his practice was keeping pace with his widening fame; and in 1816 he was appointed chief physician to the Hôpital Necker, the duties of which he undertook with his usual zeal and activity, and in which he was speedily rewarded for all his labours by his great discovery. For two years after the idea first dawned upon him he devoted himself with astonishing perseverance to perfecting the new system of diagnosis which he founded on it. By June in 1818 he had advanced so far as to read a memoir before the Academy of Sciences, containing the outline of his method, and in the September of the following year he published his remarkable work, under the title of *De l'Auscultation Médiate, ou Traité du diagnostic des Maladies des Poumons et du Cœur, fondé principalement sur ce nouveau moyen d'exploration*. The profession, especially the elder members of it, received the work with distrust; and but for the admirable descriptions of diseases contained in it, and giving it a value independent altogether of the system of diagnostics, his discovery might have fallen into temporary oblivion. Fortun-

ately, however, Laennec had many zealous friends among his own students, who diffused a knowledge of the new method, not only in France, but in other countries of Europe.

Meanwhile, the labour involved both in observing and redacting the results of his observations had very nearly proved fatal to Laennec. He was physically very small and puny, and his intense application had now broken his health, both of mind and body. Relinquishing his valuable practice, and all his appointments, he retired to a country-house of his own near his birth-place. He was not long of recovering his health and spirits, but he was very unwilling to return to Paris. However, in the autumn of 1821 he did return, and besides renewing his duties at the Necker Hospital, became private physician to the Duchess of Berri, and professor of medicine in the College of France. When the college was reconstituted in the following year, he was appointed to the chair of clinical medicine. His health again began to give way, and the art which he had himself discovered warned him that he was falling a prey to pulmonary consumption. After seeing through the press the second edition of his great work, he again retired to his native town. At first he seemed to benefit by the change; but the disease had gone too far to be arrested, and he died August 13, 1826, in the forty-fifth year of his age.

Though it was as the inventor of the stethoscope that Laennec became known in his own day, and wished to be known by posterity, that invention is not his only or his greatest title to posthumous fame. Its invention was indirectly invaluable, as it led Laennec to make diseases of the chest his special study. These pathological inquiries of his yielded results more beneficial to mankind than any discovery in modern medicine, except vaccination. Diseases of the chest, which before Laennec's time had been very little understood, are now diagnosed by mediate or immediate auscultation with an accuracy as faultless as those which show themselves on the surface of the skin. Though he had a large and lucrative practice, Laennec does not seem to have been highly esteemed as a physician, and the therapeutical portions of his work are the least satisfactory. It was as a pathologist that he was distinguished above most of his contemporaries.

His great work has been translated into most of the European tongues. The English translation, by Dr John Forbes of Chichester, is preceded by a life of Laennec, compiled from two biographies by Kergaradec and Bayle.

LÆSTRYGOÑES, a fabulous race of giants, whose name is often found in the Greek myths. They are first mentioned in the *Odyssey*, where they are described as a pastoral people, governed by a king called Lamus. Homer assigns them no site, but tradition placed them in the island of Sicily. Their exact locality in that island varied with the fancy of the writer. The current story is that they dwelt near Leontini, and that from this circumstance the rich plains adjoining that city came to be called the Campi Læstrygonii. The version most popular at Rome was that they lived on the Latian coast around Formiæ, which was represented as their capital.

LAFAYETTE, GILBERT MOTTIER, was born at Chavagnac, in Auvergne, Sept. 6, 1757, and educated at the Parisian College of Louis le Grand. At the age of 20, and only three years after his marriage with the granddaughter of the Duc de Noailles, he left France to assist the Americans in the war of independence; and fought as a volunteer at Brandywine. Shortly after, equipping 2000 infantry at his own expense, he signalled himself at the capture of New York. On the close of the war he returned to France; in 1787 became a member of the Notables; and, during the revolution of 1789 sat in the National Assembly, where he proposed the famous "Declaration of Rights." Having been appointed commander-in-chief of the National Guards, he was present at the attack upon Ver-

Lafayette
||
Lagosta.

sailles, and saved the lives of the royal family. In 1790, after organizing the Club of Feuillons, and defending the king from popular fury, he retired to his estates. In the war of the coalition, in 1792, he was one of the three major-generals in command; but losing his popularity on account of his moderate opinions, he was compelled to flee from France, and fell into the hands of the Austrians, who imprisoned him at Olmutz. He was liberated along with the other prisoners in 1797. During the ascendancy of Bonaparte, Lafayette declined all public offices until the emperor's return from Elba, when he accepted a seat in the House of Representatives. This body, at his instigation, attempted to continue sitting after the disaster at Waterloo, but was dissolved by military force, and Lafayette returned to his retirement. He visited the United States in 1824. In 1830 he commanded the National Guards, and was instrumental in raising Louis Philippe to the throne. He died in 1834.

LAFAYETTE, a town of the United States of North America, capital of Tippencanoe county, Indiana, on the left bank of the Wabash River, 66 miles N.W. of Indianapolis, and 123 miles S.E. of Chicago. It stands on a rising ground, which slopes gradually to the water side, and affords extensive views of the surrounding country. Its chief trade consists in cast-iron, paper, and pork. The prosperity of Lafayette is greatly owing to its easy communication with the Mississippi valley and the lakes of Michigan and Erie. The Wabash and Erie Canal passes through the town, while by rail it is connected with Indianapolis, Lake Michigan, &c. Pop. (1854) about 8000.

LAGONEGRO, the capital of a district of the same name, in the province of Basilicata, kingdom of Naples, is situate at the head of a narrow glen, everhung by the heights of *Monte Cocuzzo*, *Monte del Papa*, and *Monte Sirino*. Close beside the town is a battle-field where Regnier, one of Joseph Bonaparte's generals, defeated a detachment of the Neapolitans. Pop. 5000.

LAGO MAGGIORE, or **LAKE OF LOCARNO** (*Lacus Verbanus*), a lake in the north of Italy, touching Lombardy, Piedmont, and the Swiss canton of Ticino. Average breadth 2 miles, length 40 miles. Its basin in some places is of the depth of 438 fathoms, and is fed by the Toce on the W., the Ticino on the N.E., and the Fresa on the E. The chief islands are the Borromean. Merchant-vessels engaged in the timber trade traverse its waters; and steam-packets ply regularly between Magadino and Sesto Calende. The lake abounds in fish, and its shores in fine marble quarries.

LAGOON (*Lacuna*, a ditch), the name given to numerous creeks extending along the Adriatic in the government of Venice. In some places they are deep, but generally so shallow as to cause noxious and offensive exhalations. The lagoons are studded with islets, on sixty of which Venice is built. See **VENICE**.

LAGOS, a seaport-town of Portugal, province of Algarve, about 20 miles E. of Cape St Vincent. Pop. about 7000, mostly engaged in the tunny and sardine fishery. In the Bay of Lagos, August 18, 1759, a signal victory was won by Admiral Boscawen over the French Toulon fleet under De la Clue.

LAGOS, a country of Western Africa, between Dahomey and Benin. The capital, Lagos, a place of considerable population, was long one of the principal ports of the slave-trade. In November 1851, a small British force attacking the place was repulsed with loss; about a month later a better organized assault resulted in the reduction of the town and the capture of 57 guns. A treaty securing the abolition of the slave-trade, and other important benefits, was concluded soon after.

LAGOSTA (the ancient *Lastobon* or *Ladestris*), an island in the Adriatic, off the coast of Dalmatia, belonging

Lagrange. to Austria, 63 miles W.N.W. from Ragusa. Its length from E. to W. is 6 miles, and its breadth 3 miles. Its coast is guarded by steep cliffs, indented by several well-sheltered creeks, while its interior is very mountainous. It is surrounded by a number of smaller islands, the principal of which are, the group called the Lagostini on the E., and the Island of Marciara on the W. Its north side is the village of Lagosta. The soil produces wine and oil, but only for home consumption. Pop. 1200.

LAGRANGE, JOSEPH LOUIS, a mathematician and astronomer of the first rank, born at Turin on the 25th of January 1736, was the son of Joseph Louis Lagrange, treasurer at war, and Maria Theresa Gros, only daughter of a rich physician at Cambiano.

He was the eldest of eleven children, but nine of them died young. His family was of French extraction on both sides; and his French biographers have dwelt with pleasure on the minute particulars of their emigration, in order the more fully to authenticate their own claim to the honour of calling him their natural as well as adopted countryman. It was his great-grandfather that first settled at Turin, in the service of Emmanuel II., who married him to a Roman lady of the family of Conti. They had at one time acquired considerable affluence, but his father had ruined himself by his expenses and speculations; and Lagrange used frequently to observe, that he owed his own success in life to his father's misfortunes, since, if he had been rich, he should never have applied to the mathematics as a profession. The classics were at first his favourite study at the college of Turin; he began his scientific education with reading the works of the ancient geometers, and at first preferred their methods of investigation to the more modern analysis; but being convinced, as it is said, by a paper of Halley in the *Philosophical Transactions*, of the superiority of the algebraical mode of representation, he applied with redoubled ardour, at the age of seventeen, to the study of the later improvements in the methods of investigation; and in his subsequent works he abandoned, wherever it was practicable, all geometrical considerations, and seems to have valued himself on having produced a complete system of mechanics, free from the incumbrance of any diagram whatever. When he was only nineteen, he was made professor of geometry in the Royal School of Artillery, but not before he had exhibited, in his first publication, a specimen of the improvements which he was throughout his life to contribute to the mathematical sciences.

The friendships which he formed with his pupils, most of whom were his seniors, led to the establishment of a society which afterwards received the sanction of the royal authority, and to the publication of their memoirs, in which Lagrange not only took the most active part as a contributor of original papers, but also by materially assisting in the demonstrations of Foncenex, and promoting the researches of Cigna and Saluces. Foncenex was soon rewarded by being placed at the head of the maritime establishment which the king was then forming; and Lagrange received in a short time a still more flattering remuneration, in the panegyrics which were liberally bestowed on him by his great rivals, Euler and D'Alembert; the former procured him, in 1759, the compliment of being made a foreign member of the Academy of Berlin, having become well acquainted with his merits by an epistolary intercourse, which began as early as the year 1754, when Lagrange communicated to him his first ideas of the solution of isoperimetrical problems, which Euler had the delicacy to allow him time to complete, before the publication of his own further researches on the subject.

In 1764 he obtained a prize from the Academy of Sciences at Paris, for a memoir on the difficult subject of the libration of the moon, having treated it by an original method, derived from the principle of virtual velocities, which

he afterwards applied so successfully to other branches of mechanics. Soon after this time he found an agreeable relief from the monotony and retirement of his life at Turin, in accompanying his friend the Marquis Caraccioli, who was appointed ambassador at the court of London, as far as Paris, where he had the delight of becoming personally acquainted with a number of the most distinguished mathematicians of the age, who were capable of appreciating his merits, especially with Clairaut, D'Alembert, Condorcet, Fontaine, Nollet, and the Abbé Marie; but indisposition prevented his going on to England, as he had intended, and he returned to Turin after a short stay in France. A second prize, on the subject of the satellites of Jupiter, was awarded him in 1766; and the same tribute was again paid to his merit on three subsequent occasions. It was in this year that he was invited to Berlin, as a successor to Euler in the place of mathematical director of the academy, Euler having been induced to remove to Petersburg, by a better prospect of providing for his numerous family. The appointment of president of the academy, held by Maupertuis, had been given but in part to Euler; the whole was offered to D'Alembert, who declined it; but both he and Euler united in recommending Lagrange as the fittest person for the situation. It was, however, with some difficulty that he obtained his sovereign's leave to quit Turin; and the favour was at last granted to him partly in pique, on account of the terms of the invitation, which expressed the desire of the "greatest king in Europe" to have the greatest mathematician at his court.

At Berlin he pursued his career of study in tranquillity and without interruption, upon a competent income of about L.300 a-year, with the advantage of such demonstrations of the royal protection as were still more important than income to his rank in society. The king seems to have preferred him to Euler, as more tolerant in his opinions, though by no means joining in all the innovations of the day, and rather avoiding every discussion relating to them, as well as any great familiarity with his patron. He was made, in 1772, one of the eight foreign associates of the Parisian academy. He is said to have married more for the sake of complying with the universal custom of his friends and colleagues at Berlin, than for any desire of female society; and he invited a relation of his own from Turin, who became his first wife; but she was soon after carried off by a lingering disease. He was about this time very closely employed on his greatest and best work, the *Mécanique Analytique*; but it was with some difficulty that the Abbé Marie found a bookseller at Paris, who agreed to undertake its publication, and only upon condition of engaging himself to divide the loss, in case of failure in the sale. He also procured the valuable assistance of Mr Legendre as a corrector of the press.

Upon the death of Frederic in 1786, Lagrange no longer felt the same interest in remaining at Berlin, though he was not treated by the new court with any thing like disrespect. While the ministers of Naples, Sardinia, and Tuscany, were making him offers on behalf of their respective sovereigns, Mirabeau persuaded the French ambassador at Berlin to recommend M. de Vergennes to invite him to Paris; but it was in reality through M. de Breteuil's interest, and at the suggestion of the Abbé Marie, that he was ultimately induced to settle there in 1787, having received a grant of an income equal to that which he had enjoyed at Berlin, under the name of a veteran pensioner of the academy, with a vote in its deliberations. He was kindly received by Marie Antoinette, on account of his connection with Germany; and, until the Revolution, he had the use of apartments in the Louvre.

It was at this period of his life, when his success had been the most gratifying, and his fame had become per-

Lagrange. fectly established, that he appeared to suffer under a degree of melancholy or apathy which was absolutely morbid. He confessed that all his enthusiasm was extinguished, and that he no longer felt the least relish for mathematical researches. He had not even the curiosity for two years to open the printed volume of his *Mechanics*, which he had never seen except in manuscript. It is a consolation to think that this annihilation of his energies was only partial and temporary. He amused himself in the meantime with metaphysics, "with the history of religions" and of languages, and with medical and botanical, and especially chemical studies; and the alarms and agitations of the Revolution, which soon followed, instead of overwhelming his broken spirit, seem to have roused his dormant powers, and to have revived his satisfied ambition, exciting him to new labours and new triumphs.

In 1791 his name appeared on the list of the foreign members of the Royal Society of London. Mr Maurice has asserted, that all the scientific bodies of Europe, *except* the Royal Society, received him with open arms; if the remark was intended as a censure of that society, it is right that its injustice should not pass unnoticed.

Notwithstanding the public embarrassments which attended the Revolution, Lagrange's pension was confirmed by the National Assembly, upon the proposition of M. Dusejour, in the most flattering manner; and when the depreciation of the currency materially reduced its amount, he received a partial indemnification, by being appointed a member of a committee for examining useful inventions, and afterwards a director of the mint, in conjunction with Berthollet and Monge; but this employment he found too laborious, and resigned it six months afterwards. He was greatly interested at this period in the establishment of the new system of weights and measures; he was so violently bent on *decimation*, that he scarcely forgave Borda for having made a measure of a quarter of a metre; and he thought so little of the advantage of integral subdivisions, that he sometimes declared he should have preferred the number eleven to twelve, for the very reason that it admitted no subdivision at all, and caused all lesser quantities to be expressed in units comparable to each other only. This opinion seems, however, to have been advanced rather as an exaggerated objection to the introduction of twelve, which was suggested by some more ardent innovators, than as seriously attributing a real advantage to the employment of a prime number.

When the academics were suppressed, the Jacobins purified the commission of weights and measures by striking out the names of many of its most distinguished members, while they retained that of Lagrange, probably because he was of no political party whatever, and had always been particularly cautious in expressing his sentiments of the events of the day. In October 1793, however, a decree was passed, which ordered all persons not born in France to leave the country. Guyton, who was a member of the Committee of Public Safety, advised him to claim an exemption from its operation, by a requisition of that committee, on the pretext of his being employed in preparing a report on Dr Hutton's *Treatise on Gunnery*; and he actually received an injunction from the committee, requiring his stay, "in order to complete the calculations which he had undertaken respecting the theory of projectiles." He was attempting to reunite the experiments of Dr Hutton with a more correct theory than had before been applied to them; but he published nothing of importance on the subject. After the murder of Bailly and Lavoisier, he had agreed to return to Berlin, and to resume his former situation there; and he was on the point of obtaining a passport, and even a public mission from Hérault de Sechelles. But the establishment, first of the *Normal School*, in which he was a professor, and then of the *Ecole Polytechnique*,

induced him to remain at Paris, and again directed his activity into its ancient channels. In the Normal Schools the masters were mixed with their pupils, in order that the facilities of conversation might produce a development of the subjects discussed in the most elementary manner that was possible; but the conversation was by no means supported in the form of incessant questions and answers; Lagrange's explanations were often interrupted by moments of silence, in which his inventive faculties were deeply engaged in reflection, and the whole of his powers were concentrated on a new train of ideas. It was amidst these discussions that the *Theory of Analytical Functions* originated, a work certainly not destitute of the marks of great mathematical talent, but which, when considered as a substitute for the method of fluxions and its kindred doctrines, resembles very much the suggested introduction of an undecimal in preference to a duodecimal scale of notation, with which the author had before amused himself.

Upon the re-establishment of the Institute, Lagrange was made one of the original members; and he was the first on the list of the Board of Longitude, which was then first instituted at Paris. He received about this time a compliment highly grateful both to his love of fame and to his filial affection, in the person of his father, then past ninety, and continuing to reside at Turin. By the direction of Talleyrand, who was minister for foreign affairs, the commissary of the directory of Piedmont, attended by the generals of the French army, and several other persons of distinction, went in procession to congratulate this venerable person on the merits of his son, whom he had not seen for more than thirty years, whom they declared "to have done honour to mankind by the brilliancy of his genius, and whom Piedmont was proud to have produced, and France to possess as a citizen." The old man lived to the age of ninety-five, and was sincerely regretted by his son.

Under the consular and imperial government, Lagrange was made a senator, a grand officer of the legion of honour, a count of the empire, and a knight grand cross of the order of reunion, in addition to the personal marks of friendship and intimacy which Bonaparte habitually conferred upon him at the meetings of the Institute, and on other occasions.

He applied with so much zeal to the republication of the first part of his *Mechanics* in 1811, and of his *Analytical Functions* in 1813, that his health is supposed to have suffered from the fatigue; which, in conjunction with a predisposition, not uncommon in advanced life, may very possibly have been the immediate cause of a fit that attacked him in the beginning of the latter year. In the month of March he was subject to frequent returns of fainting, accompanied by some fever. On the 8th of April he had a last conversation with Lacépède, Monge, and Chaptal, all the parties being aware that it was to be the last. He felt the approach of death, but he declared that it was in that form neither painful nor even disagreeable. He spoke with proper gratitude of the favours he had received from Bonaparte, who afterwards provided very liberally for his widow and his brother. The interview lasted more than two hours; and though his memory often failed him with respect to names and dates, yet his language was correct and energetic. He survived this effort only two days, and died on the morning of the 10th April 1813. He was buried at the Pantheon, or the church of St Gèneviève, and his friends Lacépède and Laplace paid the last honours to his memory in a funeral oration.

Lagrange was habitually of delicate health, and extremely temperate in his diet and mode of life, limiting his food almost entirely to vegetables, and taking his exercise very punctually in the open air. At the age of fifty-six he mar-

Lagrange married the young and handsome Madlle. Lemonnier, who appears to have felt the splendour of his celebrity and the goodness of his heart, as affording much more than a compensation for the great inequality of their ages. He was deeply sensible of her affectionate attachment, which he considered as the greatest happiness of his life, and on account of which alone he regretted its termination. He had no children, and he was perfectly contented to be without them. In the midst of the most brilliant societies he was generally absorbed in his own reflections; and especially when there was music, in which he delighted, not so much for any exquisite pleasure that he received from it, as because, after the first three or four bars, it regularly lulled him into a train of abstract thought, and he heard no more of the performance, except as a sort of accompaniment assisting the march of his most difficult investigations, which he thus pursued with comfort and convenience. He was less fond of the theatre, from which he often returned without knowing what piece had been represented. His manner in conversation was gentle and timid; he was more in the habit of interrogating than of giving his opinion, and his favourite expression was, "I don't know" . . . He was not, however, easily induced to change his sentiments when they were once fixed, having generally adopted them upon mature consideration. As a writer, whenever any controversy occurred, he was always calm in defending himself, and respectful in speaking of his antagonists. Notwithstanding that his person was striking and characteristic, as well as pleasing, he would never consent to have his portrait painted, thinking it unworthy of a man of intellectual excellence to wish to be remembered for the external form of his features. But a sketch of him was once obtained by stealth at a sitting of the Institute, and a mask of his face was taken after his death. His works bear witness, that for fifty-four years he occupied either the first or very nearly the first place among all the mathematicians of his age and of all ages. "Of all the inventors," says Laplace, "who have the most contributed to the advancement of human knowledge, Newton and Lagrange appear to me to have possessed in the highest degree that happy tact, which enabled them to distinguish general principles among a multitude of objects enveloping them, and which is the true characteristic of scientific genius. This tact, in Lagrange, was united with a singular elegance in the method of explaining the foundations of the most abstract truths of analysis." Lagrange was a great admirer of Euler, who perhaps excelled him in the adroitness with which he employed the most refined artifices of calculation, though his views and methods were less original and less powerful. D'Alembert was highly esteemed by Lagrange, as a man of abundant ingenuity and talent, though less accurate in his conclusions, and in his modes of reasoning, than either Euler or Newton. Newton he envied almost as much as he admired, for having found a system of the world in existence, and the principles of its modification not yet understood; but when it is remembered that the places of the heavenly bodies are now ascertained to seconds more nearly than they were to minutes during the life of Newton, it cannot be thought that Newton left too little for his successors to accomplish.

1. His first publication, at the age of eighteen, was a Letter to C. J. Fagnano, 23d June 1754. It contains series for fluxions and fluents of different orders, somewhat resembling the binomial theorem of Newton.

2. The series of his papers in the *Miscellanies of Turin* is continued from 1759 to 1786. The first is on Maxima and Minima, *Misc. Taur.* i., 1759, p. 18. It is founded on the principles laid down by MacLaurin, and is illustrated by the case of the successive transmission of an impulse through a series of elastic bodies, comprehending the combination of a number of variable quantities. 3. On an Equation of Finite Differences, and on the Theory of recurring Series, p. 33. The equation is resolved by an exponential integral, and the sum of the series is obtained by the principles of fluxions; the same mode

of calculation is also applied to the laws of chance. 4. Researches on the Nature and Propagation of Sound: end of the volume. The investigations of Taylor and of Newton were true and correct as particular solutions only of the problems of chords and of undulations, though mistaken for general solutions, and as such successfully combated by Cramer, whose reasoning, though certainly too far extended, is here approved by Lagrange. Daniel Bernoulli very successfully defended them both, not only as particular solutions, but as capable of being rendered universal by proper modifications and combinations. Euler had proposed a more general construction for the case of chords; D'Alembert insisted that this method required a limitation to figures exempt from angles and from abrupt changes of curvature, and Lagrange is inclined to admit his exceptions. But after all, the question is merely a metaphysical refinement, since no abrupt changes can ever occur in the actual form of a chord; and a chord affording a harmonic of unlimited acuteness will approach without limit to a mathematical angle. The author begins, in this essay, with considering the motions of a finite number of bodies, and then proceeds to the affections of a fluid, which he reduces to the same equations as are applicable to the motions of chords, and these he integrates in D'Alembert's manner. He lastly examines the phenomena of the grave harmonics observed by Tartini, and explains them very satisfactorily from the analogy of the beats of discordant sounds. 5. New Researches on Sound, *Misc. Taur.* ii. 1760-1, p. 11. The same subject is here continued, and extended to the divergence of sound, which had before been examined by Euler. The author now admits that there is no inconsistency in the demonstration of Newton and Cramer, which deduce the same velocity from different laws of the supposed motion, since the velocity is really uniform in all cases. The oscillations of a heavy chain are computed, and some remarks are made in conclusion respecting the sounds of flutes. 6. On the Maxima and Minima of Indefinite Integrals, p. 173. This essay contains the foundation of the method of independent variations, which has excited so much attention, for the universality of its application and the utility of its results. It was received with distinguished applause by Euler, as fulfilling his own wishes for the extension of a similar method; and it was Euler who more fully explained its principles, and gave it the name of the method of variations, which has since been generally applied to it. In fact, however, the foundation of the method had long before been laid by Leibnitz, under the name of differentiation from curve to curve; and he had proved that the process of integration, with respect to one kind of variation, might be applied to the differentials or fluxions taken in another manner, without the necessity of first obtaining the fluent: and Euler had employed this consideration in treating of the geometrical properties of curves affording maxima or minima; but his method is less simple and less general than that of Lagrange, who first pointed out the universality of the principle, that the variation of the fluxion is equal to the fluxion of the variation, and showed its utility in many cases of such integrations, as leave the expression concerned still a fluxion of another kind; and in the mechanical application of the method, he made the fluxion of the ordinate of a vibrating chord represent its inclination to the axis at any given time, whilst its variation indicated its velocity or its change of place in successive intervals of time, and the fluxion of a revolving solid to relate to the magnitude of its different parts, whilst its variation depended on its rotatory velocity. The steps of the method are generally simple and easily understood, at least they may and ought to be rendered so; but the merit of the invention is not the less because it admits of a very ready application, and because it might have occurred to a less distinguished mathematician; as indeed something nearly resembling it seems to have been employed by Fontaine in 1734, under the name of the fluxio-differential calculus, in the investigation of a tautochronous curve. 7. It was particularly in demonstrating the law which is called the law of the least action, that Lagrange completed the theory of variations, where Euler had felt its deficiency; and the Application of the Method to several Mechanical Problems constitutes the second part of the Memoir, p. 106. The author takes occasion also to correct an error of D'Alembert, who had imagined that there was no necessity that the different strata of a given density, in a body like the earth, supposed to be in a state of fluidity, should all be level, which, however, is here shown to be a necessary consequence of D'Alembert's own equations. 8. Addition to the Memoir on Sound, p. 323; admitting the difficulty raised by D'Alembert respecting the continuity of the figure of a chord, and acknowledging that the initial figure must not be supposed angular; while, in fact, as M. Fourier has lately demonstrated, and as had been remarked many years ago in this country, an infinite series of harmonic curves may approach infinitely near to two right lines meeting in an angle. 9. Problems relating to the Integral Calculus, *Misc. Taur.* iii., 1762-5, p. 179: a miscellaneous paper, containing remarks on the resolution of equations, containing fluxions

Lagrange,

Lagrange. of different orders; on some cases of the motions of fluids; on the vibrations of chords; on the properties of small oscillations in general; on loaded threads; on central forces; and on the theory of Jupiter and Saturn. 10. An Arithmetical Problem, *Misc. Taur.* iv., 1766-9, p. 44. This paper, dated at Berlin, contains a complete resolution of all equations of the second degree, having whole numbers for their roots: a problem like most of those of Fermat, of more curiosity than utility, but well calculated to exercise the powers of minds like those of Euler, Lagrange, Legendre, and Gauss. The question which is the particular subject of this paper was proposed as a challenge by Fermat, to his contemporaries in England, and correctly answered by Wallis, though without a very satisfactory demonstration. 11. Integration of an Equation, p. 98: a case in which the whole equation is integrable, though its parts, even when properly separated, are incapable of perfect integration. 12. On the Method of Variations, p. 163: in answer to Fontaine, and to Le Seur and Jacquier, who had attacked him in their *Integral Calculus*. 13. On the Motion of a Body attracted by two fixed Centres, p. 188-216, including the effects of different supposed laws of attraction. 14. On the Figure of Columns, p. 123. This memoir contains an attempt to demonstrate that the cone is a more advantageous figure for the strength of a column than any conoid, and the cylinder than any cone. But the calculations are founded on the erroneous supposition that the column must bend before it breaks; and, even upon this hypothesis, it appears possible to assign a stronger form than a cylinder, since the summit and the base of the cylinder must certainly contain some useless matter. 15. On the Mean of a number of Observations, p. 167: showing the advantage of taking the mean from the theory of probabilities. 16. On the Impulse of Fluids, *Misc. Taur.*, 1784-5, i., p. 75. The author observes, that this impulse will be measured by a column of twice the height due to the velocity when the whole impulse of the jet is received by an obstacle, but of the simple height when a limited surface is exposed to the force of a larger stream. 17. On the Integration of some Irrational Fluxions, ii., p. 218: involving the square root of an expression ascending to the fourth power of the variable quantity.

18. Some of the later of these papers are subsequent in date to those which are found in the *Memoirs of the Academy of Berlin*; but the order of enumeration is of little consequence. The first communication of Lagrange to the Academy, of which he was made director, is on Tautochronous Curves, *Mém. Berl.*, 1765, p. 364. The paper is dated 1767; and it contains a completion of Fontaine's investigation of the subject. 19. On the expected Transit of Venus, 1766, p. 265. The author has here analytically investigated the curves of immersion and emersion for the different parts of the earth. But, as Mr Delambre observes, in order to arrive at the very easy and tolerably accurate solution previously given by Delille and Lalande, he is obliged to employ in succession several elaborate expedients, founded on some very subtle principles, accompanied by various transformations of his ordinates, while by a trigonometrical calculation of a few lines we may obtain a more complete formula, comprehending even the terms which he has neglected, and which, although very small, are not absolutely insensible. At the same time, he has certainly applied his formula to the calculation of the parallax of the sun in a very convenient manner, which had accidentally escaped both Delille and Lalande, though it follows readily from the trigonometrical calculation. 20. On Indeterminate Problems of the Second Degree, 1767, p. 165. This is the first of a numerous series of papers relating to this difficult branch of analysis, which, notwithstanding its perfect inutility, has afforded sufficient scope for the exertion of talent, to give celebrity to the names of Diophantus and Fermat among the most ingenious of mathematicians. 21. On Numerical Equations, p. 311. This subject was also much cultivated by the author at a subsequent period: he here finds an equation for the differences of the roots, and exhibits the result in the form of a continued fraction. 22. Continuation of the Memoir on Numerical Equations, 1768, p. 111. The method of continued fractions is still further improved. 23. On the Resolution of Indeterminate Problems in whole Numbers, p. 181. 24. On the Resolution of Literal Equations by Series, p. 251. The contents of these memoirs have been principally merged in the author's later productions. 25. On the Force of Springs, 1769, p. 167. It is demonstrated in this interesting paper, that the force of a hair-spring approaches to the law of a circular pendulum, the more nearly as its length is greater. 26. On Kepler's Problem, p. 204: an application of the methods explained in the last volume, especially of a very elegant formula for the reversion of series. 27. On Elimination, p. 303: a refined and general method of exterminating a quantity from an equation, which, however, is somewhat intricate, even in the simplest cases. 28. Remarks on Isochronous Curves, 1770, p. 97: chiefly in answer to Fontaine, who had attacked him, and who had claimed the invention of the test of integrability of an expression containing

several variable quantities. Lagrange observes, that he might very possibly have rediscovered it, but that it was published by Nicolas Bernoulli in 1720: by Fontaine not till 1738. 29. On Arithmetical Theorems, p. 123; relating to the decomposition of a number into squares. 30. On the Resolution of Equations, p. 134. 31. On a Theorem respecting Prime Numbers, 1771, p. 125. A demonstration of the property of prime numbers discovered by Mr Wilson, and published by Waring; and of some other theorems of Waring. 32. On Equations, p. 138: in continuation. 33. On a New Mode of Differentiation and Integration, 1772, p. 185. The novelty consists in considering the characteristic of a fluxion as a quantity multiplying the letter to which it is prefixed, and inferring by induction that the result of the combinations obtained will in general remain unaltered by the supposition. The grounds of this method have been of late more fully explained by Arbogast and others. The results are here applied to interpolations, and to differences of various orders. 34. On the Form of Imaginary Roots, p. 222: in general reducible to $A + \sqrt{-1} B$. 35. On Astronomical Refractions, p. 259: without any practical applications. 36. On Equations of Partial Differences, p. 353; especially on finding multipliers to make them integrable. 37. On undisturbed Rotation, 1773, p. 85: a more direct method of investigation than that of Euler or D'Alembert, but without any new results. 38. On the Attraction of Elliptic Spheroids, p. 121. The author observes, that Maclaurin's prize essay is a masterpiece of geometry, comparable to the best works of Archimedes, though D'Alembert had once doubted of the accuracy of some of his propositions. Thomas Simpson's was the first analytical solution of the problem, but it was indirect, and depending on series only. In this paper the method of demonstration only is varied. Legendre and Laplace subsequently continued the inquiry. "But Mr Ivory," says Delambre, "has lately shown us that a very simple consideration may in some cases supersede a multitude of calculations, and even afford us theorems to which the most prolix computations could scarcely have conducted us." 39. On Triangular Pyramids, p. 149: an analytical determination of the content, and of the figures that may be inscribed in the pyramids, when their six sides are given. 40. Arithmetical Researches, p. 265: on the integral roots, in equations of the second degree. 41. On Particular Integrals, 1774, p. 197. Laplace had already pointed out the occasional occurrence of integrals not included in the general and direct expression obtained by the usual modes of integration. Such values are here deduced from the variation of the quantities originally considered as constant, which often affords us an equation of a different form, and leads to values not comprehended in the regular expression of the integral. 42. On the Motions of the Nodes of the Planetary Orbits, p. 276. Euler, Lalande, and Bailly had found some expressions for the temporary change of position of the nodes; the equations are here integrated, and the total changes determined. 43. On Recurring Series varying in two ways, or on Partial Finite Differences, 1775, p. 183: with an application to the theory of chances, upon Laplace's principles. 44. On Spheroids, p. 273: a demonstration of Maclaurin's theorem (Fluxions, art. 653) concerning the attraction of a compressed spheroid or an amygdaloid; derived from the formulæ contained in the former papers. 45. Arithmetical Researches continued, p. 323: demonstrating some theorems of Fermat with which Euler had not succeeded; yet leaving others still unattempted. 46. On the Mean Motions of the Planets, 1776, p. 199: showing that all their changes are periodical. Laplace had detected an error in the author's reasoning when he attributed secular equations to the motions of Jupiter and Saturn, the expressions containing the terms in question being compensated by others which he had neglected. 47. Cases of Spherical Trigonometry solved by Series, p. 214: without any apparent advantage. 48. On Integration by continued Fractions, p. 236: gives an example of the binomial theorem converted into a continued fraction, which, however, exhibits no particular elegance nor simplicity. 49. On the Number of Imaginary Roots of Equations, 1777, p. 111. Harriot was the father of the doctrine of equations. Newton made great improvements in it, but his rule remains imperfect with regard to the higher equations, even with the additions of Maclaurin and Campbell. In the present paper the theorem of Waring is demonstrated, without any material attempt to extend it. 50. On the Diophantine Analysis, p. 140. It is remarked that Fermat left all his propositions undemonstrated, except this theorem, that the sum of two biquadrate numbers can never be a square. 51. On Escapements, p. 173: an investigation of the best forms of pallets for the dead beat and the recoiling escapements. 52. On determining the Orbits of Comets by three observations, 1778, p. 111-124. The first part of this memoir is historical and critical, and the author allows due credit to the ingenuity of Newton's method: his own does not appear to have been of any practical utility. 53. On the Theory of Telescopes, p. 163: comparing the general theorems of Cotes and Euler, and applying

Lagrange. the method of recurring series to their demonstration; with a rule for determining the magnitude of the field. 54. On the Expression of the Time in a Conic Section, p. 181: after Lambert, who determines it from the chord of the arc described, the sum of the revolving radii, and the great axis: the theorem is here analytically demonstrated. 55. On Particular Integrals, 1779, p. 121: examples from some mechanical curves. 56. On Geographical Projections for Maps, p. 161-186. The methods here proposed for the construction of maps have been found too intricate for adoption. 57. On the Theory of the Libration of the Moon, 1780, p. 203. In the prize essay on the moon's libration, the author had made the first application of the method of variations: the investigation is here continued; and it is observed that the moon cannot be of homogeneous matter, nor its form such as would afford equilibrium to a fluid covering it, since the effects of the ellipticity, so determined, would be much less perceptible than they are. 58. Report on a Quadrature of the Circle, *Hist. Ac. Berl.* 1781, p. 17. This paper only requires to be noticed as a specimen of the author's condescension. 59. Theory of the Motion of Fluids, *Mém.*, p. 161: an application of D'Alembert's principles to the phenomena of running fluids, and to the motion of waves; but founded on an arbitrary assumption with respect to the depth affected by the waves. 60. On the Secular Variations of the Elements of the Planets, p. 199. The theory of perturbations is here examined by two methods, either comprehending the general form of the orbit, or regarding the local effects only. 61. Report on a Mode of finding the Form of the Earth, *Hist.* 1732, p. 35: a proposal of no value whatever. 62. On the Secular Variations of the Planets, *Mém.*, p. 169: a continuation of the former memoir, with all the details of the application, and a determination of the change of the place of the ecliptic, together with a determination of the permanency of the general arrangement of the system, depending on the exemption of the mean distances from all variations not periodical, while the other elements are liable to greater alterations. 63. On the Periodical Variations of the Planetary Motions, 1783, p. 161: a sequel to the memoirs on the secular variations. 64. Additions respecting the Secular Variations, p. 191: completing the examination, and extending it to the case of Jupiter and Saturn, which had before been investigated by Laplace. 65. On the Correction of the Errors of Astronomical Approximations, p. 224. The errors here considered arise from the employment of the powers of the arcs described in the equations concerned, these arcs increasing without limit; they may be avoided by means of approximations founded on the supposition of the variation of the elements. Laplace had before employed a method still more refined. 66. On a Particular Mode of Approximation, 279: resembling that which Briggs employed for making logarithms. 67. On a New Property of the Centre of Gravity, p. 290: relating to the mutual distances of the bodies. 68. A direct and general Determination of the Motion of a Comet, p. 296. In this third memoir the problem is reduced to equations of the eighth or seventh degree. 69. Theory of the Periodical Variations of the Planetary Motions, 1784, p. 187: continuation of the memoir of the preceding year, containing the independent variations of the eccentricities and inclinations for the six principal planets; with a numerical application of the formulæ demonstrated in the first part. 70. On the Integration of Equations of Linear Partial Differences, 1785, p. 174: entering into further details of the method laid down in a former paper, which is here applied to the problem of trajectories, a problem once proposed by Leibnitz as a trial of strength to Newton, who was not fully aware of the nature of the difficulty intended to be combated: it was, however, solved in England by Taylor, though indirectly. Nicolas Bernoulli and Hermann gave a more complete solution, and Euler added still more to the generality of the investigation. The author observes that the problem is a mere curiosity; there is, however, one case in which a trajectory of the kind here considered is actually applicable to a natural phenomenon of common occurrence, which is that of a wave diverging from a point in a gradually shelving shore; for the figure or direction of the collateral parts of such a wave may be shown to be the orthogonal trajectory cutting an infinite number of cycloids beginning at the given point. 71. On the Motion of the Aphelia of the Planets, 1786, i.; a geometrical investigation, in the manner of Newton, intended as an appendix to the *Principia*. 72. On the Theory of Sound and Waves. This paper is also intended to complete the demonstrations contained in the same work. The volume in which both these interesting memoirs appear seems to have been published out of the regular order, from some circumstances connected with the death of Frederick; and it is wanting in many of the British libraries. 73. Note accompanying a Memoir of Duval le Roi, 1786-7, p. 253. On the Secular Equations of the Georgian Planet. 74. On a Question relating to Annuities, 1792-3, p. 235: the case of an annuity supposed to commence after a death, and to cease at a given age. 75. Additions to former Memoirs, p. 247: on recurring series (n. 43;

on elliptic spheroids (n. 38): on interpolations, in Mouton's manner, Lagrange. comprehending the inequality of the distances of the observations; on the secular equation of the moon (n. 64.) After Laplace's great discovery of the cause of the secular acceleration, Lagrange found that it might have been easily deduced from his own calculations, almost in the same form, if he had not accidentally neglected the application, from having assured himself, in 1783, that the results of a similar computation were nearly insensible in the case of Jupiter and Saturn. It was in 1787 that the discovery of Laplace was announced. The acceleration here computed is 10^{-5} for the first century after 1800. Mayer found it $9''$, from a comparison of observations. 76. On a general Law of Optics, 1803, *Math.* p. 3. a demonstration of the foundation of the method long used by English opticians for determining the magnifying powers of telescopes of all kinds, which form an image of the object-glass beyond the eye-glass, by measuring the diameter of that image. The author hazards, in this paper, the very singular assertion, that the illumination of the object must be the same in all telescopes whatever, notwithstanding the common opinion, that it depends on the magnitude of the object-glass; and his reasoning would be correct if the pupil of the eye were always less than the image of the object-glass in question; since, as he observes, the density of the light in this image is always inversely as the magnifying power; but he forgets to consider that the illumination on the retina, when the whole pencil is taken in, is in the joint ratio of the density and the extent; a consideration which justifies the common opinion on this subject, and shows that a most profound mathematician may be grievously mistaken in his conclusions, if he proceeds to calculate upon erroneous grounds. It deserves, however, to be remembered, that the brightness of any given angular portion of a magnified image must always be somewhat less than that of an equal portion of the object seen by the naked eye; because it can be no greater if the pencil fills the pupil, and will be less in proportion as the pencil is smaller than the pupil, besides the unavoidable loss of light at the refracting surfaces.

77. The later works of Lagrange have principally been published at Paris, and most of them in the various collections of the academy. The earliest of these are the prize memoirs; and, first, the Essay on the Libration of the Moon, which obtained the prize in 1764, *Ac. Par. Prix.* ix., 1772. It is in this memoir that the method of variations was first practically applied to a mechanical problem. 78. On the Inequalities of the Satellites of Jupiter, in 1776; including the consideration of their mutual perturbations, and consequently a case of the problem of six bodies. The author never resumed the subject, but its investigation was completed by Laplace. 79. A New Method of solving the Problem of Three Bodies, in 1772. 80. On the Secular Equation of the Moon, in 1774, *M. Sav. Etr.* vii. for 1773: an unsuccessful attempt, with conjectures respecting the existence of a resisting medium, and even doubts of the accuracy of the foundation of Halley's discovery. 81. A prize memoir, On the Perturbation of Comets passing near Planets, *M. Sav. Etr.* x., Par. 1785, p. 65: finding the path directly, without regard to the conic sections, and employing three different modes of computation for the different parts of the orbit. 82. On forming Tables by observations only, *Mém. Ac. Par.* 1772, i., p. 513. The method of recurring series is principally employed, and the author observes, that the problem is more useful than difficult, giving an experimental example in the equation of time, for which he obtains, from the results of the table, an expression very near the truth. Delambre remarks that this is only a continuance of the system adopted by Ptolemy and the other ancient astronomers, showing what we might have done in a circuitous manner by pure mathematics if Newton and the laws of gravity had not existed; and he thinks the paper only valuable as a specimen of Lagrange's talent for overcoming difficulties which he might more easily have avoided. 83. On the Nodes and Inclinations of the Planetary Orbits, 1774, p. 97: with details of the calculations for all the planets. 84. On the Variation of the Elements of the Planets, *Mém. Math. Inst.* 1808, p. 1. The object of this paper is to show, as Poisson had done before, that all the changes of the system are periodical. The method is more general, but less simple, than that of Laplace, who first discovered the principle by induction. The lunar acceleration is given as an example. M. Poisson has extended his calculations to quantities of the second order, which do not enter into Lagrange's investigations. 85. On the Variation of Independent Quantities in general in Mechanical Problems, p. 257. The author observes, that many of the modern improvements of mathematics depend on doing away the distinction between constant and variable quantities, which was so valuable when it was first enforced by Descartes. 86. A second Memoir on the Variation of Independent Quantities, 1809, p. 343: simplifying the general application of the doctrine.

87. Lectures on Arithmetic and Algebra, *Séances des Ecoles*

Lagrange. *Normales*, Year III., 1794-95. The first lecture relates to the elements of arithmetic, the second to the lower orders of equations, and the third to the higher. All these lectures, under the name of "conversations," were taken down in short-hand by some of the students, and afterwards corrected by the professors.

88. An Essay on Political Arithmetic, Roederer, *Collection de divers Ouvrages*, Paris, Year IV., 1795-96.

89. In the *Journal de l'Ecole Polytechnique*, we find an Essay on Numerical Analysis, and on the Transformation of Fractions, vol. ii., 1798, p. 95. It contains the elementary theory of continued fractions, and the mode of reducing them. 90. On the Principle of Virtual Velocities, p. 115; chiefly relating to pulleys. 91. On the Object of the Theory of Analytical Functions, vi., 1800, p. 232: a detailed explanation of the grounds of the theory laid down in the separate publication on this subject. 92. Analysis of Spherical Triangles, p. 270: giving all their essential properties in a concise form. 93. Lectures on the Calculus of Functions, xii., 1804: published also separately in 8vo; a commentary on the theory of functions, and a supplement to it, contained in twenty lectures. 94. Two more Lectures, xiv., 1808: at the end, chiefly relating to the method of variations. 95. On a Difficulty respecting the Attraction of Spheroids, viii., xv.; remarks which may serve as a commentary on a passage of the *Mécanique Céleste*.

96. On the Origin of Comets, *Connaissance des Temps*, 1814. 97. On the Calculation of Eclipses, as affected by Parallax, 1817: from the *Berlin Almanac* for 1782. This memoir, as Delambre observes, is singularly attractive to a person previously unacquainted with the methods which are employed; but though the formulæ first introduced are direct and rigorously accurate, the whole investigation ends in an approximation which wants both these properties.

98. The most important of all the works of Lagrange are those which have appeared in separate volumes; and among these we may reckon his *Additions à l'Algèbre d'Euler*, 8vo, Lyons, 1774, vol. ii.; German, 1796; English, 1797. They relate chiefly to continued fractions and to indeterminate problems, and constitute the most valuable part of the whole work, which, in its abridged form at least, is far inferior to Maclaurin's Algebra. 99. *Mécanique Analytique*, 4to, Par. 1788, 2d edit., vol. i., 1811; vol. ii. by Prony, Lacroix, and Binet, 1815. This work exhibits a uniform and elegant system of mechanical problems, deduced from the simple principle of virtual velocities, which was well known to former authors, but never so extensively applied. It has been remarked, that many parts of it may be read with advantage, even by those who are not competent to enter into any of the computations, exhibiting such a history of the progress of the science as could only have been sketched by a master. The new edition, begun at the age of seventy-five, comprehends all the improvements contained in the author's later memoirs on various subjects. 100. *Théorie des Fonctions Analytiques*, 4to, Par. 1797, 1813. The abstract theory of analytical functions has been very fashionable among modern mathematicians; but the improvements which it contains are chiefly of a metaphysical nature, if they can with propriety be called improvements. The notation is less simple than that which is in common use, and has been abandoned by the author in some republications of the works in which he had at first employed it. The calculations, too, are often more intricate than others which afford the same conclusions. 101. *Résolution des Equations Numériques*, 4to, Par. 1798, 1808. The refined and abstruse speculations contained in this volume are more calculated to promote the advancement of the abstract science of quantity, than to be applied, as the title would seem to denote, to the purposes of numerical computation. The methods investigated are in general laborious and complicated, though instructive, and capable of extensive application; and for equations of which all the roots are real, the author himself recommends M. Budan's method, as preferable to his own. The second edition contains a number of very interesting notes, which are full of ingenuity and novelty.

The author of so immense a series of laborious investigations must certainly have been a most extraordinary man. He had acquired the character of an illustrious mathematician almost in his boyish years; and he continued to apply the force of his powerful mind, for more than half a century, to the almost uninterrupted pursuit of his favourite sciences. It seems, however, that his earliest were also his greatest successes; and all that followed was as little as could well be expected from a continued employment of the means which he possessed at the beginning; for, in fact, the whole taken together appears to bear a stronger character of great industry than of great sagacity or talent.

"It was formerly usual," says Delambre, "for mathematicians to inquire, in every investigation, for some general considerations, which might be capable of simplifying it, or of reducing it to a problem already resolved, and to endeavour by these means either

to abridge the calculation, or sometimes to supersede it altogether. But since the discovery of the infinitesimal calculus, the facility and universality of this method, which often renders the possession of any talent in the calculator wholly unnecessary, has made it more usual for mathematicians to direct their chief attention to the perfection of this all-powerful instrument. But at the present day, when researches of this kind appear to be completely exhausted by the labours of Euler, Lagrange, and other industrious contemporaries, it might perhaps be more advisable to return to the ancient method, and to follow the example of [Newton, surely, and of] Daniel Bernoulli, who, as Condorcet observes, was entitled to the praise of moderation in the introduction of his calculations. Lagrange was in the habit of employing his sublime talents in a different manner. He liked to make everything dependent on his analysis, though, in some instances, he united both methods in the highest degree, as his invention of the calculus of variations bears witness. His reducing the theory of sound to that of the vibration of chords, is a specimen of a very ingenious simplification; as well as his mode of computing the planetary motion by the variation of the elements of their orbits, which is also applicable to all other cases of the operation of small disturbing forces. But it must be confessed, on the other hand, that he has sometimes created difficulties where none existed, by applying his profound and ingenious methods to the solution of elementary problems, which may be obtained from a construction of the simplest kind; and the powerful agents which he employs, on many trifling occasions, remind us only of the man in the fable, who came to borrow the club of Hercules, and the thunder of Jupiter, for the purpose of destroying a flea;" or of the modern mathematician who, without any fable, or any figure of rhetoric, proposed to adjust a standard measure by placing it at a distance and viewing it with a good telescope. The habit of relying too confidently on calculation, and too little on common sense, will perhaps account for the mistakes of Lagrange which have been already noticed, respecting the forms of columns, and the illumination of optical instruments; nor are they the only instances of the kind which may be produced from the modern history of the sciences. It seems, indeed, as if mathematical learning were the *euthanasia* of physical talent; and, unless Great Britain can succeed in stemming the torrent, and in checking the useless accumulation of weighty materials, the fabric of science will sink in a few ages under its own insupportable bulk. A splendid example has already been displayed by the author of the article ATTRACTION; and, to do justice to our neighbours, it must be allowed that they have received the boon with due gratitude, and acknowledged it by merited applause:—"All the analytical difficulties of the problem," say Legendre and Delambre (*Mém. Inst.* 1812), "vanish at once before this method; and a theory, which before required the most abstruse analysis, may now be explained, in its whole extent, by considerations perfectly elementary." It is indeed only when a subject is so simplified that the investigation can be considered as complete, since we are never so sure that we understand the process of nature as when we can trace at once in our minds all the steps by which that process is conducted. It is not without some reason that a similar disposition to revel in the luxury of mathematical sports has been sometimes objected to in Laplace, a man of equal analytical acquirements with Lagrange, but possessed, apparently, of greater sagacity, and certainly more successful in his application of mathematics to physical researches, although he also seems, on some occasions, to have suffered his habits of abstract reasoning to lead away his attention from the true conditions of the problem, particularly in his first supplement respecting capillary attraction, which concludes with an equation so erroneous that he has been obliged to abandon it in silence. (See the article COHESION.) Another instance of ill-applied computation has been noticed in the article CHROMATICS; when Laplace attempted to deduce the laws of extraordinary refraction from the principle of the minimum of action, he seems to have forgotten that the demonstration of that principle, in his own great work, rests expressly on a condition which is here wanting, that "the forces concerned must be functions of the distances," and of course independent of the directions. These imperfections, however, do not deserve to be noticed as materially affecting the general merits either of Lagrange or of Laplace, but they may be considered as accidents which ought to warn us against relying too implicitly on authority, however high, when it appears to militate against clear, simple reasoning, and sound common sense.

(Delambre, *Mém. Inst.* 1812, ii.; *Journal de l'Empire*, 28th April 1813; Virez et Potel, *Précis Historique*, Paris, 1813, in 4to; Cosali *Elogio*, Padua, in 8vo, 1813; Maurice in *Biographie Universelle*, xliii. Paris, in 8vo, 1819.) (T. Y.)

jab, situate about a mile from the eastern bank of the River Ravee. It is surrounded by a brick wall, formerly 25 feet high, but which has been lowered by order of the British government since the annexation of the Punjab to their dominions. The streets of Lahore are narrow, but contain many lofty houses, inclosed within extensive dead walls. It is still a place of considerable size, with a good bazaar; but it is not inhabited by wealthy people. On account of the frequent sackings it has sustained, they have migrated for safety to Amritsir. The palace was originally founded by Achar, and enlarged by his successors. Across the Ravee, at Shah Durra, about 2 miles N. of Lahore, stands the celebrated mausoleum of Jehangeer, within a wall of nearly 600 yards square. It is a magnificent building, 66 paces on each side, and still in very good condition. To the southward of this, in the open plain, is to be seen the tomb of Noor Jehan Begum, a building 36 paces square. In 1812 Runjeet Singh was building a very thick wall and rampart round the city, with a deep, broad ditch. The palace has also been surrounded by a deep and broad ditch, the whole faced with brick, and the earth thrown inwards, so as to form a broad rampart, with bastions at intervals. Judging from the ruins in the neighbourhood of the city, Lahore must have greatly fallen from its ancient grandeur, yet the domes and minarets of the mosques, the lofty walls of the fort, the splendid mausoleum of Jehangeer, and the numberless inferior tombs and temples that surround the town, still render it an object of curiosity and admiration. Lahore was taken by Sultan Baber, A.D. 1520, and was for some time the seat of the Mogul government. Since that period it has undergone many revolutions, and was for a considerable time possessed by the Abdalli Afghans of Cabul, by whom it is named Sikrei. In 1799 Runjeet Singh was by Zeeman Shah invested with the government of Lahore, and shortly afterwards this adventurer extended his power over the whole of the Punjab. When, after the death of Runjeet Singh, the enormities committed by those who grasped his power compelled the English to put an end to his dynasty, Lahore, with the rest of the country, became British. The events connected with its subjugation are related in the historical sketch of the Punjab. The city of Lahore is in Lat. 31. 36., Long. 74. 21.

LAIGLE, or L'AIGLE (the ancient *Aquila*), a town in France, department Orne, is situated on the sloping sides of two hills, on the River Rille, 80 miles W.S.W. from Paris. Its chief manufactures are cutlery, hardware, leather, paper, cotton, and linen. It has a large trade in corn, wood, and cider, together with needles and pins. The town is well built, but contains few buildings worthy of note, except the large church of St Martin's, and an old chateau built of brick, and surrounded by tall and beautiful lime trees. In the vicinity is the mineral well of St Santin. Pop. 5678.

LAING, MALCOLM, a sagacious historian, or rather historical critic, was born in 1763, at his paternal estate in Orkney, and educated at the grammar school of Kirkwall. Removing to Edinburgh, he studied law at the university, and took a leading part in the debates of the Speculative Society, a literary club with which the early lives of Scott, Jeffrey, Brougham, Mackintosh, and many other eminent men, were long associated. In 1784 he passed advocate, but failed to work himself into practice. He only distinguished himself at the bar on one occasion, when he undertook the defence of Joseph Gerrald on his trial for sedition in 1794. He first made himself a name in letters by finishing and carrying through the press the last volume of Henry's *History of Great Britain*, left incomplete by the author's death. Henry had been a staunch conservative. Laing was an equally staunch liberal. Each wrote from the stand-point of his own party, and the principles and views of politics in the last volume of the history are at signal variance with those of the other parts of the work.

Dr Parr used to speak in terms of the highest praise in regard to that part of the narrative which treats of the conduct and treatment of Perkin Warbeck.

In 1800 he published his *History of Scotland from the Union of the Crowns, on the Accession of James VI. to the Throne of England, to the Union of the Kingdoms in the reign of Queen Anne*. Two preliminary dissertations accompanied this work, one on the Gowry Conspiracy, and another directed against the authenticity of the poems of Ossian. In 1804 a second edition of the "History" was called for; and the author seized the occasion to add a third essay, *On the Participation of Mary Queen of Scots in the Murder of Darnley*. Laing's only other contribution to history was his edition of the *Historie and Life of King James the Sixth*, published in 1804 from a copy of the original manuscript, from which Crawford of Drumsay, historiographer to Queen Anne, had compiled his *Memoirs of the Affairs of Scotland*. These "Memoirs" had been written in the interest of Mary Queen of Scots, and professed to be based on a MS. history of the times. Laing discovered the original manuscript, and proved, with his usual acuteness, that Crawford had so garbled and mutilated it as to have committed "one of the grossest literary forgeries that had ever been employed to pervert the genuine history of Scotland." In 1805 Laing married Margaret Carnegie of Craigo, in Forfarshire. Two years later he entered parliament as member for Orkney, but bad health drove him back into private life after a single session. Retiring to his native place, he recovered a little, and spent the remainder of his life in agricultural pursuits. His death took place somewhat suddenly in November 1818. To Mr Laing, as a historian, belongs the undoubted merit of having cleared away much rubbish, removed many prejudices, refuted numerous and grave errors, detected not a few impostures, and generally placed both the character and events of that portion of our national history of which he treats in a clearer and more satisfactory light than he found them. Although he had many enemies, few dared to reproach him with a disregard of truth. His sagacity and acuteness led him instinctively to results, the most of which have been confirmed by more recent investigation.

LAIRESSE, GERARD, a celebrated Flemish painter, was born at Liege in 1640. He learned his art from his father, himself a painter of some note, and at the age of fifteen received commissions both for portraits and historical pieces from the Electors of Cologne and Brandenburg. He painted with great rapidity, and earned large sums of money, but extravagance and dissipation ran away with his gains, and he retired to Utrecht. While living there in great poverty, two of his pictures fell into the hands of Gerard Vlyenburg, a famous dealer of Amsterdam. By his advice Lairesse removed to that city, and his paintings always found there a ready and lucrative sale. At the age of fifty he had the misfortune to lose his eye-sight, and he then began to lecture on the principles of drawing and painting to the artists and students who crowded to hear him. After his death, which took place in 1711, in his seventy-second year, the notes of these lectures were re-edited by the Society of Painters at Amsterdam into that famous treatise on the art of painting which passes under his name. Lairesse's drawing is marked by grace and ease. His colouring, deficient perhaps in vigour, is correct, natural, and well-blended. He excelled in subjects drawn from the ancient mythology, especially bacchanalian scenes. These enabled him to display his knowledge of classic costume and architecture, in which he was deeply learned.

LAKE OF THE THOUSAND ISLES, in British North America, is a creek on the N.E. side of Lake Ontario, and forms the commencement of the River St Lawrence. Extending in a N.E. direction from Kingston, it is

Lairesse
||
Lake of the
Thousand
Isles

Lake of the 40 miles in length; its greatest breadth is 15 miles. The islands with which it is studded amount to about 1700. Wolfe Island, the largest, is 10 miles in length, by 6 miles in breadth.

LAKE OF THE WOODS, in British North America, forming, along with the Winnipeg River, a junction between Lake Winnipeg and Lake Superior. N. Lat. 49., W. Long. 95. Its length is about 60 miles, and its circumference 300 miles. It is studded with beautiful wooded islands, and its shores are very deeply indented. Its principal feeder is the Rainy River, issuing from Rainy Lake, and its principal outlet is the Winnipeg River, falling into Winnipeg Lake.

LALANDE, JOSEPH JEROME LEFRANÇOIS DE, a most zealous and accomplished astronomer, born at Bourg en Bresse, on the 11th of July 1732, was the son of Peter Lefrançois, and Marianne Mouchinet, his wife.

His parents were in easy circumstances, and his education being somewhat too indulgent, the natural quickness and impetuosity of his temper was too little restrained. His earliest taste, like that of most other children, seems to have been for romantic tales; and he was fond of making little stories with such materials as he possessed, but their subject was chiefly religious. He was in the habit of living much with the Jesuits, and he imbibed from them a predilection for the pulpit. At the age of ten he used to amuse himself with making sermons, and preaching them to a select congregation. The comet of 1744, however, with its long tail, took more forcible possession of his imagination, and he watched it with the most unremitting attention. Having been sent to Lyons to continue his studies under the Jesuits there, he acquired a taste for poetry and eloquence, and was then inclined to devote himself to literature and to the bar, but an eclipse of the sun recalled his attention to astronomy. His parents wished him to follow the profession of the law, and with that view sent him to Paris, but he accidentally lodged in a hotel where Delisle had established an observatory, and this circumstance led him to become acquainted with that professor, and to attend his lectures. These lectures were by no means popular; and the want of a more numerous audience made it easy for the professor to accommodate his instructions to the fixed attention and rapid progress of his new pupil, who became singularly attached to his master, and to all the methods which he employed. Lalande attended, however, at the same time, the physico-mathematical lectures of Lemonnier, who was more in credit as a teacher, and who also took great pains for his improvement.

In the mean time he had completed his legal studies, and at the age of eighteen he was called to the bar as an advocate. His family was anxious for his return to Bourg, but just at that time Lemonnier obtained leave to nominate him as a substitute for himself on an astronomical mission to Berlin, where he was to make observations on the lunar parallax, corresponding with those which Lacaille was sent to the Cape to obtain. He was favourably received by Maupertuis, who introduced him to Frederick and his court; and was made a member of the Academy of Sciences at Berlin when he was about nineteen.

He remained a year in that city, observing at night, and passing his mornings in the study of the integral calculus, under Euler's directions, and his evenings in the society of Voltaire, Maupertuis, D'Argens, and other men of talents. It was not likely that his intercourse with such persons would confirm the principles which he had imbibed from the Jesuits; his moral conduct, however, does not appear to have been influenced by his change of sentiments. After his return to Bourg, he pleaded a few causes to oblige his friends, but the success of his operations at Berlin obtained him speedily a place in the Academy of Sciences at Paris; for, in 1758, before he was twenty-one, he was chosen to

fill up a vacancy in the department of astronomy, which had been open for some years. He soon afterwards offended his friend Lemonnier, by rejecting too harshly an unfounded objection of that astronomer to his method of computing the effect of the earth's ellipticity on the lunar parallax, which differed from Euler's formula. Lacaille, who drew up the report of a committee appointed on the occasion, decided in Lalande's favour; but Lemonnier remained dissatisfied, and would not see him for twenty years. He had some similar discussions, at a later period, with Duséjour, who was a little too severe in criticizing some of his approximations, as if they had been intended to be rigidly accurate, but their personal friendship remained unaltered.

For more than fifty years he continued to be a constant and voluminous contributor to the *Memoirs of the Parisian Academy*, as well as to other scientific collections. His investigations were always judiciously directed to the advancement of astronomy, but they can scarcely ever be said to have exhibited any marked features of talent, or of address, beyond what might be expected from the industry of a man of good ordinary abilities, confining himself almost entirely to one subject. He was always anxious to call the public attention to astronomy as a science and to himself as an individual. Thus, on occasion of the transits of Venus in 1761 and 1769, he addressed a circular letter to most of the governments of Europe, on the importance of obtaining a multiplicity of collateral observations, and he received in reply several invitations from sovereigns whose countries were more favourably situated for the purpose than France, to come and make the observations in person. He thought it unnecessary, however, to leave Paris on the occasion. He contented himself with being the first to announce to the public the result of the most satisfactory comparisons, and his countrymen seemed to give him almost the whole credit of everything that had been done by others in conformity with his suggestions. He was much mortified, however, in not receiving from Father Hell an account of the observations made at Wardhuus; and he was afterwards greatly inclined to dispute their accuracy, because Hell made the parallax smaller than he did by $\frac{1}{4}$ th of a second, whilst the mean of both results, which is $8''6$, agrees extremely well with the most modern computations; but, in the end, he did justice to the importance of Hell's observations.

He was constantly in the habit of passing a few months every year with his family in the country, and he occasionally amused himself, in the course of these visits, with mineralogical excursions, and with chemical studies. He delivered, about the year 1758, an oration before a public assembly at Lyons, on the advantage of monarchy above every other form of government; he even adhered to a similar opinion, and expressed it openly, in times when nothing but his celebrity as a man devoted exclusively to science, could have made it safe for him to declare it.

After having published the astronomical tables of Halley, he felt the necessity of a new collection, and determined to begin with those of Mercury, which he found the most imperfect. He pursued, for this purpose, a regular course of observations at the Palais Royal, where he used to go before sunrise in the winter mornings to see the planet in the twilight. Having occasion to refer to the observations recorded by Ptolemy, he found it necessary to refresh his acquaintance with the Greek language, which he had in some measure neglected. But, with all his labour and diligence, his tables of Mercury exhibited, in 1786, an error of forty minutes in the time of a transit. The circumstance mortified him extremely, but it led to a revision of the tables, and he afterwards succeeded in making them much more perfect. It must be recollected that, in the time of Hevelius, a transit was anxiously expected for four whole days before it occurred.

He next undertook to improve the tables of Mars and

Lalande.

Lalande. Venus. His tables of these planets were, on the whole, less accurate than those of Mercury, though more exempt from great occasional errors. He had computed their perturbations in the *Memoirs of the Academy*, but he never thought it worth while to compare his formulas with observation. The irregularities of Jupiter and Saturn were much more discouraging; he was obliged to confine himself, in discussing them, to the most modern observations, and he did not appear sufficiently to appreciate the empirical equations of Lambert, though they greatly diminished the errors of Halley's tables.

When Maraldi had given up the management of the *Connaissance des Temps*, Lalande and Pingré were candidates for the appointment. Lalande succeeded in obtaining it, but he had the modesty to confess that the work would have been more accurately performed by Pingré, if his connection with the church had not, according to the rules of the Academy, incapacitated him for the situation. He made the work, however, much more popular, as a miscellaneous publication, than Pingré was likely to have done; and he was less prejudiced than Pingré in the choice of his tables. He remained editor of the work from 1760 to 1775; it was conducted by Jeaurat from 1776 to 1787, and from 1788 to 1793 by Méchain. Lalande then undertook it once more, Méchain being engaged in some measurements with Delambre, and the Academy having been abolished, and its members dispersed.

Lalande had been disposed to call in question the assertion of Newton and Voltaire, that no comet could possibly come in contact with the earth, and he had proved that the effect of perturbations at least rendered their reasonings somewhat inconclusive. A short memoir on the subject, which was to have been read at a public sitting of the Academy, was accidentally omitted, as not very important, from the pressure of other business. This circumstance alarmed the sensibility of the public of Paris, who fancied that Lalande had foretold some dreadful catastrophe which the government was afraid to announce; and when the memoir was published, they insisted that its contents had been modified, to lessen the alarm. Duséjour made some objections to the author's reasoning, but the whole affair was soon forgotten.

A memoir on the length of the year was honoured with a prize by the academy at Copenhagen. Delambre, however, thinks the determination not so good as the earlier one of Lacaille, though much better than Mayer's, which was more commonly adopted. Lalande took great pains also with the subject of the sun's rotation, employing in his computations of the places of the spots an easy approximation, instead of Duséjour's more laborious methods; but being careful to compare with each other the most distant observations of the same spot. From the existence of this rotation he thought it reasonable to infer that the sun had also most probably a progressive motion, which would naturally be produced by any single impulse capable of occasioning a rotation. He had some discussions with Dr Maskelyne respecting the mode of computing the equation of time, in which Maskelyne appears to have had the advantage.

In the year 1762, Delisle resigned in his favour the professorship of astronomy in the College de France, which he kept for nearly forty-six years. He allowed the most attentive of his pupils to board with him at a cheap rate, doing his utmost on all occasions to promote their success in their studies and in life. Thus he brought forward Méchain and Dagelet, and afterwards his own nephew, who completed, with so much diligence and accuracy, the *Description of the Heavens*, which he had himself projected, and which had been begun by Dagelet before his unfortunate expedition. He was made a fellow of the Royal Society of London in 1763.

His health was generally good, though his constitution was delicate. He had an attack of jaundice in 1767, which was attributed to intense application, but he completely recovered from its effects by an attention to diet, and by the use of horse exercise. He then intended to leave all his property to the Academy, but he afterwards gave up his family estates to his relations, and lived on his appointments only, refraining from all kinds of luxuries, in order to be the more able to do acts of liberality to his friends, whom he always sought to oblige in the most delicate manner, and often without making his services known. He had a pension from Russia in the time of the Empress Catherine; it was suspended by Paul, but restored in 1805 by Alexander.

He was not particularly successful as an observer, but used to refer to the works of his contemporaries, Bradley and Lacaille, though not exactly, according to the expression of one of his biographers, "as Ptolemy had done to those of Hipparchus;" for Hipparchus must have been dead two centuries before Ptolemy was born. On the occasion of the disappearance of the ring of Saturn in 1774, he went to Béziers, in order to profit by the superior serenity of the air there, the climate of that country being supposed to be the best in France; but his observations were less valuable than others made at Paris and in London.

In the year 1798 he undertook an astronomical expedition to Gotha. He had once meditated an aerostatical voyage there; but his companion took care that their dangers should terminate in the Bois de Boulogne. He was received with much interest at Gotha by an assembly of astronomers that was collected from different parts of Germany. The object of the congress was perhaps not unmixed with personal vanity; but it had no political design to promote, unless the general adoption of the new French measures could be considered as a political object. Lalande was by no means a revolutionist; he was sufficiently free from any prejudices of education; but he openly condemned the political opinions of the day; and, in 1792, he even exposed himself to great personal danger in order to save the life of Dupont de Nemours, after the 10th of August; and he was equally useful to some of the clergy, whom he concealed in the buildings of the Observatory at Mazarin College, making them pass for astronomers. He had also the courage to publish accounts of Lavoisier and Bailly a short time after their deaths.

The attentions of the German astronomers gave him sincere pleasure. He was at all times extremely sensible to compliments, and even to flattery, though very regardless of satire. He used to call himself a sponge for praise and an oil-cloth for censure. He professedly believed himself endowed with all the virtues, modesty not excepted. He was so fond of notoriety, that he once undertook to exhibit the variations of the light of Algol to the public of Paris on the Pont Neuf; but the police interfered, thinking it right to prevent a disorderly assemblage.

Though Lalande can only be classed in the second rank as an inventive astronomer, or a mathematician, he certainly stands in the first as a professor and a popular writer. His methods of calculation have in most instances been already superseded by others more convenient or more exact; those which related to particular phenomena for want of sufficient precision, and those which were more general for want of being readily applicable, without continual repetition, to a sufficient number of concurring observations. It has been observed, that he may perhaps have been often too zealous in the pursuit of his favourite objects; but that, if he had possessed more circumspection, and less vivacity of character, he would have been more exempt from criticism, yet would have rendered less important services to science and to mankind.

His last illness was of a consumptive nature, and he

Lalande. seems to have accelerated its termination by attempting too much to harden himself. He died on the 4th of April 1807, nearly seventy-five years old, and in the perfect possession of his faculties. His last words, when he dismissed his attendants to rest, were, "I have need of nothing more;" and in a few minutes he was dead. Had he survived a few hours, he would have received a letter from Dr Olbers, announcing the discovery of a new planet, for which that distinguished astronomer afterwards received the fourth prize medal from the institution founded by Lalande in 1802, for the most important astronomical discovery made in the course of the year.

Of his voluminous and diversified publications, a simple enumeration of the subjects will perhaps be thought sufficient. The more important only of them will be criticised:—

1. We find, in the *Memoirs of the Parisian Academy of Sciences* for 1751, an account of his Observations at Berlin, which also appears in the *Memoirs of Berlin* for 1749, and a Latin translation in the *Acta Eruditorum* for August 1752. 2, 3. 1752–53, An Essay on the Lunar Parallax. 4. 1754, A Transit of Mercury. 5. Elements of Mars. 6. 1755, Longitude of Bëfilin. 7. Lunar Eclipse. 8. 1756, Transit of Mercury. 9. Lunar Parallax continued. 10. 1757, Observations at the Luxembourg. 11. Transit of Venus. 12. Secular Equations and Mean Motions. 13. A Gnomonical Problem. 14. Meridian Altitudes. 15. 1758, Perturbations of Mars by Jupiter. 16. Motions of the Planetary Nodes. 17. Change of Latitudes of the Stars. 18. 1759, Comet of 1682 and 1759. 19. 1760, Sun's Diameter. 20. Perturbation of Venus by the Earth. 21. Eclipse of 1760. 22. 1761, Solar Parallax. 23. Interpolation. 24. Transit of Venus Observed. 25. Solar Parallax. 26. Transit Computed. 27. Observed at Tobolsk. 28. In Denmark. 29. Compasses and the Variation. 30. Perturbation of Mars by the Earth. 31. Planetary Nodes. 32. 1762, Equation of Time. 33. Obliquity of the Ecliptic. 34. Horary Motion in Transits. 35. Nodes of Jupiter's Satellites. 36. Diameter of Venus. 37. Comet of 1762. 38. 1763, Eclipses of Jupiter's Satellites. 39. Solar Eclipses for a Spheroid. 40. Triangles, Rectilinear and Spherical. 41. 1764, Transit of 1769. 42. of Aldebaran. 136. Solar Eclipse of 1706. 137. Solar Eclipse of 1748. 138. v. 1803, Zodiac at Strasburg. 139. Eclipses calculated. 140. Opposition of Mars. 141, 142. Motion of Venus. 143. Motion of Mercury. 144. vi. 1806, A Transit of Mercury.

145. The earliest of his separate publications appear to have been two little volumes, intended for provincial circulation only, entitled *Etrennes Historiques*, 24mo, Par. 1755–56. 146. Another little article of his miscellaneous works was a *Discours qui a remporté le Prix de l'Académie de Marseille en 1757*, Mars. 1757. The subject was the spirit of justice, as tending to the glory and the stability of a government. 147. We have then *Three Letters on Platina*, *Jour. des Sav.* 1758, Jan. Jun.; 1760, Feb. 148. Letter on a new Sun Dial, *Jour. Sav.* June 1758, ii. 439; the lines being invisible when the sun does not shine.

149. *Tables Astronomiques de Halley*, 2 vols. 8vo, Paris, 1759. Containing several new tables, and an elaborate history of the comet of 1759, of which the author had computed the perturbations, according to the theory of Clairaut. 150. *Connaissance des Temps*, 16 vols. 8vo, Par. 1760–1775; 14 vols. 1794–1807. This work contains, besides the Ephemeris, an important selection of the most useful astronomical papers. On one occasion, for temporary reasons, these papers were published in a separate volume. 151. *Exposition du Calcul Astronomique*, 8vo, Paris, 1762; a companion to the Almanac.

152. *Oraison funèbre de Maurice Comte de Saxe*, 8vo, Par. 1760. 153. *Art du Papetier*, fol. Par. 1761. 154. *Parcheminier*, 1762. 155. *Cartonnier*, 1764. 156. *Chamoiseur*, 1764. 157. *Tanneur*, 1764. 158. *Mégissier*, 1765. 159. *Maroquinier*, 1766. 160. *Hengroyeur*, 1766. 161. *Corroyeur*, 1767.

163. Letter on Delisle's Calculations, *Journ. Sav.* Apr. 1761. 164, 165. In the 52d volume of the *Philosophical Transactions* for 1761 and 1762, we find several papers of Lalande; two on the transit of Venus; 166. One on Norwood's Measurement of the Earth; 167. An Account of a Comet; and, 168. An Account of Occultations of the Fixed Stars by the Moon. 169. In the *Transactions* for 1769, another paper on the Transit of Venus.

170. *Discours sur la Douceur*, 1763. This essay was intended as a sort of exercise for the author's own moral improvement; and he made it a rule to read it over every year, in order to assist him in commanding his temper. He may possibly have derived some little advantage from the practice, but he never acquired enough of self-command to refrain from wounding the feelings of another by any pointed remark that might suddenly occur to him.

171. *Astronomie*, 2 vols. 4to, Paris, 1764; 3 vols. 1771, 1792; vol. iv. 1780, not reprinted. This compilation far excelled in utility all former works of the kind, and will always be considered as exhibiting the most perfect picture of the science, such as it existed from 1760 to 1790, with all the details of practice and computation. Lémonnier called it, with some truth, the great newspaper of astronomy. The Treatise on the Tides, which constitutes the fourth volume, is chiefly a collection of observations, not sufficient even for the basis of a complete theory: an abstract of it may be found in the *Mém. Acad.* Dijon, ii. 1774. 172. *Figure du Passage de Venus de 1769*, Paris, 1764; together with an explanatory memoir. 173. On the Equation of Time, *Recueil pour les Astronomes*, 1765.

174. He undertook the mathematical department of the *Journal des Savans*, from 1766. 175. On the Coins of Piedmont, *Journ. Sav.* Dec. 1767. 176. *Voyage d'un François en Italie*, 8 vols. 12mo: a correct guide and faithful repertory for travellers, containing some scientific information, besides maps of the principal cities. 177. *Dissertation sur la Cause de l'Élévation des Liqueurs dans les Tubes capillaires*, 8vo, Par. 1778. 178. A Dictionary of Astronomy, in the *Encyclopédie d'Yverdon*, 56 vols. 4to, 1770–6. 179. *Abrégé d'Astronomie*, 8vo, Par. 1773, 1795; translated into various languages. 180. Notes on the Mondes Primitifs of Fontenelle, 24mo, Paris; often reprinted. 181. Notes on Bouguer's *Traité de Navigation*. 182. *Mémoire sur le Passage de Venus*, 4to, Par. 1773; with a life of Dr Bevis. 183. *Réflexions sur les Comètes qui peuvent approcher de la terre*, 8vo, Par. 1773. 184. *Lettre à Cassini sur l'Anneau de Saturne*, 8vo, Toulouse, 1773; a violent attack, which was speedily suppressed by the author. 185. *Ephemerides*, 3 vols. vii. viii. ix. Paris, 1774, 1792. This was a continuation of Lacaille's computations, containing also some detached articles of importance; for instance, Hampstead's Catalogue, in the eighth volume. 186. A Celestial twelve-inch Globe, Paris, 1775.

187. The astronomical articles in the Supplement of the Old *Encyclopédie*, about 1776; those of D'Alembert, in the body of the work, having been little more than extracts from Lémonnier. 188. To the *Encyclopédie Méthodique* Lalande contributed a Dictionary of Astronomy, making about one-third of the *Mathématiques*, 3 vols. 4to. They were principally extracted from his own astronomy; and the article Cadran, which is very elaborate, was originally intended for a fifth volume of that work.

189. *Traité des Canaux de Navigation*, fol. Paris, 1778. This

Lamarck. volume is principally descriptive, especially of the Canal of Languedoc. 190. Letter on the Variation of the Compass, as connected with the Temperature of the Earth, *Journ. Sav.* 1780, Sept. 191. Leçons d'Astronomie de Lacaille, 8vo, Par. 1780; with some Notes. 192. Astronomie, in *Bibliothèque des Dames*, 12mo, Par. 1786, 1795.

193. Letter on the name of the planet Herschel, *Journ. Sav.* 1789; objecting to "Uranus." 194. Description d'une Machine de M. Ramsden, 4to, Paris, 1790; the dividing engine, translated. 195. Account of nine Lalandes, *Journ. Sav.* Nov. 1791. 196. Journey to Mannheim in 1791, *Journ. Sav.* 1791. 197. On the Zodiac at Strasburg, *Journ. Sav.* 1791.

198. Abrégé de Navigation, 4to, Paris, 1793, with a full catalogue of works relating to the subject, and many useful tables. 199. A Journey to Mount Blanc, performed in 1796, *Mag. Encycl.* ii. iv., 433. 200. Histoire Céleste Française, i. 4. Par. 1801; containing the catalogue of stars begun by Dagelet, and continued by Michel Lefrançois Lalande, the nephew of the editor. 201. Continuation of Montucla's *Histoire des Mathématiques*, 2 vols. 4to, Par. 1802; making the third and fourth of that elaborate work, but not equally well digested and discussed with the original part. 202. Tables de Logarithmes, 18mo, Par. 1802. 203. Four Memoirs on Ceres, *Journ. Phys.* 1802. 204. Some articles in the *Necrologie des Hommes Célèbres*. He wrote, at different times, Accounts of the Lives of Vicoq d'Azry, Delisle, Commerson, Verron, Me. Lepaute, and Dubocage; and he had undertaken a life of Bucholz, a short time before he died. Commerson had complimented him by making a genus *Lalandia*, transgressing in his favour the classical canon of the botanists, to reserve such honours for the reward of merit in their own department.

205. Bibliographie Astronomique, 4to, Paris, 1803; with a history of the Progress of Astronomy from 1781 to 1802. This useful volume was printed at the public expense, under the auspices of François de Neufchâteau. The author possessed a very extensive collection of astronomical books, and it has been regretted that he did not insert a more complete account of some of the most rare; but the work is already sufficiently voluminous. Some other productions are attributed to him in the *Dictionnaire des Anonymes*; but they would probably have added little to his fame had they been acknowledged.

(Delambre, *Mém. Inst.* viii., 1807. H.P. 30; and Biographie Universelle, xxiii., 8vo, Paris, 1819. Ma. C. de Salm, *Magas Encycl.* 1810, ii., p. 288; including a sketch by himself, written in 1804.) (T. Y.)

LAMARCK, JEAN-BAPTISTE PIERRE ANTOINE DE MONNET, Chevalier de, the celebrated French naturalist, was born of a noble family, at Bazentin, in Picardy, in 1744. Destined by his father for the church, he received the elements of his education in the Jesuits' College at Amiens, where he was distinguished by his abilities and ardent thirst for knowledge; but at the early age of seventeen he relinquished all thoughts of an ecclesiastical career, entered the army, and was attached to the division of the Duc de Broglie, during his contest with Prince Ferdinand of Brunswick, in Westphalia. The young Lamarck exhibited great courage, and received a severe wound in battle; but, on account of impaired health, he was soon compelled to retire from the service.

He then commenced the study of medicine at Paris; but the bent of his mind was to the physical sciences, and he made considerable proficiency in natural philosophy and botany. His first publication was entitled *Recherches sur les Causes des Principaux Faits Physiques*, in which he propounded theories of heat and electricity, which were more fully developed in his subsequent publication, *Mémoires de Physique et de l'Histoire Naturelle*, but which would have been forgotten had it not contained the germ of his speculations on animal life. In 1778 he sent to the Académie des Sciences some ingenious observations *On the Formation of Clouds*; and in the same year he was appointed, through the friendship of Buffon, assistant to Daubenton, in the Cabinet du Jardin du Roi, and was sent, with the son of his patron, into Germany and Holland, to collect rare specimens of plants for the royal collection. More fortunate than his companion, Lamarck survived the horrors of the Revolution, in which the young Buffon fell a victim to the butcheries of Robespierre.

In 1780 Lamarck produced his *Flore Française*, and

undertook to furnish the article *Botanique* for the *Encyclopédie Méthodique*. The first volume of that article appeared in 1783, and a second in 1786; but the Revolution put a stop to his progress in the work, which reached no farther than GOR in the alphabetic arrangement.

It does not appear when he first directed his attention to zoology, but he must have made considerable progress in that science before the Revolution, for in 1793 he was appointed one of the conservators of the superb museum of natural history at Paris, and the care of the invertebrate animals was confided to him. In 1794 he began to give lectures on that branch of zoology, and continued to do so until 1818, when age, and the failure of his sight, rendered him incapable of that duty, and he resigned his office to Latreille, Cuvier's assistant in the entomological department of the *Règne Animal*.

The first result of Lamarck's researches in his department of the museum appeared in a volume termed *Système des Animaux sans Vertèbres*, published in 1801, which may be considered as the forerunner of his great work on this subject, one of the most valuable treatises which has ever appeared on this difficult branch of natural history.

In 1809 he produced his *Philosophie Zoologique*, in two volumes, containing much that is exceedingly valuable; but we here find stated fully the extravagant hypothesis, broached in his *Recherches*, of the progressive development of animal functions, and the production of new organs, by the exertion of the WILL of the individual. This opinion is best given in his own words: "La production d'un nouvel organe dans un corps animal, résulte d'un nouveau besoin survenu, qui continue de se faire sentir, et d'un nouveau mouvement que ce besoin fait naître et entretenir." "Tout ce qui a été acquis, tracé ou changé, dans l'organisation des individus pendant le cours de leur vie, est conservé par la génération, et transmis aux nouveaux individus qui proviennent de ceux qui ont éprouvés ces changements."

The example which he adduces to support this strange doctrine is that of a molluscan gastropod. A snail, for instance, as it draws itself along, he imagines to feel the want of organs for examining the bodies it encounters, and therefore makes efforts with some of its anterior parts to touch those opposing bodies, by which exertion of its will, constantly operating, portions of nervous and other animal fluids must be determined towards its head; such reiterated efforts will in time, he says, cause two or more tentacula to spring from its head; "and this, without doubt, has happened to all races of gastropods, in which necessity has induced the habit of touching bodies with some part of their head!" Were this view to be received as the cause of changes in animal organization, the different species and genera, and even classes of animals, would long ago have been undistinguishable by diversity of organs; and the same laws, applied to the higher animals, would lead to the belief that terrestrial creatures may have derived their origin from the desire of aquatic animals to enjoy atmospheric existence; and even man himself might have passed, by long-continued appetite, from the form of a fish, or may hereafter obtain the wings of a bird!

The work on which the fame of Lamarck justly rests is his admirable *Histoire Naturelle des Animaux sans Vertèbres*, which successively appeared, in seven volumes 8vo, between the years 1815 and 1822. In this work he has founded his classification more on differences in anatomical structure than any of his predecessors in the same branches of zoology, and has therefore succeeded in a more perfect distribution of invertebrate animals. He divides the whole animal kingdom into three primary groups, which he denominates the *Apathetic*, the *Sensible*, the *Intelligent*. In the first he includes the classes—1. Infusoria, 2. Polyparia, 3. Radiaria, 4. Vermes; in the second, 5. Insecta, 6. Arachnidæ, 7. Crustacea, 8. Annelida; 9. Cirripeda, 10. Mol-

Lamas. lusca; in the third he includes, 11. Pisces, 12. Reptilia, 13. Aves, 14. Mammifera. The two first groups comprehend those treated of in this work, and his divisions are in general very judicious, though we must object to his term *apathetic* as applied to his first group.

The doctrine of *appetence* is again stated in the introduction to this work; and, to support his views on this subject, he maintains that the animals of former geological epochs were less perfect in their structure than their existing congeners; but surely the curious forms of fishes described by M. Agassiz as occurring in the oldest strata containing vertebrate remains are as perfect as those of any existing species; and the elaborate sculpture on the dermal plates of the extinct genera *pamphractus*, *cephalaspis*, or *asterolepis*, or the mechanical contrivance by which the armour of the *pterichthys*, or the scales of ganoid and ctenoid fishes of the former world are fitted to their bodies, or the groovings on the remarkable remains termed *ichthyodurooliths*, do not exhibit any mark of less perfect workmanship than we find in the existing creation.

Nor can we subscribe to his ideas regarding some of the apathetic animals (as he terms them). The infusoria he represents as destitute of a mouth or a digestive apparatus, and as nourished merely by *imbibition* through pores on their bodies, as wholly without a *will*, and as moving only by the action of external forces on their irritability. But the researches of Ehrenberg have proved that infusoria are more numerous, and more complex in their organization, than had been before imagined. In Ehrenberg's first class, *polygastrica*, he has described 552 species; and in the second, *rotatoria*, 170; or in all 722 well ascertained species. In the first class he has ingeniously proved the existence of a very complicated digestive apparatus, especially in the genera *vorticella*, *epistylis*, and *opercularia*, and in one of these no less than 120 stomachs or ventricular appendages; while in the class *rotatoria* he has detected eyes in 150 species. Ehrenberg has shown that they swallow food with avidity, and evidently make choice of certain aliment in preference to another, which is certainly an act of *volition*, while some of their movements are evidently produced by their *will*. In describing the *medusaria*, a tribe of radiate animals, Lamarck asserts that they are destitute of control over their own movements, "being without the possibility of directing them." This, however, we have ascertained to be incorrect, by experiments made purposely to ascertain this point. On a calm day, on the Clyde, opposite to the Cumbræ, we anchored a boat where *medusaria*, especially *Ephyra simplex* and *Cyanea cyclonota* abounded, and saw them repeatedly change the line of their progression, when slightly tapped on the apex of their *umbrella* with a fishing-rod. The motion was sometimes downwards, sometimes upwards, or horizontal; and we succeeded even in thus causing them to stem the gently flowing current of a commencing flood-tide by the contractions of the edges of their disks.

Notwithstanding these objections to some of the hypothetical views of this able philosopher, we consider that this great work of Lamarck has most materially contributed to the advancement of zoology. He will ever be considered as one of our great luminaries on the INVERTEBRATA, especially in the five classes of what he terms the *sensible* animals; and the second edition of it, with the notes of Deshayes and Milne-Edwards, of 1835-45, is the best existing manual of the general subject in any language.

Lamarck's last scientific labour was his *Mémoires sur les Coquilles*, in the *Annales du Muséum*, a very valuable treatise on shells, in which he was assisted by Valenciennes and his daughter Mademoiselle Lamarck.

M. Lamarck died at Paris in 1829, in the eighty-sixth year of his age.

(T. S. T.)
LAMAS, or Buddhist priests of Tibet. See TIBET.

LAMB, CHARLES, an original and delightful English essayist and humourist, was born in London on the 10th of February 1775. His parents were poor, but stamped with nature's nobility. His father filled the situation of servant and humble companion to one of the benchers of the Inner Temple, and he obtained for his son Charles, the youngest of three children, a presentation to Christ's Hospital, or the Blue-Coat School. At this ancient and munificent endowment, which maintains, in the heart of the metropolis, 1000 boys, clad in the old costume of its founder, Edward VI., Lamb remained from his seventh to his fifteenth year. He had the good fortune to have for a schoolfellow the celebrated Samuel Taylor Coleridge; and the influence of Coleridge on his younger and more timid associate was great and lasting. A close and tender friendship was formed between them, literary enthusiasm was communicated, and an object or example of successful study and lofty ambition was constantly present to Lamb's imagination. On quitting school, Charles was condemned to the labours of the desk. From 1792 to 1825 he officiated as one of the clerks in the accountant's office of the East India Company. His appointment was small at first, but gradually increased in value and importance, and he finally retired with a pension equal to two-thirds of his salary, or with the liberal allowance of L.450 per annum. During his thirty-three years of uncongenial toil and confinement Lamb never forgot literature. His evenings were devoted to a few favourite authors—the old dramatists, and other quaint or grave sources of "English undefiled,"—to an occasional visit to the theatres, when tragedy was represented by a Kemble, Siddons, or Kean, and the comic muse found joyous expression in Banister, Munden, or Liston; to correspondence with Coleridge; and to efforts, for many years slow and hesitating, at original composition. A sad calamity seemed to blight all his prospects in the very morning of life. There was insanity in his family, and, on the 22d of September 1796, his sister Mary Lamb, "worn down to a state of extreme nervous misery by attention to needlework by day, and to her mother by night," broke out into frenzy, and with a knife pierced her mother to the heart. Charles was at hand to snatch the knife from her grasp, and the unhappy and unconscious author of the fatal deed was placed in an asylum. Reason was gradually restored; and in a few months after the death of their aged father, Charles engaged to take care of his sister for life, and she took up her abode with him. His income at this time did not exceed L.100 a-year; he had to abandon all hopes of marriage, though then only twenty-two years of age; and there was the fearful and constant apprehension of the recurrence of his sister's malady. In fact, the malady did frequently recur throughout her after life. Mary Lamb knew, on each occasion, when the attack was approaching; and Charles, obtaining leave of absence from the office, *as if for a day's pleasure*, might be seen escorting his sister, both in tears, to the accustomed asylum in the neighbourhood of London. No more melancholy incident, and no nobler sacrifice, is recorded in literary history. To us it is more deeply affecting than the madness of Tasso, or the wild delirium of Scott.

Lamb's first appearance as an author was made in 1797, when he contributed some pieces to a small volume, consisting chiefly of poems, by Coleridge and Lloyd. Next year he published a prose tale, *Rosamund Gray*; and in 1799 he was associated with Coleridge and Southey in the publication of a volume of fugitive poetry, entitled *The Annual Anthology*, which was ridiculed by Canning in the *Anti-Jacobin Magazine*:—

"And ye five other wandering bards, that move
In sweet accord of harmony and love,
Coleridge and Southey, Lloyd, and Lamb, & Co.,
Tune all your mystic harps to praise L'epaux!"

Lamb,
Charles.

Lamb,
Charles.

Of the French democrat Lepaux, Lamb had not even heard the name before, and he was the least mystic of writers, either in prose or verse. But he was associated with Coleridge and Southey; and the youthful Canning, in his witty malice and anti-Jacobin zeal, was not disposed to make nice distinctions. Lamb's next literary venture fared no better, though the assault was this time made by a Whig critic. In 1801 appeared his *John Woodvil*, a slight dramatic piece, written in the style of the elder Elizabethan dramatists, and containing some genuine poetry and happy delineation of the gentler passions, but deficient alike in vigour, in plot, and character. The play was seized upon by Jeffrey in the *Edinburgh Review*, and held up, in a strain of ridicule, as a specimen of the rudest condition of the drama, the work of "a man of the age of Thespis." The dramatic spirit, however, was not quenched in Lamb. His next effort was a farce, named *Mr H.*, the point of which consisted in the hero's anxiety to conceal his name, "Hogsflesh,"—a plot so trivial, and so disappointing to the audience, who had yawned through the first act, imagining some great or witty disclosure was to follow, that the piece was sealed with instant and irrevocable condemnation. Lamb made no farther attempt in the difficult walk of the drama, in which many greater spirits have failed, but he bore the disaster with rare equanimity and good humour. He laughed it off among his friends, corresponded largely with a few choice early associates, instituted Wednesday evening suppers, at which shone many bright and subtle intellects, and at length struck into new and successful fields of literary exertion. In 1807 appeared *Tales founded on the Plays of Shakspeare*, written by Charles and Mary Lamb; and in 1808 two volumes of *Specimens of the Dramatic Poets*, with short but felicitous notes. Mary Lamb, in 1809, published a little tale, *Mrs Leicester's School*, and *Poetry for Children*. The establishment of the *London Magazine*, in 1820, formed a great era in the history of Charles Lamb. Many of his friends were connected with the new periodical, and he was stimulated to the production of a series of essays, signed *Elia*, which rose into instant popularity, and may be said to form the chief corner-stone in the small but classic temple of his fame. His curious reading and research—the shrewd observation, fancies, and conceptions of his whole life—were poured into these monthly essays, with many scenes drawn from his past career—its mirthful and mournful experiences. The style is quaintly elaborated, cut into short sentences, the grotesque mingling with the pathetic, and much practical wisdom with a dash of antic folly. In some of the essays, topics of humble and domestic life are set off with lively illustrations, fine satire, or graceful description; others are devoted to criticism, and remarks are thrown out at once original and profound. Perhaps nothing so suggestive or striking in this department of literature had appeared since the days of Steele and Addison. Lamb wrought on a limited canvas, but his combinations and colouring were unique and exquisite. In adding, from time to time, to the number of these essays, gratifying his friends occasionally with a fragment of prose, a letter, or a copy of album verses, Lamb's future days were spent. He was easy—nay, opulent—in his circumstances, and his reputation was daily extending. The unfortunate malady of his sister, however, broke in painfully on his lettered ease and comfort. It continued to increase, with shorter intervals of relief, and Lamb removed to the quiet of the country, residing successively at Islington, Enfield, and Edmonton. He had little enjoyment at any time in such suburban retreats; he would have preferred London to all the charms of Arcadia and the golden age; and he frequently stole in to the Great Babel, to listen to its welcome roar, and pass a festive evening with his friends; this only, however, when Mary was well, and she often accompanied him.

They lived on at Edmonton until Lamb was overtaken by an attack of erysipelas, induced by an accidental fall while walking on the London road, and in a few days the disease proved fatal. He died on the 27th of December 1834. His sister survived till 1847. The sudden death of one so widely known, admired, and beloved as Charles Lamb, fell on the public, as well as on his own attached circle, with all the poignancy of a personal calamity and private grief. His memory wanted no tribute that affection could bestow, and Wordsworth commemorated, in simple and solemn verse, the virtues and genius, and the fraternal devotion, "passing the love of woman," of his early friend. His letters were collected, and his life written, by one of his executors, Sir Thomas Noon Talfourd, and another friend. Mr Edward Moxon, the publisher, has given to the world several complete editions of his works. (R. C.—S.)

LAMB, William, Lord Melbourne, was born in London in 1779. Having received his university education, first at Trinity College, Cambridge, and afterwards at Glasgow, he entered as a student at Lincoln's-Inn in 1797, and was called to the bar in 1804. In the following year he married Lady Caroline Ponsonby, who afterwards became celebrated for her literary talents. In 1805 he entered the House of Commons, and joining the opposition, then led by Fox, he supported that side, without earning any celebrity, during 20 years. On the death of his father in 1828, he succeeded to the title of Viscount Melbourne, entered the House of Lords; and in 1830 became home-secretary, under the administration of Lord Grey. This office he filled till 1834; and in the following year was raised to the Premiership, which he held with great ability till 1841. He died in 1848, in his seventieth year. Possessing no eloquence, and little practical sagacity, Lord Melbourne owed the strength of his government mainly to his personal tact, frankness, and ingenuity; and his premiership is marked by no great event in the political history of the kingdom, the main energies of his party being spent in clinging to office after the reality of its power was gone.

LAMBALLE, a town of France, department of Côtes-du-Nord, on the Gouessant, 12 miles E. by S. of St Briac. It is surrounded by old walls; and has manufactures of woollen, linen, leather, &c., and some trade in agricultural produce. Pop. about 4500.

LAMBERT, JOHN, was born September 7, 1619, in the parish of Kirkby-Malhamdale, in the West Riding of Yorkshire, at Calton Hall, the seat of a family of which he was the representative, and which traced its descent from a daughter of the Conqueror. That his father died when he was thirteen years of age, that he married, when in his twenty first year, a daughter of Sir William Lister, his neighbour, and that he studied the law in an inn of court, but never pursued it as a profession, is all that we find recorded of his early years. When the civil war broke out, he commenced his military career as captain in the parliamentary forces under Fairfax. In the following year we find him bearing the rank of colonel; and the earliest exploits in which he is known to have distinguished himself were—a sadly from Hull on the 11th of October 1643, by which he obliged Lord Newcastle to raise the siege; an engagement at Bradford on the 5th of March 1644, wherein he defeated Colonel Bellasis; and the pursuit of this officer and his troops to Selby, which, being joined by Lord Fairfax, he stormed and took on the 11th of April. The siege of York by the combined forces of Lords Fairfax, Manchester, and Leven ensued; and on the 2d of July, the eventful fight of Marston Moor, in which, along with Sir Thomas Fairfax, he had command of the parliamentary cavalry. The siege of York was recommenced by the victorious army, and Lambert was sent in to a parley with the governor, which ended in the surrender of that city. In January 1645, he was appointed commissary-

Lambert,
John.

general of the northern army; twice in that year beat the royalists at Keighley and Ferrybridge; and the garrisons of Scarborough, Pomfret, Sandall, Sherborne, Bolton, and Skipton, surrendered to the parliament. In the commencement of 1646 we find him engaged under Fairfax in the west, in subduing the last remnants of the royalist forces in that quarter: we find him at the sieges of Dartmouth, of Truro, and of Exeter, which surrendered, the first on the 20th of January, the second on the 14th of March, and the last on the 9th of April; after which he marched with the army to the siege of Oxford, and was one of the commissioners who negotiated the surrender of that important city, of which he was appointed governor. He was afterwards made one of a select council of five (his colleagues being Cromwell, Ireton, Fleetwood, and Whitelocke), to consult on the disposal of the parliamentary forces for the reduction of the few garrisons which still maintained the authority of the king.

In the struggles for ascendancy between the parliament and the army, in 1647, Lambert brought his legal knowledge and training to bear in advocating the cause of the latter. He was one of the commissioners who, on the 2d of July, attended at High Wycombe, to treat with commissioners from the parliament, and prepared the proposals for the settlement of the kingdom, which they submitted to the parliamentary commissioners at Colnbrooke, on the 3d of August. After delivering these proposals, Lambert was sent into Yorkshire as major-general of the four northern counties. In 1648 he defeated Langdale and Musgrave near Carlisle; and afterwards, along with Cromwell, the combined Scottish and royalist troops, numerically more than twice as powerful as the parliamentary forces. He then followed Cromwell into Scotland, and after a short stay at Edinburgh marched back into England to reduce Pomfret, a strong fortress which the royalists had seized anew. Before this place he arrived in December 1648, and here he remained till after the trial and execution of Charles; events in which he bore no part, and of which we have no evidence of his having approved. Pomfret surrendered soon afterwards; and the parliament, on receiving this intelligence in March 1649, voted thanks to him, and a grant of lands out of the demesnes of Pomfret, of the value of L.300 a-year. When Cromwell became generalissimo of the parliamentary forces Lambert was at the same time made second in command; and the two generals, in June 1650, marched towards Scotland, where Charles II., who had been acknowledged in that portion of his dominions, was at the head of a large army. In a gallant but indecisive action near Musselburgh he was wounded, his horse killed, and himself for a while in the hands of the enemy, but was rescued by his troops. At the battle of Dunbar he led the van, and in the July of 1651 defeated above 4000 of the king's troops at North Ferry, and obtained minor successes in the course of the same month at Inchgarvey and Burntisland. When Charles, after these actions, embraced the bold resolution of marching upon London, Lambert hastened in pursuit, engaged the royal army at Warrington, joined Cromwell at Warwick, and, on the 3d September, took part in the battle of Worcester, where the hopes of the royalists were for a time completely overthrown. After the engagement, parliament voted "that lands of inheritance in Scotland, to the yearly value of L.1000 sterling, be settled upon Major-general Lambert and his heirs, for his great and eminent services for this commonwealth." In the winter of this year, he was made a commissioner, together with Monk, Vane, St John, and four others, for the settlement of affairs in Scotland, where he remained a very short time, being, on the death of Ireton, appointed by the parliament, in January 1652, to succeed him as lord-deputy of Ireland. But the term of this office was limited to six months, and Lambert, filled with displeasure against the parliament, declined the proffered post.

Lambert,
Johann
Heinrich.

In the events which led to the assumption of the supreme power by Cromwell as lord-protector, he took a leading part; and in the new parliament, taking his seat as member for the West Riding of Yorkshire, consistently carried out his political views. He vehemently opposed the idea of investing Cromwell with the title of king; and though the offer of that title was carried in parliament, his opposition, and the murmurs of the army, with which he had much influence, induced Cromwell to decline it. When the lord-protector accepted all the other attributes of royalty, on his second inauguration, May 12, 1657, Lambert, in disgust, refused to take the oath of fidelity to the protector; gave up his commissions, which brought him a yearly income of L.6000, and retired on a pension of L.2000. On the accession of Richard Cromwell, and the meeting of a new parliament in January 1659, he was elected for Aldborough and Pomfret, and took his seat for the latter. The next twenty months were the most active period of his life. He became the life of the extreme republican and independent party, known as the "Fifth Monarchy men;" and it was chiefly by his efforts that Richard Cromwell was deposed. But his party felt that it was dangerous to attempt to govern without some semblance of civil administration; so the members of the long parliament, excluded by Cromwell in 1653, were invited to assemble; and this remnant, ridiculed under the name of "the Rump," met as a parliament on the 7th of May. Order was for a while restored; but the royalists were encouraged, by the state of the country, to make a bold effort for the restoration of Charles. Lambert was commissioned to suppress the insurrection, which he did easily and effectually at Nantwich. His influence with the army now made him an object of dread and suspicion to the parliament. On a rash motion of Hazlerig, that he should be sent to the Tower, he instantly dissolved the house, as Cromwell had done before; and the chief power again reverted to the small but formidable faction of which Lambert was the soul. Meanwhile, Monk commenced his celebrated march from Scotland, with the intention of restoring the power of the parliament. Lambert set out to meet him at the head of 7000 men, but in his absence the power of his party began to crumble away; the Rump resumed its authority, and one of its first acts was to disband Lambert's forces, and order him to return to his own house. Desertion had thinned his ranks; to resist was useless; he obeyed, and being thought too dangerous and powerful to remain at liberty, was soon afterwards committed to the Tower. In April, when Monk had almost withdrawn the mask, and appeared as the restorer of monarchy, the republicans again turned their eyes towards Lambert. Apprized of their wishes, he escaped from the Tower, and hastened into Warwickshire, where, on the 13th of April, he placed himself at the head of six troops of horse, and several companies of foot. He was met near Daventry, on the 21st, by an equal force, under the command of Ingoldsby. His soldiers refused to fight; and he was captured and again committed to prison.

After the restoration of Charles II., Lambert, though not a regicide, was excepted out of the bill of indemnity. He was tried along with Sir Harry Vane, found guilty, and condemned to death; but his punishment was commuted to imprisonment for life in the island of Guernsey. He remained in that island till his death, which occurred about thirty years afterwards. The favourite pursuits of his later years were botany and painting. It does not appear that he devoted any part of it to literature, or left any record of the great events in which he had been engaged.

(See Whittaker's *History of Craven*; May's *History of the Parliament*; Whitelock's *Memoirs*; Ludlow's *Memoirs*; Clarendon's *History of the Rebellion*, and *Life of Himself*; Rushworth's *Collections*; *State Trials*.) (T. H. L.)

LAMBERT, Johann Heinrich, a natural and moral philoso-

Lambert. pher of great talent and originality, born on the 29th of August 1728, at Mülhausen, in Upper Alsace, was the son of a French refugee in a very humble station, and one of a numerous family.

His early studies were only assisted by the instruction he obtained at a small free school in his native town. His father, who was a tailor, could scarcely even afford him leisure from mechanical labour. He was obliged to read and write in the night; and, in order to procure candles, he made little drawings for sale, while he was watching the cradle of his infant sisters. Having learned to write a good hand, he obtained some employment as a copying clerk in the chancery of the town, which he gave up when he was only fifteen, upon being appointed book-keeper at some iron-works in the neighbourhood. At seventeen he became secretary to a Doctor Iselin, who was the editor of a newspaper at Bâle, and who became his firm friend through life. He had now time to render himself familiar with the works of Wolf, Locke, and Malebranche, to which he was in a great measure indebted for the correct logical method that he ever afterwards followed in his researches; having, however, confirmed and improved it by the study of the mathematics, to which he devoted himself with great zeal, and which, after all, constitutes the best practical school of genuine logic.

In 1748, he removed to Coire, having been recommended by Iselin, as private tutor to the family of the president, Count Peter de Salis, whom he undertook to instruct in history and religion, as well as in languages and science. The library of his patron was extensive; he profited by it in all its departments; and his residence at the house of an accomplished statesman, frequented as it was by the best-informed persons of different countries, and with different pursuits, could not but greatly contribute to the extension of his knowledge, and the improvement of his taste. He even amused himself with some poetical exercises in various languages, which must, at least, have been of advantage to his style in prose. He felt the importance of his literary and scientific pursuits to himself and to the world; and in 1752 he determined to keep a journal of all his studies, which he continued throughout his life. He began to publish a variety of fugitive pieces, on different subjects, in the newspapers and in other periodical works of the day, some of which attracted the notice of his learned countrymen; and, in 1754, he was made a member of the Physico-Medical Society, then lately established at Bâle, to the Transactions of which he contributed many interesting papers. In 1756 he went to Göttingen with two of his pupils, and in 1757, to Utrecht. The next year the party returned to Coire, by way of Paris, Marseilles, and Turin. At Paris he paid a visit to D'Alembert, who does not appear at that time to have appreciated his merit very highly, though he afterwards rendered him some services with the King of Prussia; but he became more intimately acquainted with Messier the astronomer.

In 1759 he quitted the family of the Count de Salis, and went to settle at Augsburg, having a small salary as a member of the Electoral Academy of Bavaria. From 1761 to 1763 he was again at Coire and in its neighbourhood, being employed in fixing the boundaries between the country of the Grisons and the Milanese territory. Towards the end of 1763, having had some disputes with the Bavarian academicians, he went to Leipzig, and the next year to Berlin, where he was made a member of the Royal Academy of Sciences, and where he continued to reside during the remainder of his life, receiving many marks of favour from the discriminating liberality of Frederick: thus, in the year 1770, he was made superior counsellor of the Board of Works, with an additional salary. He contributed a number of valuable memoirs to the collection of the Academy; and in 1774 he undertook the di-

rection of the *Astronomical Almanac*, for which he was admirably qualified. He was also a constant writer in the journal published by Nicolai, under the title of the *Universal German Library*; and he kept up a very extensive correspondence on various subjects of literature and science.

He was regularly in the habit of writing or reading from five in the morning till twelve, and again from two till midnight; a degree of application unquestionably far beyond that which would have been best calculated for producing the maximum of valuable effect. Perhaps, if he was paid for writing by the ream, he may have earned as much from the booksellers as he would have done by a more judicious economy of his powers; but a nervous system, attenuated by the daily study of seventeen hours, could never have been capable of being employed in any very elevated flights of genius, or in the invention of any sublime or exquisite novelties, either in science or in literature; and it is only wonderful that he did anything so well, as almost to form an exception to this general remark. He was indeed supposed to have injured his health by continued application, and he died consumptive, on the 25th September 1777, at the age of forty-nine. He had never been married. His person was of the middle size, with an interesting and expressive countenance; he was animated and lively in conversation, and liked discussion, but not disputation. He had no literary quarrels; and his criticisms were not offensive, even when they ceased to be flattering. His morals were strictly correct, but his manners were not altogether in unison with those of the society to which his talents had elevated him. He is said to have been timid, awkward, slovenly, and fond of low company; but upright, patient, unostentatious, and compassionate; essentially modest, but as ready to assert his own merits as to admit his defects. He had a happy facility in managing the instruments of computation, especially in the arrangement of converging series; and he had a peculiar talent for expressing the results of observation by an analytical formula, having first thrown them into the form of a geometrical diagram to assist his invention; a process which he employed with regard to the probabilities of life in London, and to the inequalities of Jupiter and Saturn. In short, after Euler, Lagrange, D'Alembert, and Daniel Bernoulli, there are few mathematicians and natural philosophers of any age who can be put in competition with him, and still fewer who benefited the public by so many diversified labours.

It would be hopeless to attempt to pursue his indefatigable pen through all its wanderings: and a complete catalogue of his works would be as useless as it is unattainable. A man who wrote so incessantly must have written many things which were destined to oblivion from their first production. It will be sufficient to mention the most remarkable of his works, without any very strict regard to the priority of their publication.

1. In the *Acta Helveticae of the Society of Bâle*, ii. 1752, we find an Essay on the Force and Measurement of Heat, a subject which the author resumed in the latter part of his life. 2. A General Series, somewhat resembling Taylor's, *Act. Hel.* iii. 1758. 3. Meteorological Observations, *ibid.* 4. He also published a paper on the Vibration of Chords, in the same collection.

5. *Les Propriétés les plus Remarquables de la Route de la Lumière par les Airs, et en général par plusieurs milieux Réfringents*, Hague, 1759, in 8vo; German by Templehof, Berl. 1773. This work does credit to the ingenuity and mathematical abilities of the author, though its results may be obtained in a simpler manner by some methods more recently invented.

6. *La Perspective Libre*, Zurich, 1759, 8vo; another edition in German. The second German edition, 2 vols. 8vo, Zurich, 1773, contains some additional matter, especially a system of geometry, depending, as it is said, upon the ruler alone, without any other instrument. Such a system must, however, have been extremely limited in its application, much more so than Mascheroni's *Geometria del Compasso*.

7. *Photometria, sive de Mensura et Gradibus Luminis, Colorum, et Umbrae*, Augsb. 1760, 8vo. This original and interesting volume includes and supersedes the greater part of Bouguer's experimental determinations. It contains the important discovery, that a lumi-

Lambert.

Lambert. nous surface emits its light with equal intensity in all directions; together with some improvements in the theory of twilight, and an investigation of the comparative light of the sun and moon, and stars and planets.

8. *Insigniores Orbitæ Cometarum Proprietates*, Augsb. 1761, 8vo. We here find the elegant theorem for expressing the relation of the area of a sector to the sides of the triangle inscribed in it. This theorem had been demonstrated with respect to the parabola by Euler in 1740: but Lambert first extended it to the other conic sections, and he certainly re-invented the whole, without being aware of what Euler had done. It may be found, together with a concise demonstration, and a further account of this work, in the translation of Olbers' *Essay on Comets*, published in the *Journal of the Royal Institution*.

9. *Cosmologische Briefe*, Augsb. 1761, 8vo. A French translation of these Letters on the Universe appeared in the *Journal Helvétique de Neuchâtel*, 1763-4; an extract was published by Merian, with the title of *Système du Monde*, Bouillon, 1770, Berlin, 1784, in 8vo; and a translation by Darquier appeared at Amsterdam, 1801, in 8vo. The whole work is written in a popular style, and adapted to the taste of general readers. The author's favourite idea was to make the sun a sort of planet, revolving round some other great body; and he supports the opinion by an argument derived from the supposed insufficiency of the laws of gravity, as relating to the solar system, for explaining some of the inequalities of the motions of Jupiter and Saturn, which have, however, since been reduced to the general analogy by Lagrange and Laplace.

10. *Zusätze zum Traité de Nivellement Von Picard*, 12th August 1761, explaining some improvements on Picard's level, executed by Brander, an ingenious artist, whom Lambert also assisted in the improvement of Gunter's sliding rule. 11. He published an explanation of this scale, entitled *Logarithmische Rechenstäbe*, 12th August 1761.

12. Remarks on Incommensurable Quantities, *Mém. Ac. Berl.* 1761. A demonstration of the incommensurability of the circumference of a circle to its diameter, which has been adopted by Legendre in his Geometry. It depends on the method of reducing a fraction to its lowest terms, as laid down by Euclid, and on the properties of continual fractions; an expression is obtained for a tangent in terms of the arc from the quotient of the series for the sine and cosine, and the continual fraction thus obtained is proved to be infinite. It is also shown that the ratio of the arc to its tangent can never be expressed by any finite quadratic surds. 13. On the Specific Gravity of Salt, and of its Solutions, *M. Berl.* 1762.

14. *Novum Organum*, Leipzig, 1763, in German, two vols. 8vo. An attempt to restore and improve the Aristotelian method of syllogism, in which the author is allowed to have displayed much ingenuity, though its success was greatly limited, on the one hand, by the sober good sense of the empirical reasoners of the school of Bacon and Locke, and on the other, by the wild enthusiasm of the German innovators, who were beginning to be intoxicated with the high-sounding phrases and exaggerated pretensions of the disciples of Kant. A manuscript Latin translation of the work, by Pfeiderer, was once in the possession of the late Lord Stanhope.

15. A paper on Trigonometry appears in the *Nova Acta Eruditorum* for 1763. 16. In the *Berlin Memoirs* for the same year, we find an Essay on Acoustic Instruments, investigating the best forms for hearing-trumpets. 17. Remarks on the Properties of Equations of all Degrees. 18. On Divisors of Equations, which may be found without solving them. 19. On some Measurements relating to the Intellectual World; that is, on probabilities and expectations.

20. *Beyträge zur Mathematik*, Berlin, 1765, 1770, 1772, in four vols. 8vo: a collection of essays on every department of mathematical science. The first volume contains Remarks on Trigonometry and on the Certainty of Observations: on the Divisors of Numbers, and on Annuities; the second, Tables of the Moon: an Essay on Dialling, and on Geographical Projections, with the Elements of Trigonometry, a subject which was afterwards resumed by the younger Mayer; in the third volume there is an Essay on Interpolation, Remarks on Celestial Maps, with other articles.

21. Description of a Table of Eclipses, *Berl.* 1765, with the easiest mode of computing them. 22. In the *Memoirs of the Academy of Berlin* for 1765, we have a paper on Projectiles, including the effect of resistance. 23. In those of the *Bavarian Academy* for the same year, some remarks on the Improvement of Terrestrial Measurements; and, 24. Meteorological Observations. 25. In the *Nov. Acta Erud.* for 1765, An attempt to employ Calculation in the Moral Sciences. 26. On the Magnet, *Ac. Berl.* 1766. 27. Another paper on Magnetic Currents. 28. A Magnetic Chart was published separately the same year. 29. Remarks on the General Outline of the Ocean, *Ac. Berl.* 1767. 30. A General

Solution of the Problem of Three Bodies by means of Series, *ibid.* 31. Notes on Richer's Philosophical Algebra, 1767.

32. Remarks on the Velocity of Sound, *M. Ac. Berl.* 1768; an unsuccessful attempt to reconcile the theory with observation. It was reserved for Laplace, by a single happy suggestion, to remove the whole difficulty. 33. On Photometry, as applied to Painting, *ibid.* 34. Trigonometrical Observations, *ibid.*

35. De Topicis Schediasma, 1768. 36. Remarks on the Divisors of Numbers, *Nov. Act. Erud.* 1769. 37. Anmerkungen über die Brander'schen Micrometern, Augsb. 1769. Brander's micrometers were of glass.

38. Experiments on Hygrometry, *M. Acad. Berl.* 1769; relating to evaporation, and to the indications of hygrometers, especially those of catgut.

39. *Supplementa Tabularum Logarithmicarum*, 8vo, *Berl.* 1770; with a valuable introduction in German, on the abridgment of computations.

40. Anmerkungen über die kraft des Schiesspulvers, 8vo, *Berl.* 1770. In this investigation of the force of fired gunpowder, the author attacks several points in the theory of Robins, published a few years before.

41. *Hygrométrie*, 4to, Augsb. 1770.

42. On Directors for the Light of Lamps, *M. Acad. Berl.* 1770.

43. On Ink and Paper, *ibid.* 44. Analytical Observations, *ibid.*; relating to the general theorem resembling Taylor's, which was further discussed by Euler, and modified by Lagrange. 45. On Taxeometry, or the Measurement of Order, *ibid.*; considered as comparable in degree, and expressible by numbers.

46. *Architectonik*, 2 vols. 8vo, Riga, 1771; a logical and metaphysical treatise on the most simple bases of philosophical and mathematical knowledge, written in 1763. The last part, which relates to magnitude, is the most approved; but the whole work was never much read, being partly superseded by the more ostentatious novelties of the day.

47. In the *Berlin Memoirs* for 1771, we find papers on Meteorology. 48. On the Atmospheric Influence of the Moon. 49. On Achromatic Telescopes of one kind of Glass only. 50. On the Apparent Paths of Comets. 51. On the Grounds of Superstitious Belief, as compared with Probability.

52. Ueber das Farbenpyramide, 8vo, *Berl.* 1772; a description of a pyramid of wax, intended for the illustration of all the possible varieties of combination of the primitive colours.

53. *Astronomisches Jahrbuch*, *Berl.* 1774-9, in 8vo; an accurate and extensive ephemeris, with many original communications annexed to it.

54. In the *M. A. Berl.* 1772, a paper on Friction; supposed to follow the law of the resistance of fluids, with some remarks on that resistance. The opinion of the uniformity of the force of friction, which was even at that time general, was somewhat too hastily rejected by the author; but his computations may still be of use in some cases. 55. On the Fluidity of Sand; as resisting motion. 56. On Hygrometry; continued. 57. On the Density of the Air, with respect to sound and to refraction.

58. *M. A. Berl.* 1773: A Ballistic Scale, for determining the paths of projectiles in the atmosphere. 59. Physical Observations, relating to Meteorology and to Optics. 60. On the Satellite of Venus; affording a remarkable instance of misapplied labour and ingenuity. 61. A Second Essay on Taxeometry. 62. A Note on the Inequalities of Jupiter and Saturn; intended to confirm the principles advanced in the Cosmological Letters. The detail was reserved for a subsequent volume.

63. *M. A. Berl.* 1774: On the Temperament of Musical Instruments. 64. On the Aerial Perspective. 65. Report on a Bedstead for Sick Persons.

66. *M. A. Berl.* 1775: On the Elasticity of the Air. 67. On Wind-mills, and on the Force of the Wind. 68. On the Sounds of Flutes; an elaborate comparison of the various tones of a flute, with the theory of Daniel Bernoulli for determining the sounds of compound organ-pipes.

69. *M. A. Berl.* 1776: On the Strength of Men employed in Labour. 70. On Imperfect Fluids.

71. *M. A. Berl.* 1777: On the Elasticity of the Air.

72. *M. A. Berl.* 1779: Two Memoirs on the Inequalities of Jupiter and Saturn.

73. *Pyrometrie*, 4to, *Berl.* 1779; a posthumous work, upon a subject which had long occupied the author's attention; with a Preface by Karsten, and a Biographical Memoir by Eberhard.

74. A Paper on Annuities, *Leips. Magaz.* 1780.

75. *Deutscher Gelehrter Briefwechsel*, *Berl.* 1781-7, in 5 vols. 8vo; published by John Bernoulli, and consisting principally of the author's correspondence with Holland, Kant, Karsten, Segner, Basedow, Scheibel, and Brander. The contents are more fully described by Lalande. *Bibl. Astr.* p. 584.

76. *M. A. Berl.* 1783: On Friction.

Lambert.

Lambourn 77. Logische und Philosophische Abhandlungen, Berl. 1787, in 2 vols. 8vo. Edited by J. Bernoulli.
 || 78. On the Theory of Parallel Lines, *Hinderb. Arch. der Math.* i.
 Lamen- (Bernoulli in *Nouvelles Littéraires*, 8vo, Berl. 1777; Eberhard in
 nais. *Pyrrometrie Briefwechsel*, iii., *Phil. Mag.* May 1804; Aikin's *General Biography*, vi. 4to, Lond. 1807; Servois in *Biographie Universelle*, xxiii., 8vo, Par. 1819.) (T. v.)

LAMBOURN (CHIPPING), a market-town of England, county of Berks, on a small tributary of the Kennet, 7 miles N.N.W. from Hungerford. The chief buildings are the parish church, an ancient cruciform edifice, a Wesleyan chapel, and several alms-houses. Pop. of parish (1851) 2577.

LAMEGO (the ancient *Lameca*, *Lamacum*), a town of Portugal, province of Beira-Alta, near the Douro, 46 miles E. from Oporto. It was the residence of the Moorish court till 1038, when it was captured and occupied by Ferdinand the Great of Castile. Here also the famous cortes of Portugal are supposed to have been held in 1143 or 1144. It is surrounded by a wall, and has a cathedral, founded by Count Henry, father of the first king of Portugal, about the middle of the fourteenth century; a church called Almacave, a college, a bishop's palace, a nunnery, three monasteries, and two hospitals. It is an episcopal city; and though of great note in former times, is now somewhat uninteresting. Pop. 9000.

LAMENNAIS, FELICITÉ ROBERT, ABBÉ DE, was the son of a wealthy shipowner, and born at St Malo in 1782. In the social troubles of the time, his education was neglected; but, learning the rudiments of Latin from his brother, he picked up the remainder as best he could, and with marvellous rapidity. At the house of an uncle, whither he was sent when about twelve years of age, he read philosophy and romance at will, until his mind, deepening in emotional and religious fervour, recoiled from all mercantile pursuits. In 1807 he became teacher of mathematics in the college of his native town, where his family had considerable influence. His first work, *Réflexions sur l'Etat de l'Eglise en France, pendant le 18^e Siècle* (pub. 1808), was mainly directed against the philosophy which he had so eagerly explored and devoured in his youth, and the baneful effects of which were felt everywhere in the religion of his country. Lamennais took the tonsure in 1811, but he was not ordained priest till 1816, having been banished during the Hundred Days for a violent pamphlet written against Napoleon I., and been compelled to earn his bread as usher in a school near London. His greatest work, the *Essai sur l'Indifférence en Matière de Religion*, was published soon after his return to France, and procured him the offer of a cardinal's hat from Pope Leo XII. It was his last service of faith to the Church of Rome. His love of civil liberty hurried him soon after into conflict with it, and his next volume, touching the relation of religion to civil and political order, subjected the "Second Bossuet" to a fine from the Cour Correctionnelle. This did not, however, deter him from pushing on to a solution of the problem, always a favourite one with the laity of France, how civil liberty can consist with religious despotism. A journal, called *L'Avenir*, was started to enforce his views, and for its vigorous and intrepid thinking, as well as its pure and eloquent style, it soon became a favourite with the democracy of the capital. With every one who had agitated the same question before, Lamennais was found to have rushed from the idolatry of absolute power to the idolatry of absolute individual independence. The complete separation of the temporal from the spiritual power he proclaimed as the only resting-place for his faith; universal suffrage as the only guarantee of his freedom. An encyclical letter from the Pope in September 1832, scattered the coterie of his admirers, who chose to be catholic rather than liberal; and the journal was allowed to drop, towards the close of that year. In 1834 he published his

Paroles d'un Croyant, which was condemned almost immediately after by Gregory XVI. Undeterred, Lamennais continued his labours, and while the liberal party in the church contented themselves with enforcing the claims of science and the freedom of literature in the milder pages of the *Université Catholique*, his pen was busy in the cause of revolution, with all the ardour of a man who felt that the bridge was broken down behind him. On his deathbed he resisted all the efforts used to make him retract, and chose to die unreconciled to the church (February 27, 1854). At his own request, no religious rites were performed at his grave. Certain papers, which he earnestly desired to be published, were detained by his relatives in their zeal for the church, but have recently been handed over to the person named for their publication. The spirit of Lamennais' philosophy is essentially ecclesiastical. He followed the path which M. de Maistre had opened up, stepping on a prostrate philosophy in the hope of substituting faith for knowledge, and authority for investigation. In the church of all ages, he finds the one great channel through which God has communicated truth to his creatures. To justify a retreat into this last sanctuary of philosophic despair, it is necessary to make good a thorough philosophic scepticism. This he makes a show of doing on philosophical grounds, but in reality wielding only a passionate misanthropy and mysticism, which can gain only the broken and dispirited in the pursuit of knowledge. Like all who have laboured in the same path, Lamennais seems to have been unconscious of the circle in which he was whirled, and blind to the principle, that philosophically to establish universal scepticism is equally valid to establish a scepticism against scepticism, as to establish a scepticism against philosophy itself. Having abandoned a criterion of truth for the individual, his only resort is to seek it in the race; and in the history of the human family there is but one unchanging element of truth,—one school of verity where doubt does not enter,—viz., the church. With the patriarchs, the palladium of truth was deposited, and the sacred treasure has been preserved by the Jews, to become, under the Christian dispensation, the exclusive property of the Catholic priesthood. The popedom is the living centre of universal consent. Although this is really a theology, it has been by Lamennais beautifully arrayed in the philosophic dress. This is the only secret of its influence. Lamennais may be said to have furnished the most powerful refutation of his scheme, when he advocated the independence of the clergy, and died a martyr to the truth of his own personal convictions. In his political struggles his philosophy vanished, and passed into the hands of De Bonald, Ballanche, and others of the same school, who have sought to seize on some primeval faith, and disentangle it from the doubts and questionings of a personal philosophy.

His published works not already mentioned are—*Les Affaires de Rome*, 1836; *Le Livre du Peuple*, 1837; *Le Pays et la Gouvernement*, 1840; *De la Religion*, 1841; *Le Guide du Premier Age*, 1846; *Une Voie de Prison*, 1846; *Les Conseils de l'Abbé Lamennais au Peuple*, 1849; and *Esquisse d'une Philosophie*, 4 vols. 1840-46. The *Paroles d'un Croyant* have been translated into English.

LAMIA, or ZERTUN, a town of Greece, capital of the government of Phthitis, is situate near the head of the Gulf of Volo, not far from the Turkish frontier. It is generally well built, and is said to bear a considerable resemblance to Athens. It has a citadel, barracks, and military hospital. Pop. about 4000.

LAMMAS, a festival held on the first day of August. Some suppose it to have derived its name from the practice of bringing a live lamb on that day to high mass, but this seems a mere local custom peculiar to York. Others regard it as equivalent to loaf-mass, or harvest offering of bread from new corn. A balder meaning is attached to it

Lamia
 ||
 Lammas.

Lammer-
moor Hills
Lamp.

by Johnson, who makes it a corruption of *Lattermath*, or *second-mouing*. The proverb "at latter Lammas," like the Roman *ad Græcas calendas*, is a euphemism for *never*.

LAMMERMOOR HILLS, a range of hills stretching from the S.E. extremity of Edinburghshire, through the counties of Haddington and Berwick, and terminating in the cliffs round St Abb's Head. The principal summits attain an elevation of nearly 1600 feet. The upland districts are used for pasturing sheep, but the cultivated tracts ascend pretty high along the lower slopes. See HADDINGTONSHIRE, &c.

LAMOTTE-FOUQUÉ, FRIEDRICH-HEINRICH-KARL, BARON DE, one of the modern poets of the romantic school, was born at Brandenburg, 12th Feb. 1777. His ancestors, who had been driven from France by the revocation of the Edict of Nantes, belonged to one of the most ancient families in Normandy; and his grandfather (Henri August Baron de Lamotte Fouqué), was a general in the Prussian service, had fought in the Seven Years' War, was wounded and taken prisoner at Landshut, and throughout the whole of his career enjoyed the intimacy and friendship of Frederic the Second. Entering the Prussian army at a very early age, the youthful Fouqué served as a lieutenant of cavalry in several campaigns; but at the peace of Basle retired to the country, and devoted himself to literature. About this time he published, under his assumed name of Pellegrinus, a translation of the *Numantia* of Cervantes, several dramas, the romance of *Alwin*, and *Die Historie des Edeln Ritters Galmy, und einer Schönen Herzogin aus Bretagne*. Hitherto he had been an imitator of Cervantes and Spanish writers; but now the Scandinavian literature, a taste for which had been revived in Germany, won his admiration; and in 1809 he published, under his own name, the poem of *Sigurd der Schlangentöchter*, in which the chivalry of the old northern romances is successfully copied both in spirit and life. In 1813 there appeared his masterpiece, *Undine*, a wild and supernatural tale, original in its conception, and told with great descriptive power and exquisite tenderness of emotion. It has been translated into all the languages of Europe. The same year summoned him from his studies to defend his country against the French. He fought valiantly in several battles, rose to the rank of captain, and, when attacked by ill health, retired with the title of major, at the time when the allied armies were about to cross the Rhine. He fixed his abode at Nennhausen, the property of his second wife Caroline, who was herself a popular novelist. In 1814 appeared his *Corona*, an epic poem; and in the following year *Die Fahrten Thiodolfs*; *Der Zau-*

berring; and *Singers Liebe*. After he had produced, in 1821, *Der Verfolgte*, and the romance of *Bertrand du Guesclin*, and in 1828, *Der Sängerkrieg auf der Wartburg*, he relapsed into comparative inactivity, during which he seems to have passed from an admiration of the mythology and chivalry of olden times to an extravagant esteem for their feudal government. His next work, *Die Weltreiche*, a poem published in 1835, showed that his former fascinating vivacity was considerably subdued, and that his thoughts, now growing grave and stern, were also becoming narrowed to the sentiments and feelings of a class. The quaintness of his style remained to give a charming brilliancy to the current of his thoughts, but failed to reconcile the public to his political opinions. His *Zeitung für den Deutschen Adel* (Paper for the German nobility), printed in 1841, tended only to diminish his popularity. Fouqué died at Berlin, in January 23, 1843, before the publication of his last work, *Abfall und Busse, oder der Seelenspiegel* (Apostasy and Repentance, or the Soul's Mirror).

Lamotte-Fouqué must ever be regarded as the most successful writer of the romantic school, which numbers amongst its disciples Tieck, Novalis, Hoffmann, Brentano, and Arnim. His mysterious knights, gnomes, and fairies, with their world of enchanted forests and talking trees, are described with a wonderful facility of poetic artifice; but at the same time he always wraps a deep and true moral in the disguise of supernatural imagery. His romances have also this distinguishing characteristic, that they are more purely romances than the works of most writers of the same school, and the gay visions which he depicts float at a safer distance above the realities of common life. Although it has recently become the fashion in Germany very much to underrate Fouqué's merits, later writers, such as Vilmar (*Geschichte der deutschen National-Literatur* 1856), regard him with higher favour. They hold him to be at least entitled to the merit of a skilful renaissance from the heroic poems of the twelfth century. His poetical works, however, are not so successful, as the themes are generally placed in a region much too high for his genius.

Besides the works above-mentioned, Fouqué published *Vaterländische Schauspiele*, 1811; *Altsächsische Bilder-saal*, 1818; *Lebensbeschreibung des Generals Henri Aug. Baron de la Motte Fouqué*, 1824; *Geschichte der Jungfrau von Orleans*, 1826; *General von Rüchel*, 1828; *Erzählungen und Novellen*, 1833; *Von der Liebeslehre*, 1837; *Goethe und Einer seiner Bewunderer*, 1840; *Selbstbiographie*, 1840; *Ausgewählte Werke*, 1841; *Der Pappenheimer Cürassier*, 1842.

L A M P.

A LAMP is a contrivance for producing light by the combustion of such materials as are fluid at common temperatures, such as most of the fixed oils; the solid fats being made into candles. The kind of oil used for burning in lamps varies, in different parts of the world, with the sources of supply. Whale oil is used in Great Britain, but seal oil, fish oil, and oils obtained from seeds by pressure are also largely consumed. In Paris the oils of rape-seed, and of poppy-seed are used; and in the S. of France, and in Italy, an inferior kind of olive oil, and also the oil of the earth-nut are employed. In the latter country a lamp oil is expressed from grape-stones. In Piedmont walnut oil is common; oil of sesamum-seed is burnt on the eastern and southern coasts of the Mediterranean; while in tropical countries cocoa-nut oil, which is solid in the climate of Great Britain, is generally used. In China, the *Camellia oleifera* is cultivated for the sake of the oil obtained from its seeds, also a shrub, *Croton sebiferum*, the fruit of which

yields a useful oil. In consequence of the deficient supply of tallow during the late war with Russia, inquiries have been set on foot in various parts of the world as to the seeds and other vegetable products from which oil may be obtained, and the result of these inquiries has already shown that many oil-yielding substances, not before known in commerce, exist. The export of oils from the East Indies, especially, *gingelly*, has greatly increased. Pistachio-nut oil is becoming common, as is also ground-nut oil from Africa. All these oils are used for burning in lamps.

Before a combustible can be made available for the purposes of artificial illumination, it must be decomposed in so regulated a manner that its hydrogen may furnish a steady flame, and its carbon the requisite amount of illumination; for which purpose the oil or fatty substance; whether in lamps or candles, must first be made fluid and then gaseous, the gaseous portion, resulting from the decomposition, by heat, of the fluid, filling the interior of the flame, combining

Lamp. with the oxygen of the surrounding air, and becoming dissipated as products of combustion, after having diffused both light and heat around. In a candle the combustible matter is rendered fluid by the heat of the flame, which forms the tallow just below it into a very perfect cup, which it keeps filled with liquid fat, and this is raised by the capillary attraction of the wick into the flame, where the chemical changes take place which result in the production of light and heat. In a lamp a similar action goes on, only the fluid combustible matter is contained in a separate reservoir, the position of which must be such as to cast as little shadow as possible. The simplest form of lamp consists of a thin layer of oil upon a quantity of water contained in a glass vessel, in which is floated a small brass cup, containing a glass tube, fitted by means of cork. The oil rises up the tube above the level on the outside, but when flame is applied to the top of the tube, the oil takes fire and burns with a small feeble flame: the fluid within the tube is depressed by the heat, and the pressure of the oil on the outside tends to overcome the depression, thereby maintaining the oil at the required height. If the tube exceed a capillary bore, the oil will not burn. In some cases, a waxed wick about an inch long is passed through the centre of a compound disk of cork and card, and this, with the cork undermost, is placed upon the oil floating on water in the glass vessel. This lamp, which gives a faint light, is called a *vielleuse*, and is sometimes used in France in bedrooms. Not more complex than this simple contrivance is the arrangement of the antique lamp (figs. 1, 2), which, with

Fig. 1.

Fig. 2.

great artistic beauty of form, does not claim a higher construction than the lamp of many rude nations.¹ It consists of a vessel, open or closed, with a wick rising through a hole in the beak; and as combustion can only take place on the outside of the flame, more carbon is likely to be liberated from the oil than the oxygen in contact with the flame can consume, hence such a lamp is always liable to smoke. In the old kitchen lamp the beak is removed a considerable distance from the reservoir, so as to diminish the shadow cast by the flame, and thus increase its illuminating power. Until the year 1789 (when Ami Argand invented the lamp which continues to bear his name) lamps were dull, smoky, ill-constructed articles, soiling everything around them, and filling the air with a nauseous odour.

The Argand lamp has undergone many improvements since the date of its invention. A common form of this lamp is represented in fig. 3, where A is the reservoir, which is air-tight at top, and has the neck immersed in oil, so that oil flows out of it only when the external air is admitted to ascend through the neck; it contains a short column of liquid, from the top of which the pressure of the atmosphere is excluded, and therefore the column is

sustained by the weight of the atmosphere pressing on its base, on the same principle as a bird-cage fountain. Oil is introduced into the reservoir A by taking it off and holding it with the neck uppermost. The sliding tube

Lamp.

Fig. 3.

Q is pushed so as to cover the hole *t*, and the oil is poured in by a hole at the bottom, which at other times is closed by a screw-nut; when this is done, the reservoir A is replaced in F, and secured by screwing it round. When the lamp is to be lighted, the hole *t* is opened by depressing the sliding tube by its handle Z, and the oil will flow out of A till it rise in F, and in the annular cavity that contains the wick, to the level of the top of the hole *t*. When the oil in F is lowered by the burning of the lamp, so that the surface of the oil in F is below the upper part of the hole, then a bubble of air ascends into A, and a similar quantity of oil descends into F, till the surface of the oil rises again to cover the upper part of the hole. It sometimes happens that the air in A is heated by the warmth of the room, and then too great a quantity of oil descends into F, in consequence of the expansion of the hot air in the upper part of A, so that the oil not being all consumed in the wick, falls down through the tube *g*, and may even run over from the cup P. This is an inconvenience attending the use of oil reservoirs of this construction. When the lamp is not burning, the hole *t* is closed by drawing up the sliding tube Q; the lamp may then be inclined, without making the oil descend from the reservoir. The cylindrical part, where the flame is produced, is composed of three tubes *d*, *f*, *g*. The tube *g* is soldered to the bottom of the tube *d*, just above *o*, and the interval between the outer surface of the tube *g* and the inner surface of the tube *d*, is an annular cylindrical cavity closed at bottom, containing the cylindrical cotton wick immersed in oil. The wick is fixed to the wick tube *ki*, which is capable of being moved spirally; within the annular cavity is also the tube *f*, which is capable of being moved round, and serves to elevate and depress the wick. P is a cup that screws on the bottom of the tube *d*, and serves to receive the superfluous oil that drops down from the wick

¹ These figures are copied from the originals in the British Museum.

Lamp. along the inner surface of the tube *g*. The air enters through the holes *o, o*, and passes up through the tube *g* to maintain the combustion in the interior of the circular flame. The air which maintains the combustion on the exterior part of the wick enters through the holes *m*, with which *m* is perforated. When the air in the chimney is rarefied by the heat of the flame, the column of the atmosphere, of which the chimney is the base, becomes lighter than the surrounding columns; and the surrounding columns, pressing with their excess of weight, enter the lower part of the chimney, and pass upward, with a rapid current, to restore the equilibrium between the adjacent columns of the atmosphere.

In some lamps, above the orifice of the tube *g*, and nearly at the height of the top of the flame, there is placed a circular plate of metal, of the same diameter as the tube: this has the effect of turning the current of air into that part of the flame where smoke would otherwise be produced. The same effect is obtained by the contraction of the cylindrical glass chimney at R G. See GAS-LIGHT. The oil flows from the reservoir A and F through N, and occupies the cavity between the exterior surface of the tube *g*, and the inner surface of the tube *d*. The oil rises in the annular cylindrical cavity between these two tubes to the level of the opening *t*. The part *hi* is a short tube, which receives the circular wick, and slides freely on the tube *g*. The tube *g* has a hollow spiral groove on its exterior surface, into which enters a pin connected with the wick-tube *hi*. The wick-tube has also a catch, which works in a perpendicular slit in the tube *f*; and, by turning the tube *f*, the wick-tube will be raised or lowered, for which purpose a ring, or stage, *m*, fits on the tube *d*, and receives the glass chimney R G; a wire S is attached to the tube *f*, and is bent over the edge of the tube *d*, and descends along the outside thereof. The part *m*, that supports the glass chimney, is connected, by four other wires, with the ring *q*, which surrounds the tube *d*, and is capable of being moved round. When *m* is turned round, it carries round along with it the ring *q*, the wire S, and the tube *f*, and thereby produces the elevation and depression of the wick.

In the most simple construction of Argand lamps, the surface of oil in the oil-reservoir is nearly on a level with the flame, because the capillary attraction of the wick can only raise the oil a little above the surface of the reservoir. The surface of the reservoir also is considerable, that the lamp may burn for a sufficient length of time before it has consumed so much oil as to reduce the level of the oil below the reach of the action of the capillary attraction of the wick. Mechanists have contrived lamps of various forms, with the view of removing the inconvenience of the shadow of the reservoir, which cannot be got rid of in the common lamp with one lateral beak.

In what is called the *Astral* lamp, the oil vessel is of a flat annular shape, so that a tolerably large supply of oil may occupy only a small depth. The vessel surrounds the burner at the distance of a few inches, and is supported by two curved tubes, one of which conveys the oil to the wick. The shadow of this oil vessel, though small, is cast all around, and the two supporting tubes also cast their shadows on the table, but when the lamp is hung from the ceiling, the shadow of the oil-vessel may fall so as not to be inconvenient. In the *Sinumbra* lamp (*sine umbra*, or without shadow), the shadow is greatly reduced by making the circular oil-vessel in such a way that its three surfaces meet in the form of a flat wedge, the sharp edge being directed towards the flame. The position of the flame, with respect to the oil-vessel, is such that two tangents drawn from the apex and base of the flame *oo* (fig. 4), meet a few inches behind it in a point, beyond which there is no shadow; and even within the space of the shadow the ground-glass shade which rests upon the oil-vessel, breaks

up the shadow by its diffusion of the light: *f* represents the inner cylinder, with the spiral groove for raising the wick. Lamp.

Fig. 4.

In order to get rid of the shadow, lamps have been constructed in which the oil-vessel is placed in the foot or pedestal, and the oil is raised to the wick by various ingenious contrivances. In *Girard's* lamp the oil is raised by

the compression of air somewhat after the manner of water in a fire-engine, or as in Hero's fountain, where the pressure exerted in one vessel is transferred to another distant vessel by means of the compressed air. In *Keir's Hydrostatic* lamp, the oil is raised and supported by a column of salt and water, sufficiently dense to support a column of oil $\frac{4}{5}$ ds of its own height. Instead of the solution of salt, other heavy liquids, such as syrup, honey, mercury, or a solution of sulphate of zinc may be used. The zinc solution is 1.57 times denser than oil, hence a column 10 inches high, will support a column of oil 15.7 inches high. The zinc column is fed from a reservoir, so as to maintain the oil at the proper level. Such lamps are subject to the great inconvenience of not being portable; indeed a very slight motion causes the fluids to oscillate and extinguish the flame. The principle of such lamps will be better understood by the following description of Mr Barton's lamp, in which T (fig. 5) is the oil-reservoir, from which the oil passes upwards to the wicks *a, a, a*. The oil-reservoir is open at bottom, at *h*. This is preferable to the mode of making the reservoir with a perforated bottom that screws off for the purpose of cleaning it. The fluid B, in which the oil-reservoir is immersed, is a solution of salt in water. This liquid is contained in a vessel RMO, which can be unscrewed at O, for the purpose of taking out the oil-vessel. N and Y are two floats fixed to the oil-reservoir and its tube. The column of the solution of salt, *ch*, presses against the oil at the open bottom of the reservoir, and maintains a column of oil in the tube to the height *e*; to this point *e* the wick descends, and raises the oil to the flame by the capillary attraction of its fibres. The specific gravities of the oil and the solution of salt

Fig. 5.

Lamp.

must be inversely as the heights ch and he ; that is, the specific gravity of the solution of salt must be made to bear to the specific gravity of the oil the same proportion that the perpendicular height eh , bears to the perpendicular height ch . As the oil is consumed, the salt water enters the hole at the bottom of the oil-vessel; the surface of the water at c sinks, and the oil-reservoir, with the tube and wicks attached to it, sink also. The upper part of the vessel R should be of a capacity a little less than the capacity of the oil-reservoir, so that, when the water has displaced the oil, and filled the oil-reservoir, the float Y may be at the bottom of the enlarged part of the water-vessel R . To prepare the lamp, the exterior vessel is filled with the solution of salt by the opening at l ; the solution passes into the oil-vessel by the open bottom h , and the oil-vessel rests on the bottom of the exterior vessel. The oil is then poured in through the tube e . The oil passes into the oil-reservoir, expels the water, and floats the oil-reservoir, raising the surface of the water in R .

Attempts have been made to get rid of the leading objection to hydrostatic lamps by placing a pumping apparatus in the oil reservoir in the pedestal, but as the pump has to be worked occasionally by hand, this is an objection. In *Carcel's Clock-work or Mechanical Lamp*, the oil is raised by clock-work in such quantity as to exceed that consumed during the time of burning, the excess constantly flowing back into the reservoir over the outside of the burner, thereby keeping the metal work cool, and thus preventing the formation of carbon on the outside of the burner: the wick must be raised higher than in ordinary lamps. Modifications of this lamp have been introduced, in which the clockwork is replaced by a descending weight, such as a piston in a cylinder, or by causing a spring to act upon a piston. In such examples it has been found difficult to regulate the supply of oil to the wick. In *Meyer's Elliptic Lamp*, a leathern piston or valve is worked by a rack and pinion, the oil being contained in a cylindrical vessel in the foot. So long as the piston is above the bottom of the oil-vessel, it is pressed by a spiral spring, attached to the top of the lamp; between the coils of this spring, and passing air-tight through the piston, is a tube, terminating in a funnel-shaped mouth in the oil-vessel, and covered with a perforated dish for straining the oil. The oil is pressed up this tube to the burner, near which is a fine silver tube, surrounded by a cup of wire gauze, of tinned copper, for straining the oil from solid particles. This tube, which is only $\frac{3}{8}$ th inch in internal diameter, regulates the flow of the oil, and its length and bore are so proportioned to the force of the spring, as to bring up enough oil to feed the flame, together with a surplus quantity which overflows, and keeps the metal parts of the wick cool. The lamp is supplied with oil at a point above the spiral spring, and flowing down, it occupies a position above the piston. By winding up the rack-work with a key, the piston is lifted to the top of the oil-vessel; the ascension tube, with the burner attached, is next pushed down through the piston, whereby the oil occupies a position below the piston, which is forced down by the spring, and thus raises the oil. Such a lamp will yield a good light for eight or ten hours, and will allow of the combustion of crude vegetable oils.

In *Parker's Economic or Hot-oil Lamp*, the oil-vessel is situated above the flame, for the double purpose of throwing the shadow in an unobjectionable direction, and also for overcoming the consistency of crude whale oil, which requires to be made fluid by heat before it can be burned in common lamps. Fig 6 illustrates the construction of this lamp. R is the oil-vessel, consisting of a double cylinder of metal, surrounding the upper part of the chimney M , from which the oil descends by the arm A , to the burner. This arm has at its lower part a slide-valve D , worked by a trigger TC , on raising which the supply of oil can be cut off, and

the oil-vessel removed for filling. The valve allows the oil to be introduced, care being taken to fill the reservoir completely, since any air left in it would expand by heat, and cause the oil to overflow. The glass chimney G rests on three points, which can be raised or lowered by a rack and pinion, by which means the flame is regulated, not by the motion of the wick, as in ordinary lamps.

The facility with which volatile oils are decomposed and give off their carbon, renders them in general unfit for burning in lamps, but where such oils are plentiful, they may be brought into use by being mixed with other substances, which diminish the percentage of carbon. Thus, in some parts of Germany, oil of turpentine is mixed with strong spirit of wine; such a mixture is burnt in a lamp of peculiar construction, consisting of a large oval reservoir, into which the burner fits tightly, and descends nearly to the bottom. The burner consists of a wide metal tube passing down another tube, which surrounds a loose cotton wick. At the top of the burner tube is a narrower tube, terminating in a knob, and just below the knob is a ring of small holes. A small cup surrounds the burner-tube, in which a small quantity of spirit of wine is burnt preparatory to using the lamp, and the heat thus excited causes a portion of the spirit mixture to issue from the ring of holes, in the form of an inflammable vapour, which being ignited, a crown of flames is formed, surrounding the metal knob, the heat of which continues the vaporization, and the lamp burns in this way without requiring further attention. The light thus produced is brilliant, but expensive. Lamps have been prepared in Great Britain for burning various preparations of hydro-carbon, alcohol, pyroxylic spirit, &c. Lamps without wicks have been formed for the combustion of naphtha, resembling in principle the German lamp above described. Camphine has also been much in request. This substance is prepared by distilling oil of turpentine over chloride of calcium, so as to get rid of water; it then contains 88.46 per cent. of carbon, the remainder being hydrogen, so that it is a powerful illuminating body. From the readiness, however, with which it is decomposed, considerable care is required in adjusting the supply of air; if there be not sufficient oxygen, large flakes of unconsumed soot escape into the room, and unless the camphine be carefully prepared, it is apt to give off an odour which produces headache. Under proper management, the camphine lamp yields a white and brilliant light.

During the late war, the managing directors of Price's Patent Candle Company contrived a kind of lamp stove, which they call the *Crimean Army Stove or Camp Lantern*, and which was adapted for baking, for boiling, and for warming a tent. Its dimensions are 17 inches in height, 19 inches across the handles, and 15 inches from back to front, the weight being about 30 lb. It consists of a square sheet-iron box, with a door and latch, a cover for the same, a baking pan, with a cover, two lamps, each with six wicks, trimmed with cocoa-nut oil, and there is also a loose grating. The directions are as follows:—*For baking*: Let the baking pan, with cover, rest upon the top ledges, put the cover on the stove, then place the two lamps upon the bottom grating, light the 12 wicks, and shut the door; in less than half an hour the stove will be at a proper baking heat. *N.B.*—By covering the top of the stove with a coat, blanket, or sack, you will get up the

Lamp.

Fig. 6.

Lamp
Black
||
Lampe-
dusa.

heat sooner, and bake more rapidly; be careful that the baking pan has on its own cover, as well as that belonging to the stove. *For boiling*: Remove the baking pan, and let the loose grating to carry the sauce-pan rest upon the middle shelf; on the bottom grating place one or both of the lamps, according to the rapidity with which you want to boil. *For warming a tent*: Remove the baking pan,

and upon the bottom grating place one of the lamps, then put the cover on the stove.

Lamps for special purposes are described in other parts of this work, such as the *Miner's Safety Lamp*, under COAL; the *Lighthouse Lamp*, under LIGHTHOUSE; the *Furnace Lamp*, as used by the scientific chemist; the *Spirit Lamp*; the *Locatelli Lamp*, and some others. (C. T.)

LAMP-BLACK, a variety of carbon or charcoal in a state of minute division, prepared chiefly from the impure resin and other refuse left after the distillation of turpentine. These secondary products are burnt in iron pots, or in a furnace, with a supply of air inadequate to their complete combustion, and the dense smoke thus produced is passed into chambers lined with sheep skin, or with sacking, upon which the soot or lamp-black forms a deposit. It is swept off from time to time, and sold without any further preparation. In this state, however, it contains salts of ammonia, and certain resinous and bituminous matters, all of which may be driven off by heating the crude lamp-black to redness in a close vessel. Thus purified, the lamp-black is almost entirely pure carbon, and when heated in the air it will burn away with scarcely any residue. Lamp-black was formerly prepared by burning lamps fed with crude refuse oils, in a close chamber, and collecting the soot from the smoky flames in the manner above mentioned, whence the origin of the name lamp-black. The theory of its formation is simple: if a compound of hydrogen and carbon be raised to a temperature sufficient to convert it into an inflammable vapour, and enough oxygen be introduced to combine with the hydrogen only, water will be formed, and the carbon be deposited.

The chief demand for lamp-black is in the manufacture of black paint and printer's ink, for which it is often prepared by burning coal-tar. A coarse lamp-black, used in paying ships, &c., is also prepared from some kinds of coal. (C. T.)

LAMPADEPHORIA, *i.e.*, the *torch-bearing*, or the *torch-race*, an Athenian ceremony at the festivals of the fire-gods Prometheus, Vulcan, and Minerva, in which the runners carried lighted torches, sheltered by shields, from the joint altar of these gods in the outer Ceramicus to the Acropolis. After the battle of Marathon, it was introduced into the festivals of Pan; and in the time of Socrates, into those of Artemis, on which occasion horses were first used. The art seems to have consisted in carrying a lighted torch from the starting-place to the goal without letting it go out. Several chains of runners were stationed along the race-course, which was about half a mile in length. The first runner in each chain passed the lamp to the second, he in his turn to the third, and so on. That chain which was the first to pass the still burning torch to its destination was declared victorious. The ceremony was most probably intended to symbolize the theft of the fire from the chariot of the sun by Prometheus, and to commemorate the benefits which have accrued to mankind from his crime.

LAMPEDUSA (the ancient *Pelagia* or *Lopadusa*), an island in the Mediterranean, belonging to the kingdom of the Two Sicilies, and lying midway between Malta and the Tunis coast, in N. Lat. 35. 29. 12., E. Long. 12. 35. 12. It is 7 miles in length from E. to W., by scarcely 1 in breadth. The interior is level, and abounds in dwarf olives and other similar shrubs, which are cut down and exported to Malta and Tripoli for firewood. But the shore is high and precipitous, except on the S.E. side, where it is low, and indented by a number of small bays. Wild goats are found in great flocks; and caves are numerous both on the sea-shore and in the interior. This island was made a state prison by the king of Naples in 1843. As dependencies, it has the islands Lampione and Linosa.

LAMPETER, a market-town and parliamentary borough of Wales, in Cardiganshire, near the Teify, 29 miles E. by N. from Cardigan. The college of St David's, a handsome quadrangular building, founded in 1822 by Bishop Burgess, is intended for theological students who could not bear the expense of attending Oxford or Cambridge. It accommodates about seventy students, and has an annual income of L.3000. Pop. (1851) 907.

LAMPRIIDIUS, *ÆLIUS*, one of the writers of the *Augustan History*, who lived at the beginning of the fourth century, during the reigns of Diocletian and Constantius, to whom he dedicates his work. The *Augustan History* is composed by six different authors, and contains a series of biographical sketches of the Roman emperors, from Hadrian to Carus and his sons (117–285, A.D.) These authors were *Ælius* Spartianus, *Vulcatius* Gallicanus, *Trebellius* Pollio, *Flavius* Vopiscus, *Ælius* Lampridius, and *Julius* Capitolinus. Lampridius wrote the four lives of Commodus, Diadumenus, Heliogabalus, and Alexander Severus. He seems to have been more attentive to the accuracy of his facts than to the beauty of his style. It is supposed by Vossius (*De Hist. Lat.* ii. 7), and by Fabricius (*Biblioth. Lat.* iii. 6), that Lampridius and Spartianus are the same writer; but this opinion has been ably refuted by Demoulines. (See Moller, *Diss. de Æl. Lampridio*, Altorf, 1688; Casaubon, *ad Spart. Adrian.*)

LAMPSACUS, or LAMPSACUM, a celebrated Greek colony of Asia Minor, on the shore of the Hellespont, not far from the spot where the strait begins to widen out into the Propontis. It was colonized by settlers from the Ionian cities of Phocæa and Miletus, but it had already been long in existence under the name of Pityusa. It had an excellent harbour, and soon became a great commercial mart. During the Ionian revolt, it passed into the hands of the Persians, but even during the period of their supremacy it continued to be governed by a native tyrannus. In 479, after the battle of Mycale, it allied itself with Athens, and continued faithful till near the close of that century, when, on the occasion of the Athenian disasters in Sicily, it revolted. The Athenians, however, reduced it again with ease. Like most of the other Greek cities in Asia, it submitted to Alexander the Great. At a later period it opened its gates to the Romans, when they reached it on their way to the conquest of Syria. Under the Romans it long continued to thrive. Lampsacus was the chief seat of the worship of Priapus, who is said to have been born there of Aphrodite. It gave birth to several distinguished men, among whom may be mentioned Anaximenes the orator, Metrodorus the Epicurean philosopher, and Charon the historian. A small village called Lamsaki stands near the site of the ancient town, of which not a trace is now to be seen.

LANARK, a royal and parliamentary burgh of Scotland, capital of Lanarkshire, is situated on an eminence near the N. bank of the Clyde, 25 miles S.E. from Glasgow. The town, declining and deserted at the beginning of this century, has been revived since the introduction of hand-loom weaving among the inhabitants, the majority of whom are employed by the Glasgow cotton manufacturers. Lanark joins with Airdrie, Linlithgow, Hamilton, and Falkirk, in returning a member to Parliament. From a very early

Lanark,
New
||
Lanark-
shire.

date it was a place of importance. Here Kenneth held a council in 978; Wallace killed Heselrig in 1297; and the Covenanters issued their proclamation in 1682. The remains of two Roman camps are distinctly traced in the neighbourhood. Pop. 5008.

LANARK, *New*, a manufacturing village, is situated on the N. bank of the Clyde, about a mile from the town of Lanark. It was founded by David Dale in 1783, and was afterwards improved by his son-in-law, Robert Owen the socialist, who tried to introduce his scheme of communist life into the manufactory. The inhabitants are exclusively engaged in cotton-spinning. Pop. about 1600.

LANARKSHIRE, or CLYDESDALE, is one of the largest, most populous, and most important of the counties of Scotland. It is situated between N. Lat. 55. 18. and 55. 56., and W. Long. 3. 24. and 4. 23. It is bounded N. by the counties of Dumbarton and Stirling, S. by Dumfriesshire, E. by the counties of Edinburgh, Linlithgow, and Peebles, and W. by those of Ayr and Renfrew. Its extreme length from S.E. to N.W. is about 54 miles, its greatest breadth from E. to W. being 33. It contains an area of about 986 square miles, or about 631,719 imperial acres. In early times Lanarkshire formed a portion of the Roman province of Valentia, and afterwards of the British kingdom of Strathclyde. A part of the neighbouring county of Renfrew was formerly included in this district, but during the reign of Robert III. it was disjoined, and formed into a separate jurisdiction in favour of his eldest son James. At that time Lanark was divided into two wards, the *over* and *nether*; the burgh of Lanark being the chief town and seat of justice of the former, and the burgh of Rutherglen of the latter. These divisions continued till the last century, when they were formed into three wards, and this division exists even to the present day. The *upper*, of which Lanark is the chief town, and which contains about two-thirds of the whole area of the county, is, on the E., S., and S.W., chiefly mountainous; the *middle*, which has the town of Hamilton in the centre, stretches along the W., and N.; and the *lower* contains the city of Glasgow, and a small tract around it.

This extensive district presents great variety of surface. In its upper, or southern portion, it is hilly and mountainous, the principal mountains being the lofty Lowthers, which, on an average, rise to 2450 feet above the level of the sea, the highest peak being 3100 feet. The heights of the other mountains are—Culterfell, 2454; Tintock, 2317; and Cairntable, 1944. Leadhills, a village on the southern extremity of the county, is, at its S.W. end, 1323 feet above the level of the sea, being the highest inhabited ground in Scotland. In proceeding along the banks of the Clyde, N. from Tintock, the face of the country softens down to gentle elevations and depressions, and for 12 miles the river winds slowly through fertile *haughs*. The middle ward is much less elevated, few of the heights being much more than 700 feet above sea-level, the town of Hamilton being only about 80; yet there are no plains of any extent, except along the banks of the Clyde, and a considerable part of the surface is covered with moss, in many places to a great depth. Of the lower ward, the greater portion is a well inhabited district, particularly the banks of the Clyde, which are thickly planted with villas and villages, dependent on, or connected with, the city of Glasgow.

The principal river, being the third in size, but, in a commercial point of view, the greatest in Scotland, is the Clyde, from which the county is frequently called Clydesdale. It has its rise among the wastes of the mountains which separate Lanarkshire from Dumfriesshire, about 1400 feet above the level of the sea, and near to the sources of the Tweed and Annan. Issuing from its almost imperceptible source, about the head of the Dear Water, it flows

onward in a N.W. direction, and after receiving several streamlets, assumes the name of the Clyde. Passing through a lonely and pastoral country, and thereafter skirting the ruined castle and little village of Crawford, it gradually increases in size until it reaches Bonniton, the first of the famous Falls of the Clyde. Here the banks slope gently downwards, and are ornamented with lofty trees and leafy brushwood. Before reaching the fall the channel has become broad, and the course of the river uninterrupted and tranquil, but here the stream tumbles over a height of 27 feet, and descends into a glen in a broad and unbroken sheet. From this point the banks become precipitous, and are beautified with wood. The bed of the river becomes rugged, and its waters roll turbulently along, until they reach the magnificent fall of Corra, where they at once dash over a precipice of 85 feet in height, falling into the deep abyss of the *linn*. The scenery in the neighbourhood of this cataract is of the boldest and most romantic description. Hurrying on through a deep ravine, the river reaches a third but smaller fall, called Dundaff Linn, and passing a singular piece of rock called Wallace's Chair, where it is said the Scottish patriot once found a temporary concealment, and skirting New Lanark, with its extensive cotton-mills, and passing the county town of Lanark, it at length receives the waters of the Mouse, which, dashing and foaming from the split rocks of Cartland Crag, adds to the volume of the stream, and contributes, at the precipice of Stonebyres, to form the fourth, and perhaps the most striking fall of the Clyde. Near to the junction of the Nethan with the Clyde are the ruins of Draffin or Craignethan Castle, generally considered as the Tillietudlem of Sir Walter Scott. In this castle the beautiful and unfortunate Mary Queen of Scots, found a temporary asylum, after her escape from Lochleven Castle. The Clyde, having again received the Avon, and having passed the ruins of Cadzow, sweeps through the richly-wooded *haughs* of Hamilton, extending to upwards of 1410 acres, in the centre of which stands the ducal palace of that name, one of the most magnificent and classical edifices in Scotland. Lower down, the Clyde is spanned by the Bridge of Bothwell, celebrated for the deadly conflict which took place in 1679 between the king's troops and the Covenanters, and passes the ruins of Blantyre priory, founded in the thirteenth century, and of Bothwell Castle. At Glasgow its commercial importance commences. There the Clyde becomes navigable for vessels of more than 1000 tons burden, and drawing fully 19 feet water. See GLASGOW.

The soil of Lanarkshire is of great variety, but the moorish and mountainous predominate. The upper ward consists, to a great extent, of moorland and pasture. In the lower valleys of this ward, however, wheat is sometimes grown, but the cereals best adapted for this lofty district are oats and barley. Potatoes are widely cultivated, while of late years turnip husbandry has been much increased. In the middle ward the land under tillage is chiefly from 250 to 300 feet above the level of the sea. It is generally clay, but along the banks of the Clyde and its tributaries there are considerable tracts of an alluvial description. It is in this ward where the orchards of Lanarkshire are placed, which seem to have been a characteristic of this portion of Scotland since the days of the venerable Bede. During the French war, when excluded from the continental supply, the yearly average derived from their fruit was little short of L.8000; but since the increased facilities for continental communication, many of the Lanarkshire orchards have been now as much devoted to the rearing of gooseberry and currant bushes for the Glasgow market as to the cultivation of apples, pears, or plums, which are subjected to foreign competition. The lower ward, particularly along the banks of the Clyde, is a fertile and highly cultivated district. From the vicinity of Glasgow, the farmers are

Lanark-
shire.

Lanark-
shire.

here stimulated to the highest efforts of agricultural improvement. Of late years much land has been reclaimed, and draining has been everywhere prosecuted with great vigour, while the plantation of trees in exposed situations has also contributed to ameliorate the climate. As the greatest portion of the county slopes towards the W., the breezes of the Atlantic exert a powerful influence on the climate. For about two-thirds of the year the wind blows from the S.W. and W. Frosts are never of long duration, and long-lying snow is rare. In general the atmosphere is humid, and the harvest, at least in the uplands, is generally late. The range of the thermometer is from 11° to 85° . The mean maximum and minimum at Glasgow for 1851 to 1854 was 47.1 , while the mean quantity of rain that fell each year was 37.22 inches.

From the peculiarity of the soil, and the humidity of the climate, great attention is paid to the rearing of stock, and to the produce of the dairy. The fact is, milk cows and dairy produce are two of the chief objects of attention in the upper ward, and particularly in the parishes of Carnwath and Lesmahagow, where the best cheeses are made, being equal to the first quality of Dunlop. The Ayrshire breed of cattle has hitherto been most prized, but the Lanarkshire newly improved breed, crossed by the Ayrshire cow and short-horned bull, or *vice versa*, has been found superior. The draught horses of this county are justly celebrated. They are generally bred in the upper ward, and are supposed to have originated from some Flanders or Holstein horses brought over in the seventeenth century by one of the dukes of Hamilton.

The following are the agricultural statistics of the county in 1856, omitting fractions:—

Number of occupants	2,978		
Total acreage under a rotation crop	209,541		
Wheat	8,973	Acres.	
Barley	1,787		Acres.
Oats	54,803		
Rye	56		
Bere	299		
Beans	4,010		
Pease	317		
Vetches or Tares	1,688		
Turnips	11,443		
Potatoes	8,733		
Mangold	114		
Horses for agricultural purposes above 3 years old	5,765		
Do. do. under 3 years	1,506		
All other horses	1,399		
			8,670
Milk cows	31,309		
Other cattle	20,740		
Calves	9,373		
			61,422
Sheep of all ages, for breeding	89,859		
Do. do. for feeding	20,313		
Lambs	66,817		
			176,989
Swine			6,998
Total stock	254,079		

Irrespective of the city of Glasgow and the burgh of Lanark, there are the burghs of Hamilton, Airdrie, and Rutherglen, with which may be classed the populous villages of Strathaven, Biggar, Blantyre, Bothwell, Wishaw, Coatbridge, Carnwath, Carluke, Douglas, Lesmahagow, Leadhills, New Lanark, Cambuslang, and Stonehouse. The cotton manufactures, the iron-works, and mining give employment to the generality of their inhabitants.

The lakes or lochs within the bounds of Lanarkshire are few and small. Of these are the Bishop's Loch between the parishes of Cadder and Old Monkland, the Black Loch in New Monkland, Johnston Loch in Cadder, Long Loch near Lanark, Cran Loch in the parish of Dunsyre, and

Hogganfield and Frankfield Lochs in the Barony parish of Glasgow. The most extensive sheet of water in the county is the Hill Reservoir, for supplying the Forth and Clyde and Monkland Canals, and which covers an extent of 307 acres.

The geological structure of Lanarkshire is very varied. The central and western districts are occupied by an extensive and rich coalfield, a part of the great carboniferous band traversing Scotland from sea to sea, in a direction from S.W. to N.E. The middle portion of this formation in the Monklands and adjoining parishes is of fresh water origin, and without limestone, but contains the best coal seams, with blackband and other ironstones. Towards the borders on all sides a lower marine series, with encrinal and coralline limestones, crops out. It also contains many valuable coal seams and ironstone, and a few interpolated beds of estuary or fresh water origin. The line of junction between this lower series and the old red sandstone passes across the upper ward, in the vicinity of the Falls of the Clyde, Lanark, and Carstairs. The old red also bounds the fields on the N. and W. in the counties of Dumbarton and Renfrew. The boundaries on the E. and W. are chiefly formed of nearly continuous ranges of trap hills, separating the Lanark fields on the one hand from those of Linlithgow, and on the other hand from those of Ayr. Trap rocks also rise through, and disturb the strata of the interior in many places, and numerous whin dykes intersect the area, affecting generally a N. and S. direction. These, like the other erupted masses, usually alter the strata passed through, converting coal into coke, clay into jasper, and highly indurating the shales and sandstones. In the highest and most southern portion of the county, viz., at Leadhills, there are veins of lead from a few inches to fifteen, and from this silver, to the extent of six to twelve oz. in the ton, has been extracted. Gold also is found among the mountains, imbedded in quartz, or washed down into the sides of rivulets. Gold was first discovered here in the reign of James III., from which a number of coins, known by the name of unicorns, was coined. In the reign of James V. 300 persons were employed searching for this metal, and it is said that gold to the extent of L.100,000 was collected. In 1854, the lead obtained at Leadhills amounted to 216 tons, from which 170 tons of pure lead was obtained. In the valuable paper by Mr Hunt, "On the Mining Industries of the United Kingdom," he states that L.20,000 were expended at Leadhills to obtain less than L.5000 of gold.

It is on the mineral wealth of the county that its prosperity chiefly depends. In 1854 there were 153 collieries, employing 15,580 persons, and 13 ironworks, having 72 furnaces in blast, and 16 out of blast, and employing 3649 iron-miners, and about 1000 men in the management and working of the furnaces. In the manufacture of malleable iron, it may be stated that, up to 1842, the production did not exceed 35,000 tons, whereas in 1854 it reached 122,400, the number of men employed in this branch being about 4000. The amount of yearly wages paid to the persons employed in the iron and coal works throughout Lanarkshire amounted, in 1854, to about L.1,352,400.

While these departments of industry give so much employment to the population of Lanarkshire, the various cotton, flax, silk, and woollen factories within its bounds tend still more to give work and wages to the people. In 1850 there were 85 cotton-spinning factories, having 864,088 spindles, and 18,811 power looms, employing 5013 males and 17,450 females; 8 woollen factories, having 8765 spindles, and employing 115 males and 372 females; one worsted factory, having 96 spindles, and employing 225 males and 78 females; four flax factories, having 21,044 spindles, and employing 321 males and 808 females; and four silk factories, having 24,402 spindles, and employing 85 males and 418 females. The

Lanark-
shire.

Lanark-
shire.

grand total being 102 factories, 918,395 spindles, 18,811 power looms, and 24,885 persons employed. These last figures show that those working in factories are 4·7 per cent. of the population of Lanarkshire in 1851. Since 1850 there has been a considerable increase of cotton manufactories within the county, some very extensive new factories having been lately erected, although a few also have unfortunately been consumed by fire. The progress of cotton-spinning may be exemplified from the fact that there were only 44 cotton mills in 1831, having 640,188 spindles.

Lanarkshire is well supplied with roads, canals, and railways. The great road from Glasgow to Carlisle and London intersects the whole county, and in every direction it is traversed by roads in the best state of repair. In addition to the great and increasing navigation of the Clyde, the Forth and Clyde Canal connects it with both friths. The

Monkland Canal brings down the mineral riches of that Lancashire district to Glasgow, and the Ardrossan Canal connects Glasgow with Paisley and Johnston. Nowhere in Scotland are more railways to be found. The Caledonian links it with England and the north; the South-Western with Ayrshire and Dumfries; the Hamilton with Glasgow and that burgh; the Dumbartonshire with the Vale of Leven, Helensburgh, and the Highlands; and the Wishaw and Coltness with the coal and iron fields of Wilsontown and Shotts.

In population, no county in Scotland has increased so rapidly as Lanarkshire. In 1801 it amounted to 146,699; in 1811, to 191,752; in 1821, to 244,387; in 1831, to 316,819; in 1851, to 532,114. The following table gives a *vidimus* of the population at the last and previous census in the three different wards of the county.

Years.	Upper Ward.		Middle Ward.		Lower Ward.				Total.
	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.	
1851	19,570	20,702	61,411	57,620	176,713	196,098	257,694	274,420	532,114
1841	17,756	19,078	50,451	46,321	143,290	157,203	211,497	222,602	434,099
Increase.....	1814	1624	10,960	11,299	33,423	38,895	46,197	51,818	98,015

From the above table it will be observed that the total increase upon the whole county, including the city of Glasgow, from 1841 to 1851, was no less than 98,015, the increase being particularly observable in the manufacturing and mining districts, the rate of increase over the whole county being nearly 2·25 per cent. on the entire population of the county, and the rate on the city of Glasgow being 23·62 per cent. In the upper ward, the excess of females in 1851 was 1132; in the middle ward, the excess of males over females was 3791; and in the lower ward, the excess of females over males was 19,835; while the excess of females, which chiefly obtains in Glasgow, was, over the whole county, 16,726. From the great increase of mining operations in the middle ward, and of shipbuilding, engineering, and iron-works around Glasgow, attracting thither hosts of workmen, since the last census was taken, the present population (1856) cannot be less than 600,000. As the last Government census only gives the number of houses, and not, as formerly, of distinct dwelling-houses, it is impossible to state the precise number of inhabited houses, as these are understood in Scotland, that is to say, the houses, whether in flats or otherwise occupied, each by a distinct family. As the number of separate occupiers or families was found in 1851 to be 103,106, this figure may be taken as a near approximation to the number of distinct occupied houses within the whole county. In 1841, these amounted to only 81,576.

The county of Lanark returns one M.P., the constituency being in 1856 only 3126. Were the Registration of Voters Act in burghs extended to counties, the constituency would probably be trebled. The city of Glasgow sends two members, with a constituency of (in 1856) 18,168; and the royal burghs of Lanark and Rutherglen, and the towns of Hamilton and Airdrie, have a share in the election of two other members; Lanark, Hamilton, and Airdrie being joined with Linlithgow and Falkirk; while Rutherglen is linked with Kilmarnock, Rensfrew, Dumbarton, and Port-Glasgow. Lanarkshire contains 55 parishes, of which 11 belong to the Presbytery of Lanark, 14 to that of Hamilton, and 21 to that of Glasgow, all in the Synod of Glasgow and Ayr, and 9 to the Presbytery of Biggar, in the Synod of Lothian and Tweeddale. Of clergymen, there are 95 belonging to the Establishment, 60 to the Free Church, 59 to the United Presbyterians, with a fair proportion of Episcopalians, Baptists, Independents,

Roman Catholics, &c. For its judicial management the county has one principal sheriff and six substitutes, the principal and three substitutes being resident in Glasgow, the other three being resident in Lanark, Hamilton, and Airdrie. There are four prisons within the county, viz., at Glasgow, Hamilton, Lanark, and Airdrie. The following is the daily average number of criminal prisoners confined in each of these during the last four years:—

Year.	Lanark.	Hamilton.	Airdrie.	Glasgow.	Total.
1852-53	22	37	19	580	658
1853-54	13	34	30	574	651
1854-55	13	34	34	547	628
1855-56	23	34	33	461	551
	71	139	116	2162	2488

It will be observed from the above table that, in spite of an ever increasing population, there has been for four years past an annual diminution of criminal prisoners within the jails of Lanarkshire.

The valued rent of Lanarkshire in 1674 was L.162,131 Scots, the valued rent in 1855-56, was as follows:—

City of Glasgow, including Railways and Canals,	£1,336,475
County landward portion, do. do.	917,970
Hamilton, Burgh of do. do.	19,682
Airdrie do. do. do.	23,848
Rutherglen do. do. do.	11,581
Lanark do. do. do.	8,043
	£2,317,599
	(J. S.—G.)

LANCASHIRE, a county of England, embracing the larger part of the largest coal-field in Europe, and containing upon its surface the larger share of the most numerous manufacturing population in the world.

It is alike distinguished in a commercial and in a historical sense. As a palatinate it gave sovereigns to the throne, and as the seat of manufactures it is the recipient of a moiety of the commerce of the kingdom. For purposes of trade it is admirably situated, being for nearly 70 miles washed on the W. by the Irish Sea, and having at the extreme S. the port of the Mersey, which gives admittance to the largest vessels. The figure of the county is extremely irregular. Including the large indentations of the estuaries of the Mersey

Lancashire. and the Ribble, and the Bay of Morecambe, in the county, the western part presents a tolerably straight line, and the outline of the whole county is estimated at 342 miles, the area being 1765 square miles, or 1,129,600 acres, hardly more than 900,000 of which are available for purposes of agriculture.

Rivers. The county is well watered, although the only port of magnitude is that on the Mersey. Those of Preston, Fleetwood, and Lancaster are neither large nor much frequented. The principal rivers are, the Mersey, the Ribble, the Irwell, the Douglas, the Wyer, the Ken, the Leven, the Duddon, and the Lune. The smaller streams are numerous, but more remarkable for rendering the scenery picturesque than for any commercial or manufacturing purpose. The Mersey rises in the hills of Yorkshire, passes by the town of Stockport, enters the Irish Sea at Liverpool, and separates Cheshire from Lancashire. It is navigable up to Warrington, but is merely so far an inlet of the sea. At Flixton it receives the Irwell, which originates in the moors of Yorkshire, and passes by Bolton and Manchester. The Ribble intersects the whole county, and is received into a large arm of the sea a little below Preston. It is navigable to very near that town. The Douglas has its source in the hills around the Rivington Pike, passes by Wigan, and, after receiving some smaller brooks, empties itself into the estuary of the Ribble. The largest river in the N. of the county is the Lune, which, flowing from the hills of Westmorland, enters Kirby Lonsdale, is augmented by the Greta and the Wenning, and after pursuing a south-westerly course, becomes navigable 2 miles below Lancaster. The Wyer rises in the moors between Lancashire and Yorkshire, and flows into the Wyer Water near Poulton.

Mountains. The only piece of water approaching the dimensions of a lake is at Conistone, situated near Furness, parallel to Windermere Lake, a large portion of which is also in Lancashire. The principal hills in this county are the "Fells." The highest is Conistone Fell, in Furness, a part of which is called "Grey Friar," or "Old Man," and is stated to be 2577 feet above the level of the sea. Pendle Hill, above Clitheroe, is 1803 feet; Bleasdale Forest, 1709 feet; and Rivington Pike, 1545 feet high. The other hills are Caton Moor, Woolfell Crag, Padiham Heights, Longridge Fell, Go Hill, Bollinga Hill, Whittle Hills, Cubbear Hill, Hamilton Hill, Cartmell Fells, Wharton Crag, Gargrath Fell, and Blackstone Edge, which separates Yorkshire from Lancashire. The greater portion of these hills are comparatively barren.

Mosses. As the greater portion of Southern Lancashire lies low, the progress of cultivation was in several places interrupted by mosses, bearing a close resemblance to the bogs of Ireland. Many of these have been drained, and the process is still going on. The largest mosses were Chat, Pilling, Trafford, Risley, Ashton, Road, Bickerstaff, Rainford, Marton, St Michael's, Catforth, and Hough. Many of these have almost ceased to exist, and even Chat Moss, the largest, is now being rapidly encroached upon by agricultural enterprise. Some of these mosses, from time to time, have exhibited the phenomenon known in Ireland by the term "moving bog." In 1633, Hough Moss moved from its ancient site, and did considerable damage. In the same century, Chat Moss presented a similar eruption. In 1744 Pilling Moss rose to a surprising height, passed to the adjoining ground, covering nearly 100 acres of land, just as in 1771, Solway Moss, in Scotland, floated away upon the lower lands. Pilling Moss has since been reclaimed.

Forests. Anciently there were several forests, principally at Myerscough, Fullwood, Bleasdale, Wyersdale, and Quernmoor, situate in the northern part of the county, and these belonged to the duchy of Lancaster. The forests have now all disappeared, but the land appertains to the crown, and contributes to the income of the duchy.

The soil is very unequal, and the progress of agriculture, until very recently, was remarkably slow. An agricultural society has existed for about two-thirds of a century, but it is only now that landowners are encouraging their tenants to drain and adopt a scientific system of a rotation of crops. In general the farms are small, and the overflow of opulent people on the environs of towns renders husbandry more fanciful than profitable. The demands for villa property drive back the farmers, and leave only a moderate quantity available for market-gardening. The climate, too, is humid in consequence of the proximity of the sea and the obstructive high lands which rise in the N. of the county. The rain fall is heavy; in mountain districts, according to Mr Miller, the fall of rain increases in quantity from the valley upwards; but the greatest rain fall is found at an elevation of 1000 feet. In the district of Rivington Pike, Mr Hawksly has found, at elevations varying from 430 feet to 1800 feet, the fall of rain to be 56½ inches, and the quantity flowing off the ground 44 inches, leaving 12½ inches for evaporation and absorption. On the lower ground the fall varies from 30 to 40 inches.

Archæology has recently dug evidence out of tumuli a tolerable British civilization prior to the arrival of the Romans. According to such dubious proofs as the records afford, the S. of Lancashire was inhabited by a people who bore the name of *Setantii* or *Segantii*, interpreted to mean "dwellers in the country of water," and their capital, it is alleged, stood on the Ribble. The northern part of the county, in common with Yorkshire and Cumberland, was peopled by the Brigantes, and their name occurs most frequently in the Roman annals, because with them most of their wars were waged. Recent writers contend that the Gauls and the Saxons were for centuries confined to the E. of England, and that the people of the N. were derived from Scandinavia. The dialect, not yet extinct, of certain parts of the county, would seem to give some slight support to this opinion: thus a scythe is called a *liar*, the pure Icelandic word for that instrument.

The Romans established stations at Manchester (*Man-cunium*), Warrington (*Veratinum*), Ribchester (*Rerigonium*), Colne (*Culunium*), Blackrode (*Coccium*), Lancaster (*Ad Alaanam*), and Overborough (*Bremetoniacum*). These they connected by a network of roads, some five feet wide, and others much wider. They diverged from Blackroad, and embraced all the southern stations then running directly to Chester and York. Four of these roads still remain—two from N. to S., and two from E. to W. During their dominion in Britain, Lancashire and Yorkshire were called *Maxima Cæsariensis*, or *Britannia Superior*. Under the domination of the heptarchy Lancashire formed part of the kingdom of Northumberland. This arrangement existed from 547 to 926. After the introduction of Christianity, the churches became numerous in Lancashire, as in the other Saxon provinces; and near to each church was erected a castle. Twelve of these castles,—Walley, Walton, Childwall and Winwick, Blackstone, Tephon, Standish and Penwortham, Wigan, Rochdale, Middleton and Bury, were erected at the S. of the Ribble. In the N., as the religious houses were larger, we may infer more local opulence.

The political divisions of the county resembled those of the Teutonic people everywhere, and probably were like those which prevailed previous to the arrival of the Romans, for that people seldom interfered with the local arrangements of the countries they conquered. Lancashire was divided into six hundreds; the four northern, Lonsdale, Amounderness, Blackburn, and Leyland, constitute the northern division; while the south division consisted of Salford and West Derby.

Previous to the Norman conquest this county was distinguished as an "honour," on which lordships and manors depended. The lands of such honours were granted by

Lancashire. the kings in fee to noblemen, who were bound to keep honour courts; inferior to these courts were manor courts and wapentakes.

The Norman conquest produced a great change. In the Domesday Book, or Census Book, of William the Conqueror, the name of Lancashire does not appear; and the lands between the Mersey and the Ribble were then of so little value, that they are set down at L.120.

The barons of the honour of Lancashire were changed, and Roger de Poitou placed his barons in Liverpool, Widness, Warrington, Newton, Stockport, and in different passages from Rochdale, along the hills of Clitheroe, at Hornby, on the River Wyer, Furness, Penworthan, on the Ribble, and at the various points throughout the county, holding himself the Castle of Lancaster. The land between the Ribble and the Mersey subsequently came into possession of William Earl of Ferrars, who took the title of Earl of Derby, and was made chief lord of the whole county. His successors held the office until 1265, when the then Earl of Derby forfeited his title and his lands, by having taken part with Simon de Montford. Henry III. gave these possessions, with the honour of Lancaster, to his youngest son, Edmund Crouchback, who was created the first Earl of Lancaster. In 1253 this earl was invested with the dominion of Sicily and Apulia, and had the title of King of Sicily. From this incident date some of the most remarkable events in English history. Edmund was enriched by grants and possessions, and in that way was laid the foundation of the greatness which identified, for so many years, the house of Lancaster with the throne. The earls of Lancaster henceforth lived in royal state. Edward III. created Henry Plantagenet the first Duke of Lancaster, and the daughter of the first duke married John of Gaunt, the fourth son of Edward III., who, on the death of his father, was created Duke of Lancaster. His son, Henry IV., decreed by act of parliament, that the revenues and titles should remain to him and his heirs for ever a distinct and separate inheritance of the crown. John of Gaunt, by his great influence and great deeds, succeeded in advancing the county to the dignity of a palatinate. In addition to Chester and Lancaster, Pembroke and Durham were palatinates, but the jurisdiction was taken away by Henry VIII. from Pembroke, and in the reign of George IV. from Cheshire. The Duke of Lancaster had *jura regalia* within the county, subject only to the king's general superiority. He had a court of chancery and a court of common pleas; appointed judges, magistrates, and law officers; pardoned treasons, murders, and felonies; and all writs and judicial proceedings were issued in his name, the king's writs being of no force within the county. Henry VIII., however, greatly diminished these privileges. He took away the power of appointing judges and magistrates, and denied to the duke the privilege of pardoning felons, ordering that all writs should run in the king's name, but to be witnessed in the name of the duke. When the crown obtained possession of the palatinate, a duchy court was established, in which all questions of revenue and counsel affecting the duchy's possessions were to be heard and decided. The court was originally held in the duchy office in Westminster, but it is now permanently fixed at Lancaster-place, Waterloo Bridge, London. The court, as a court of equity for cases arising within the county, sat at Preston, but its operations were, for a long time, merely nominal. This arose from the fact of the six cursitors in the court at Preston retaining all the costs and fees. Attorneys, therefore, declined to frequent the court, preferring the higher court, where the law was considered to be much better administered. Within the last few years, however, the powers of the court have been considerably enlarged, and a registrar, holding offices in Liverpool and Manchester, enables local solicitors to transact much of their business

within the county. The principal court is still at Preston, Lancashire. but the vice-chancellor attends at every assize in Liverpool to transact the business of his office, which of late has considerably increased. At Lancaster a receiver attends annually to transact the pecuniary business of the duchy. The chancellorship of the duchy is a ministerial office, without ostensible duties attached.

The forest laws existed in the Saxon time, and the chief men of the forests were endowed with extraordinary powers. They continued to be exercised until a comparatively recent period. They fell, however, into disuse, and were ultimately abolished by the wars of the houses of York and Lancaster, but the records of its proceedings are extremely meagre. In 1588 the chancellor's fee was L.288, 16s. 4d., and the sum paid to all the officers in salaries was L.641, 3s. 4d. Some years ago the revenue of the duchy was estimated at L.14,000; the disbursements, L.11,741; remaining in custody of the receiver, L.2258. In 1830 Sir Henry Parnell obtained a select committee to inquire into the civil list. The object was to separate the proper expenses of the crown from other charges mixed up with them; but the result was unproductive of anything more than a nominal alteration. William IV. retained the revenues of the duchies of Lancaster and Cornwall. That of Lancaster is permanently annexed to the crown, but that of Cornwall belongs to the crown only when there is no Prince of Wales. Until recently, no return was ever laid before parliament. The gross income of the duchy of Lancaster enjoyed by the crown in 1843 was L.33,037; but the sum paid to the keeper of Her Majesty's privy purse was only L.13,000; the difference is exhausted in the payment of officers, and in charges paid by the woods and forests. The duchy has considerable possessions out of Lancashire. From the creation of Lancashire into a palatinate the history of the county merges into that of the kingdom; for the wars of the Roses, and the Rebellion of 1745, are of general, rather than of local interest.

From a very early period Lancashire was remarkable Manufacture for the production of cloth. Manchester, in the sixteenth century, was a market for woollen fabrics; around it were settled numerous weavers, and these were supplied with yarn from the midland counties, from Scotland, but particularly from Ireland. In 1650 they were distinguished for their manufacturing industry, and in 1720 Manchester had a reputation for enterprise and wealth. The great impediment, however, was the scarcity of cotton yarn. In 1769, however, Arkwright made known his first discovery; discoveries and improvements followed, and Lancashire may now be said to monopolize the most of the cotton manufacture of the kingdom. Silk manufactures were not introduced before 1819, but is now an extensive trade.

Since 1851 the population has greatly increased, and so has the cotton trade. In the article COTTON all the facts will be found; but the following return of the export of cotton manufactures for the first six months of 1854, 1855, and 1856, will show that the increase continues:—

1854.	Quantity.	Value.
Cotton manufactures.....	862,242,082 yards ...	£12,395,170
Ditto yarns.....	70,908,290 lb. ...	£3,255,036
1855.	Quantity.	Value.
Cotton manufactures.....	964,868,662 yards ...	£12,840,203
Ditto yarns.....	77,653,787 lb. ...	£3,295,770
1856.	Quantity.	Value.
Cotton manufactures.....	1,002,400,985 yards ...	£14,032,602
Ditto yarns.....	84,467,782 lb. ...	£3,643,575

Mr James Heywood in 1838 published a map of the Coal-field. Lancashire coal-field. It commences within 5 miles of Liverpool at Tarbock, and runs to Colne, 45 miles; its greatest width is 30 miles, and the bed forms a figure like the beak of an eagle, the bill towards Liverpool. In the S. it is surrounded by red sandstone, and in the N. by grit-

Lancashire. stone. It keeps at a distance of about 5 miles from the River Mersey, and touches it only at Stockport. The coal-field extends into Cheshire and N. Wales, and is separated only by a brief interval from the coal-field of Yorkshire. Mr Dickinson, inspector of coal mines, enumerates the number of collieries in Lancashire, Cheshire, and North Wales as follows :—

334	are in Lancashire,
28	... Cheshire,
5	... Anglesea,
30	... Flintshire, and
26	... Denbighshire.

Total.....423

“The number,” he says, “of working pits or shafts, exclusive of those used solely for air, is 879, besides 60 additional winnings by levels and inclined planes called ‘day-eyes,’ making a total of 939 separate winnings, whereby coal is now being worked. The pits are of various depths up to 520 yards. Shafts of greater depth are proposed; but at present 520 yards is the greatest depth of any working pit. Deeper coals have been worked by inclined planes from the bottom of shafts, and workings are now going on in this way at about 600 yards below the surface. 679 of the pits are in Lancashire; 50 in Cheshire; and 150 in North Wales. Their average depth is 115 yards; those of Lancashire being 118 yards; Cheshire 123 yards; and North Wales 97 yards. The united depth of the working pits being upwards of 57 miles.

“The number of persons employed in and about the collieries in 1852 amounted to 38,800; of whom 31,950 were employed underground, and 6850 on the surface; viz. :—

	Above ground.	Below ground.	Total employed.
In Lancashire.....	5370	25,530	30,900
... Cheshire.....	560	2,140	2,700
... North Wales.....	920	4,280	5,200
Total.....	6850	31,950	38,800

	Tons.
Quantity raised in Lancashire in 1852.....	8,255,000
... Cheshire	715,000
... North Wales	953,000
Total produce of the district	9,923,000

The consumption of Manchester is estimated at two million tons a year, but it is understood that the cost of carriage forbids coal being brought into that city from a greater distance than 12 miles.

The export of coal from Great Britain in 1855 was 4,568,235 tons, and of this quantity only 331,623 tons were from Lancashire.

Minerals.

A not very old author, West, describes the iron mines at Whitrigs, near Ulverstone, as the greatest in the kingdom, but, with the cessation of wood-fuel, iron ceased to be worked in the county. “In Lancashire,” says Mr Binney, F.G.S., in the *Memoirs of the Literary and Philosophical Society of Manchester*, “many beds of cannel run into blackband, in a similar manner to what often takes place in Scotland. However, it is in the upper coal-field that the most valuable ores occur. Above the four-feet mine at Patricroft, and extending under Chat Moss, is a bed of the carbonate of protoxide of iron, about 2 feet 6 inches in thickness. This was found in sinking the shafts of Messrs Lancaster and Co.’s at Patricroft, not far from the Liverpool and Manchester Railway. On analysis, the ore yielded about 72 per cent. of carbonate of iron, and the gentleman, a medical man, who analysed it, told me that it was pure enough to be used for medicinal purposes. Above the three-quarters mine at Bradford, and over the main limestone at Ardwick, are beds of blackband of 12 and 6 inches, respectively, in thickness, the representatives, beyond all doubt, of the red stone

of the pottery coal-field, as their geological position, and Lancashire. the fossils they contain, are exactly the same. Some of the above beds of ironstone only want thoroughly investigating to make them worthy of attention.

“In the middle coal-field are many argillaceous and blackband ores fully as rich as those wrought in other places, and so situated that they could be calcined together with great advantage. Amongst the former are those of Clifton and St Helens, and doubtless many other places in the same position; and amongst the latter the black stone above the cannel mine at Wigan, and several impure cannels and blackbands in that neighbourhood and about Dixon Fold. Below the four-feet coal at Rendleton a carbonaceous blackband was found in sinking Mr Fitzgerald’s pit, about four feet in thickness.

“The vast deposits of hæmatite found in the N. of Lancashire, in the hundred of Furness, occur in great clefts of the carboniferous limestone. These, no doubt, from their great purity, being but little mixed with foreign matters, had their origin from volcanic sources, on or near the spot where they are now found. Some of them, probably, may have come up through the bottom of the clefts in which they occur; and others, from a short distance, have flowed with water into their present positions.”

The population of the county was, in

1801.....	671,486	1841.....	1,667,054
1821.....	1,052,948	1851.....	2,031,236

Popula-
tion.

In fifty years the increase is 201 per cent. Of the 2,031,236 persons, 1,852,103 reside in towns, thus reducing the rural population to 179,133 persons. Of the entire population, 290,948 were engaged in the manufacture of cotton, 85,732 were domestic servants, 38,798 were occupied in farm labour, and 29,793 were employed in the manufacture of silk.

The population about Manchester is most dense, for within ten miles of the city are the great manufacturing towns of Bolton, Bury, Rochdale, Oldham, Ashton, and Stockport, with a multitude of minor places, all more or less engaged in manufactures.

In 1800 the common roads were much complained of; but nearly fifty years before the people of Liverpool projected the Sankey canal, for the purpose of bringing coal from near St Helens to Liverpool. It was not quite 10 miles long. The Duke of Bridgewater soon after projected his first canal; it was subsequently united to the Staffordshire Canal, or Grand Trunk Navigation, and joined Liverpool to Bristol and Hull. The Leeds and Liverpool Canal was commenced in 1770, and ultimately, by a circuitous route of 130 miles, joins Liverpool and Leeds. In addition to these canals there are the Lancaster Canal, the Manchester Canal, the Manchester and Oldham Canal, the Rochdale Canal, and the Ulverstone Canal.

By railways nearly all canals have been converted into merely auxiliary means of transit. The first railroad on which locomotives were used was opened in 1830, between Liverpool and Manchester. Lancashire is now traversed by a multitude of iron roads; one from S. to N. bisects the county, three cross it, at intervals from each other, and these are connected with each other by twelve union lines.

In a manufacturing and trading population like that of Lancashire pauperism is always considerable, sometimes state-large. Employment is not always constant, and “strikes,” or “turn-outs,” frequently interfere with the resources of the working classes. Comparatively, however, the poor rates press less heavily in this than in the majority of other counties. The cost per head on population in 1801 was 4s. 4d. in Lancashire; in the other counties it ranged from 4s. 8d. to 16s. In 1821 it was 4s. 8d. in Lancashire, and in other counties it was as high as 17s. 6d. In 1841 it was 3s. 6d. in Lancashire, as high as 10s. in Bucks, and the lowest was

Lancaster. 3s. 9d. in Monmouthshire. The cost per head in the principal poor-law unions in England and Wales was 4s. 3½d. in 1854, and 4s. 11½d. in 1855.

Religion and education. Religious zeal exhibited itself ardently after the introduction of Christianity, and wherever there was a castle in Lancashire there was a church. The religious houses, however, were not very numerous, but we find three very distinguished ones: one in Furness, one in Cockersand, and one in Wahaley. Originally the N. of Lancashire appertained to the see of York, but before the Norman invasion it had been annexed to the province of Canterbury and the diocese of Lichfield, and continued so until the sixteenth century. An alteration then took place, and a large portion of South Lancashire was included in the diocese of Chester. In 1835, however, ecclesiastical commissioners were appointed to consider the state of the Established Church, with reference to ecclesiastical duties and revenues. These commissioners recommended the formation of two new sees in the province of York; *videlicet*, one at Manchester, and the other at Ripon. Subsequently they recommended that the deanery of Furness and Cartmel should be added to the diocese of Carlisle, but that the deaneries of Amounderness, Blackburn, Leyland, Manchester, and Warrington, then forming part of the diocese of Chester, should be included in the diocese of Manchester. In 1836, with some slight alteration, this proposition received the sanction of the law. The income of the Bishop of Manchester is not to be less than L.4000, nor more than L.5000 per year.

The Reformation seems to have encountered more opposition in Lancashire than in any other county. The principal Catholic families adhered to their own church, and of course sustained the Catholic population dependent upon them. In the reigns of Elizabeth and Mary, penal laws were intended to apply particularly to this county, and the sufferings they entailed are told with great minuteness by the Catholic historians. In the reign of Charles I., the Lancashire Catholics were ardent loyalists, and they were not less attached to the cause of his sons. The gunpowder plot, however, brought down upon them the vengeance of the law, and their sufferings at that time were most severe. Persecution, however, seldom makes converts, and the largest Catholic population in England is still found in Lancashire, augmented constantly by immigration from Ireland.

The creeds of the people of Lancashire seem to have been affected by other circumstances, for it has been found that dissent is most extensive where manufactures prevail. Thus, at the census in 1851, there belonged to the Established Church in Lancashire 529 places of worship, containing 389,546 sittings; of all other denominations, 1098 places of worship, containing 423,789 sittings. The number present in the Established Church on the Sunday on which the census were taken was 222,810; of Protestant dissenters, 227,634; Roman Catholics, 104,302. The total attendance was 554,746, a little more than one-fourth of the population.

The Scottish Presbyterians had 22 places of worship; Independents, 170; Baptists, 100; Wesleyan Methodists, 521; Calvinistic Methodists, 19. This will indicate, to some extent, the comparative proportion of dissenters.

In 1851 there were 3014 day schools in Lancashire, having 215,847 scholars. The number of Sunday schools was 1524, and the number of scholars, 323,173. (v. J. W.)

LANCASTER, a municipal and parliamentary borough and seaport-town of England, capital of Lancashire, on the left bank of the Lune, about 7 miles from its mouth in Lancaster Bay. The town stands on the slope of a hill, on the summit of which is a fine old castle originally built in the eleventh century, but rebuilt in the reign of Edward III., by John of Gaunt, and now used as the county gaol. The

county courts attached to this building are chiefly of a modern date, and are very commodious. On the north side of the castle stands St Mary's Church, an edifice in the later English style, containing carved stalls, screen, and monuments. Though the town is finely situated, the streets are generally narrow, ill-paved, and inconvenient. The houses are generally well built, the material being obtained from the freestone quarries in the vicinity. Among the public buildings are a town-hall, lunatic asylum, theatre, assembly-rooms, public baths, custom-house, several alms-houses, and a free grammar school. The Lune is here crossed by a handsome stone bridge of five arches. The river is navigable for vessels of 300 tons up to the town. About half a mile N.E. of the town the Lancaster Canal is conducted over the Lune by means of a noble aqueduct erected by Rennie at a cost of L.48,000. The Lancaster and Preston Junction Railway, forming a portion of the great north-western line stretching from London to Carlisle, Glasgow, and Edinburgh, passes through the town. Manufactures of cotton, silk, linen, and sailcloth; cabinet-making and upholstery and ship-building; marble-polishing works and iron foundries are carried on. On 31st December 1855, 88 sailing vessels of 8996 tons, and 9 steamers of 1148 tons, were registered as belonging to the port. During that year 1719 vessels of 127,443 tons entered, and 780 vessels of 78,475 tons left the port in the coasting trade; while 13 vessels of 3709 tons entered, and 8 vessels of 2751 tons left in the colonial and foreign trade. Lancaster is governed by a mayor, 6 aldermen, and 18 councillors; and returns two members to parliament. Pop. of parliamentary borough (1851), 16,168; municipal borough, 14,604.

LANCASTER, a town of the United States of North America, capital of Lancaster county, Pennsylvania, is situated near the right bank of Conestoga Creek, an affluent of the Susquehanna, 70 miles W. of Philadelphia by railway. It is one of the oldest towns of the state, and was capital of Pennsylvania from 1799 to 1812, when the government was transferred to Harrisburg, the present capital. Its streets are regularly laid out, and the houses are substantial and commodious edifices, mostly of brick. The chief public buildings are—the county prison, the new court-house, an elegant edifice in the Grecian style, and Fulton Hall, for public meetings and assemblies. Franklin College, which was founded here in 1787, but afterwards declined, has been recently united with Marshall College of Mercersburg, and a building called Franklin and Marshall College has been erected.

The cotton manufacture is carried on with much success here, as well as that of rifles, carriages, and threshing machines. The population is, for the most part, of German origin. Lancaster is well supplied with churches and schools, and public libraries. It has 16 churches, 5 being Lutheran and German Reformed, 2 Roman Catholic, 2 Presbyterian, 2 Methodist, and the rest belonging to smaller sects. Lancaster was founded in 1730, and incorporated as a city in 1818. Pop. (1840) 8417; (1850) 12,369; (1854) about 14,000.

LANCASTER, a town of the United States of North America, capital of Fairfield county, Ohio, is situated on both sides of the Hocking River, an affluent of the Ohio, 30 miles S.E. of Columbus. It stands in a beautiful and fertile valley, through which the Hocking and Ohio Canal passes. The town is well built, and contains several churches, while it is connected by railway and canal with the principal towns of the district. In the neighbourhood is a natural pyramid of sandstone. Lancaster was founded in 1800. Pop. (1850) 3480; (1854) about 5000.

LANCASTER, Sir JAMES, an English seaman of the Elizabethan era, noted as the commander of the first expedition sent out by the East India Company in 1600–1603; besides accomplishing all that he was sent out to do, he opened

Lancaster
||
Lancaster,
Sir James.

Lancaster,
Joseph
||
Landen.

commercial negotiations between his employers and some of the petty princes of Java and Sumatra. During his voyage he learned enough about the north-west passage to feel assured of its practicability. When he reached home he urged the matter so strongly that expeditions were sent out under Weymouth, Hudson, and other experienced navigators. The secret was not destined to be unriddled for two centuries and a half later; but Baffin, one of those who advanced farthest N., gave the name of Lancaster Sound to a strait which has now been found to communicate with the Arctic Ocean. Had the explorers pushed their way through this sound they would have solved the mystery of the north-west passage. Lancaster's services were acknowledged with the title of knighthood. He died in 1620. The history of his discoveries is given in vol. iii. of Hakluyt's *Voyages*, and vol. i. of Purchas' *Pilgrims*.

LANCASTER, *Joseph*, an educational reformer of much note, was the son of a retired private in the Foot Guards, and was born at London in 1778. When a mere lad he opened a school, on the principle of mutual instruction, for poor children, in the wretched purlieus of Southwark. Before he was twenty-three he had more than 300 pupils, who, according to his system, were taught for almost nothing. His pamphlet on the *Amelioration of Education* had an immense success, and brought him under the notice of the Duke of Bedford, and finally of George III., whose encouragement gave a great impulse to the establishment of Lancasterian schools throughout the country. Extending his views, Lancaster set out in 1807 on a tour through the chief towns of England and Scotland. He was a devoted member of the Society of Friends; and the Anglican clergy, finding that he admitted children of every sect into his schools, began to cry out that the church was in danger, and opposed him with all their might. Lancaster was imprudent; his imprudence resulted in his ruin in Great Britain, and in 1818 he set off to try his fortunes in the new world. He was at first well received, but his zeal again outran his judgment, and in 1829 he emigrated to Canada. The Canadian parliament awarded him some small grants, with a view to giving his experiments fair play. Ill luck again attended him, and he was only saved from great distress by some kind friends, who purchased a small annuity for him. Retiring to New York, he died there in very reduced circumstances, October 24, 1838. Lancaster was the author of several small elementary text-books and pamphlets, in which he advocated his views of education. Whatever be the value of Lancaster's system of instruction, it must cheerfully be confessed that his labours gave a powerful stimulus to the education of the lower classes in England, where numerous schools on his plan still exist.

LANCASTER SOUND. See POLAR SEAS.

LANCIANO (the ancient *Aranum*), a town of Naples, province of Abruzzo-Citra, 6 miles from the Adriatic, and 13 miles S.E. from Chieti. Its commerce, though once extensive, is now comparatively small. The chief buildings are, the archbishop's palace, cathedral, and several of the parish churches and convents. It has an ecclesiastical seminary, and some other schools. Pop. 14,250.

LANDAU, a fortified town of Germany, in Rhenish Bavaria, is situated on the Queich, distant 18 miles N.W. from Carlsruhe. Its chief manufactures are, linens, woollens, tobacco, oil, and fire-arms. The houses are well built and commodious, and arranged in regular streets; while the buildings specially noticeable are, an arsenal, some military establishments, a Roman Catholic church, two Protestant churches, and Latin, agricultural, and industrial schools. From the fifteenth century it has been an object of contest in every great European war; and from 1680 to 1815 it was generally held by the French.

LANDEN, JOHN, a distinguished mathematician of the eighteenth century, the English D'Alembert, as he is called

by the French, was born at Peakirk in Northamptonshire in 1719, and died in 1790. The most of his time was spent in the pursuits of active life, but he early showed strong talent for mathematical study, which he eagerly cultivated at his leisure hours. In 1762 he was appointed agent to Earl Fitzwilliam, and held that office till within two years of his death. Beyond these facts nothing is known of his private history, which seems to have been more than usually uneventful. He lived a very retired life, and saw little or nothing of society. When he did mingle in it, his dogmatism and pugnacity caused him to be generally shunned. He first made himself known as a mathematician in 1744, by his essays in the *Ladies' Diary* for that year. Besides his separate works, he communicated to the Royal Society at different times valuable papers on the most difficult parts of mathematical and physical science, all of them distinguished by depth and powerful ingenuity. One of the most memorable of his achievements was a new form of the fluxionary calculus, which he published in 1758, under the title of *Residual Analysis*. The plan proposed, though inelegant and needlessly complex, may be deemed on the whole an improvement on the method of ultimate ratios. To confer more consequence on his innovation, he contrived likewise a set of symbols and applied his algorithm to the solution of different problems; but it never attained any currency, and soon fell into oblivion.

Landen's works, not included in the *Transactions* of the Royal Society, are, a volume of *Mathematical Lucubrations*, 1755; the *Residual Analysis*, 1764; two volumes of *Memoirs*; and some tracts on *Converging Series*.

LANDER, RICHARD, a distinguished African traveller, was born in Cornwall in 1804. He was brought up as a printer, but abandoned that trade to enter the service of Captain Clapperton, whom he accompanied on his second journey to Africa in 1822. This expedition was attended with important results. (See CLAPPERTON.) Returning to England in 1829, Lander submitted to government a plan for exploring the course of the Niger, which was accepted. He solved the great problem of the course of that river, by tracing it down from Yaouri, above Boussa, to its mouth in the Bight of Benin, and returned to England in 1831, after an absence of a year and a half. In the following year he again set out with his brother, with the view of tracing it up to Timbuctoo. The expedition proved a total failure. Richard Lander was killed in an encounter with the natives, and his brother perished from the effects of the climate. (See AFRICA.)

LANDERNEAU, a seaport-town of France, department of Finistère, in the valley of the Landerneau or Elorn, 13 miles N.E. from Brest. The chief articles of its commerce are, linen goods and thread, glazed hats, leather, military equipments, honey, Dutch cheese, wax, corn, and horses. Vessels of 400 tons burthen can enter its harbour, and about 700 are said to visit it yearly. Pop. 5113.

LANDES, *LES (The Heaths)*, a maritime department in the S.W. of France, part of the old province of Gascogne, is bounded on the N. by the department of Gironde, E. by Lot-et-Garonne and Gers, S. by Basses-Pyrénées, and W. by the Bay of Biscay. It extends from N. Lat. 43. 28. to 44. 38., and from E. Long. 0. 7. to 1. 33. W. The Adour, flowing westward, divides it into two unequal portions. The northern abounds in pine-woods, furze, and brushwood. Numerous lagoons lie along the coast, and shifting sands are everywhere in the interior. Of the entire area, consisting of 2,303,400 acres, a sixth is arable, a third under wood, and a half sterile. Buffaloes and wild horses are found in the *Landes*, and ill-favoured sheep are tended by shepherds, who stalk over the sand and prickly shrubs on stilts. The soil is a dull gray sand, and its only crops are a few scattered patches of maize and barley. The southern portion, called Chalosse, is traversed by offsets of the Pyrenees, watered by the af-

Lander
||
Landes.

Landgrave fluents of the Adour, and is of considerable fertility, producing corn, wine, and fruit in abundance. The climate of **Landes** is mild, but unhealthy, especially along the coast. Its natural products are, timber, coal, iron-ore, stone, and marble. Rosin, pitch, and tar, glass, porcelain, earthenware, paper, and leather are manufactured. Its principal rivers are the Leyre, Adour, and Gave-de-Pau. It is divided into three arrondissements, Dax, Mont de Marsan, and St Sever; into 28 cantons, and 333 communes. Pop. (1851) 302,196. Mont de Marsan is the chief town.

LANDGRAVE (*land*, earth; and *graff*, a count), a name given to those counts of Germany who claimed to take their rank from a large province or territory. The title was originally given to the four princes of Thuringia, Hesse, Alsace, and Leuchtenberg; but there are other landgraves, who are not princes, but counts of the empire.

LANDON, LÆTITIA ELIZABETH (*Mrs Maclean*), well known for the pleasing, and at one time highly popular poetry, which she wrote under her initials, L. E. L., was born in 1802, at Chelsea, near London. Till her fourteenth year her time was spent almost equally between town and country, but in 1815 she settled, with her father's family, at Brompton. A near neighbour in that suburb was Mr Jerdan, the editor of the *Literary Gazette*. Some small pieces which she submitted to him were inserted in that journal. These were followed by others of a higher strain, and in a short time it became the fashion to admire the verses of L. E. L. Just as she was emerging into popularity, her father died, in very straitened circumstances. The duty of supporting his family fell upon her, and literature, with which she had at first only coquetted, now became the business of her life. Besides occasional pieces in verse, she contributed largely and regularly in prose to the *Literary Gazette*, chiefly critical notices of novels, and books of poetry and travels. Her intimate connection with that journal and its editor seemed to countenance a false and cruel scandal, which gave the most exquisite pain to its victim. In 1821 Miss Landon published her first considerable work, under the title of *The Fate of Adelaide, a Swiss Romantic Tale, and other Poems*. She speedily followed it up with the *Improvisatrice*, the *Troubadour*, the *Golden Violet*, the *Venetian Bracelet*, and a good many other efforts equally long. At the same time, there was hardly a journal of any note in which she did not scatter some of the waifs and strays of her fancy. In 1831, and the six following years, she edited *Fisher's Scrap-Book*, an annual which, under her care, reached a rare standard of excellence as well as popularity. She also found time to write three novels, *Ethel Churchill*, *Francesca Carrara*, and *Romance and Reality*. In 1838 Miss Landon was married to Mr Maclean, governor of Cape Coast Castle. Except in so far as her health was delicate, her married life was a happy and peaceful one. She had long suffered severely from a complication of nervous diseases, and was in the habit of relieving her pain with small doses of prussic acid. One day, October 15, 1839, she was found dead in her room, holding in her hand a phial of her usual medicine. She had accidentally taken an overdose, and death had been instantaneous. The circumstances of the case gave rise to vague and cruel suspicions, now known to have been utterly groundless.

L. E. L.'s poetical works show her to have possessed a rich fancy, a fine vein of sentimental melancholy, and excellent power of expressing romantic emotion. She delighted to choose her subjects from the old romance, and to treat them romantically. This, in probably a greater degree than their poetical quality, was the secret of their success. Had she been in circumstances to concentrate her powers, she might have earned for herself a niche in the English temple of fame; but, like Mrs Hemans, she wasted her strength in a rapid succession of small efforts,

which served their time, and then were forgotten. Had Landsberg she lived she might perhaps have fulfilled the promise of high genius held out by her youthful effusions.

In 1841 Mr Laman Blanchard published the *Life and Literary Remains of L. E. L.* From this work it is evident that her life was in the main a painful one; yet it is also asserted that the melancholy of her verses is in complete contrast to the vivacity and playfulness of her manners in private life.

LANDSBERG, a town of Prussia, province of Brandenburg, and capital of a cognominal circle, situate on the Wartha, 37 miles N.E. from Frankfort. It has a small shipping trade; and its manufactures comprise chiefly woollen and linen cloths, hosiery, leather, and paper. It is fortified, and contains several handsome buildings. Pop. (1849) 12,630.

LANDSEER, JOHN, Associate Engraver of the Royal Academy, was born at Lincoln in 1769. His engravings for Bowyer's *History of England* and other works first brought him into notice, and he gained a considerable reputation from a course of lectures on engraving, delivered before the Royal Institution in 1806. These were afterwards published. After having accepted the appointment of Associate Engraver of the Academy in the hope of being elevated to the full privileges of membership, he found that his hopes were vain, and devoted himself more steadily to literary aims in connection with his profession. Two art periodicals, started under his management, ultimately proved failures, the second being swamped by the *Art-Union Journal*. His *Sabæan Researches* (1823) were published in continuation of lectures on engraved hieroglyphics, delivered at the Royal Institution. In 1834 he published his *Descriptive, Explanatory, and Critical Catalogue of the Earliest Pictures in the National Gallery*, a work full of amusing gossip, although not free from blunders, and certainly destitute of any claim to be regarded as an authority in matters of art criticism. He is perhaps best known as the engraver of *Dogs of Mount St Bernard*, painted by his son, Sir Edwin Landseer. He died in 1852, leaving two sons, Thomas and Charles, besides the painter already mentioned.

LAND'S END (the ancient *Bolerium*), a granite crag, the most westerly point in Cornwall, England; N. Lat. 50. 4., W. Long. 5. 44.; 266 miles S.W. from London. About a mile W. is the lighthouse of Longships, having a fixed light 88 feet above high water.

LANDSHUT, a town of Lower Bavaria, on the Isar, 39 miles N.E. from Munich. The staple of its commerce is corn, cattle, and wool. Besides numerous mills, distilleries, and breweries, it has manufactures of woollen cloth, leather, starch, tobacco, paper, hosiery, cards, copper-ware, and surgical instruments. Though now on the decline, Landshut was once of great importance. The Castle of Trausnitz, on a hill overlooking the town, was for three years the prison of Frederick of Austria, and during the thirteenth century the residence of the dukes of Bavaria. The removal of the University of Ingolstadt thither, in 1800, gave the town a fresh importance; but its withdrawal to Munich, in 1826, hastened its decline. Pop. 9800.

LANFRANC, Archbishop of Canterbury, and one of the most learned men of the eleventh century, was born at Pavia in 1005. His father was one of the chief magistrates of that city, then the capital of Lombardy. After going through the usual course of study at Bologna, Lanfranc returned to his native town, practised there for a time as an advocate, and opened a school of law. He taught with great success, but the field was too narrow for his ambitious views, and he accordingly removed to Avranches, in Normandy, where his class-rooms were soon filled to overflowing. An accident changed the plan of his life, and induced him to enter the church. Entering the Abbey of

Langeland. Bec as a monk, he rose in the course of three years to be prior. He next established a theological school, which, under his management, became one of the most famous of Western Europe. It was the centre of a new scientific life, which, instead of pursuing the beaten track of church tradition and practical theology, started on a course more dialectical and speculative. Still holding, however, the principle of Augustin, that the sole business of reason was to unfold and defend the data of church tradition, this new dialectical tendency could not fall into collision with the faith of the church. It did, however, come into conflict with a freer tendency of inquiry which had set in, and, under Gotteschalk and Berengar, was turning the tide of speculation to doctrinal controversies. His famous controversy with Berengar, the Archdeacon of Angers, on the subject of the Eucharist, belongs to this period of his life. The dispute originated in a letter which Berengar wrote to him on the subject, in somewhat free-spoken terms, expressing his doubts of the common orthodoxy, but claiming only to be a heretic with Augustin, Ambrose, and Jerome. Lanfranc was then absent at Rome, and the letter became public at the Pontifical Court. Accordingly, in a hasty dread of any stain of heresy, he allowed Berengar to be condemned unheard. Berengar was, however, afterwards cited to Rome, and in the fear of death, recanted. Lanfranc, in after-correspondence, sought to overbear him by a sense of shame, accusing him of perjury; but Berengar held his ground, and still continued to preach his own views. In the voluminous correspondence which passed between them, it seems abundantly evident that Berengar was borne down by passion and power, to which considerable scientific acumen and theological learning gave a keener point and force. Lanfranc's name was now well established, and he was admitted to the most secret counsels of William the Bastard of Normandy, who made him abbot of the new monastery of St Stephen, at Caen. When William became King of England, he gave him the see of Canterbury; and whenever affairs called him back to the continent Lanfranc carried on the government in his absence. After the Conqueror's death, his son William Rufus entrusted to his care the political as well as the ecclesiastical interests of the state, and he was practically King of England till his death, which took place in 1089, after he had completed his eighty-third year. His political career forms part of the history of England, and historians are unanimous in praising his wisdom, forethought, and integrity. In his diocese he did much good by establishing schools, rebuilding the cathedral, which had been destroyed by fire, and vindicating for his see the primacy of all England. The most important of his works are his *Letters*, his *Commentarius in Epistolas B. Pauli*, and his *Libellus de corpore et sanguine Domini, contra Berengarium*. These works display the learning with which their author has been always accredited, along with great force and terseness of reasoning, and great clearness and precision of thought. The style is simple and nervous, and interests the reader in the subject-matter. The best editions of Lanfranc are those of Luc, D'Achery, in 1 vol. fol., Paris, 1648; and Dr Giles, in 2 vols. 8vo, Oxford, 1844.

LANGELAND, an island of Denmark, in the Fühnen group and bailiwick of Svendborg, is situated between Laaland on the E., and Fühnen on the W., and stretches from the Great Belt on the N. to the Baltic Sea on the S. Its extreme length is 32 miles, its average breadth 4 miles, and its area nearly 80 geographical square miles. Its highest eminence, though not above 150 feet, exceeds in elevation the surrounding islands. The climate is salubrious; and the soil is rich, and produces flax, timber, corn, potatoes, and apples in abundance for exportation. A considerable number of cattle is reared, and fishing is extensively carried on. Although the water is very deep on both sides of the island, all harbourage of vessels is prevented on the

E. shore by a never-shifting current, that sweeps along an undented coast. But on the W. coast, the quietness of the sea, and the many creeks along the shore, afford an excellent roadstead and numerous havens. The island contains fifteen parishes, and has Rudkiöbing for its capital. Pop. (1851) 17,368.

LANGENSALZA, a town of Prussian Saxony, government of Erfurt, on the Salza, 19 miles N.W. from Erfurt. Its industrial population are employed in the production of silk, cotton, and woollen fabrics, gunpowder, saltpetre, starch, and other articles. A four-gated wall surrounds the town. Pop. (1849) 8279.

LANGENSCHWALBACH, a watering-place of Nassau, 8 miles N.W. from Wiesbaden, and 15 miles S.S.E. from Nassau. Its celebrity as a resort for English invalids dates from the publication of Head's *Bubbles*. Nearly 200,000 bottles of its mineral waters are exported every year. Pop. 2010.

LANGHOLM, a parish, burgh of barony, and market-town of Scotland, in the county of Dumfries, is situated on the River Esk, 25 miles E.N.E. from Dumfries. Manufactures cotton, woollen plaid, and other fabrics. In the market-place is a monument to Sir Pulteney Malcolm, and another on Langholm Hill to his brother, Sir John. Here were born Telford the engineer, and Meikle the translator of the *Lusiad*. Pop. of burgh (1851) 1406. Adjacent to Langholm is the village of New Langholm, occupied chiefly by weavers engaged in the woollen and linen manufactures. Pop. 1057.

LANGHORNE, JOHN, the English translator of *Plutarch's Lives*, was born in 1735 at Kirkby-Steven, in Westmoreland. He was educated first at Winton, and afterwards at Appleby; but being too poor to go directly to the university, he devoted himself to private teaching, took orders, and began to dabble in literature. In 1760 he entered Clare Hall, Cambridge, as a ten-year man, but does not seem to have taken his degree. He was at this time acting as private tutor in the family of a Lincolnshire gentleman, with whose daughter he fell in love. His suit was rejected, and he betook himself to London, where he became curate of St John's, Clerkenwell, and wrote largely for the periodical press. One of his best pieces was his poem entitled, *Genius and Valour*, in which he defended the Scottish nation against the fierce invective of Churchill's *Prophecy of Famine*. The University of Edinburgh, by the advice of Robertson the historian, acknowledged his goodwill with the degree of D.D. In the following year, 1767, he married the lady by whom he had been rejected some time before. Her friends were rich, and bought for him the living of Blagden, in Somersetshire; but in less than a year after her marriage his wife died in childbed. He felt her loss very keenly. Retiring to Folkestone, in Kent, he joined his brother, perpetual curate of that place. With his assistance he began the translation of Plutarch, which, when published in 1771, made his name widely known, and still preserves it from oblivion. In 1772 he married again, and four years later had the misfortune to lose his second wife from the same cause as the first. He was a man of strong domestic sympathies, and this double calamity quite unhinged his mind. To escape from his griefs, he plunged headlong into the social excitements, of which he had been always, though moderately fond. He died in 1779, in the forty-fifth year of his age. For the details of his life we are chiefly indebted to a memoir of him by his son, prefixed to a posthumous edition of his poems.

Langhorne was a very voluminous writer. His principal works, besides his *Plutarch*, are his *Letters on Religious Retirement*, dedicated to Warburton, 8vo, 1762; *Poetical Works*, 2 vols., 1776, and two volumes of Sermons. He also wrote largely for the press, especially for the *Monthly Review*, to which he contributed many essays and short

Langensalza
||
Langhorne.

Langland. tales. His translation of Plutarch is correct and literal, but very far from being what a translation of Plutarch ought to be. His poetical pieces never rise above neatness and good taste, but are easy and melodious, and sometimes strike chords of gentle pathos. His prose runs on smoothly and clearly, with no great originality or depth of thought. The manifest tendency to rhetoric is kept within bounds by the same good taste which marks his poetry.

LANGLAND, or LONGLAND, ROBERT, the reputed author of the *Visions of Piers Plowman*, was a native of Cleobury-Mortimer, in Shropshire. Of his personal history nothing is known beyond this, that he was a fellow of Oriel College, Oxford, that he entered the church and became a secular priest, that he lived in the times of Edward III. and Richard II., and that he was one of the earliest followers of Wycliffe. The dates of his birth and death are both unknown, but internal evidence fixes, approximately at least, the time when the *Visions* were written. One passage contains an allusion to the Treaty of Bretigny, made with France in 1360, and to the disasters which brought it about; another describes the great storm of January 15, 1362, as a recent event. "It is probable," says Mr Wright, in his edition of the *Visions*, "that the poem of Piers Plowman was written in the latter part of this year, when the effects of the great wind were fresh in people's memory, and when the Treaty of Bretigny had become a subject of popular discontent." According to Bale, the poem begun, or in hand this year, was completed in 1369.

The poem purports to be a series of visions seen by the author, when he fell asleep "on a May morwenynge," among the Malvern Hills. It consists of twenty "passus," or sections, each passus forming, or professing to form, a separate dream. The connection of the various dreams with each other is so ill-sustained, that the work may be regarded not so much as a single poem, as a succession of poems. The subject and the treatment are very much the same with the *Pilgrim's Progress* of Bunyan. A parallel has been drawn between the two works, suggested in the first instance by the similarity in the names of the personages, and borne out by a resemblance on many points far more important than that merely accidental one. But the general scope of the two allegories is widely different. The *Visions* are professedly satirical, and the satire being directed chiefly against the ignorance, irreligion, and immorality of the ecclesiastical orders. Interspersed are many passages of extraordinary poetical vigour, bursts of serious feeling, and sketches of external nature. These, however, are mere digressions, and the author always returns with new and sharper zest to his favourite theme. From the idea that the *Visions* were not only a religious, but also a kind of Protestant work, they were reprinted at the Reformation no fewer than three times in one year. The fact is, however, that the anti-clerical spirit in Langland is no more decided than it is in Chaucer. Many of the allegories are whimsically ingenious, and are good types of the kind of inventions in vogue in the poetry of the middle ages. The Lady Anima, who represents the soul of man, is placed by Kind, that is Nature, in a castle called Caro, or the Flesh; and the charge of it is committed to the Constable Sir In-wit, a wise knight, whose chief officers are his five sons, See-well, Say-well, Hear-well, Work-well, and Go-well. One of the other figures is Reason, who preaches in the church to the king and his knights, teaching that all the evils of the realm are because of sin. Among the vices who are converted by the sermon we

see Proud-heart, who vows to wear haircloth; Envy, lean, cowering, biting his lips, and wearing the sleeves of a friar's frock; and Covetousness, a bony, beetle-browed, bleary-eyed, ill-clothed caitiff. The metrical structure of the poem is accentual, and is, in fact, a revival of the old alliterative system of metre. Its success in its own day was so great as to prompt many imitations, all, without exception, quite inferior to the original.

The *Vision* has been often printed. There are two sets of MSS. of the poem, containing readings differing considerably from each other. The received version has been frequently published, but the last edition, that of 1842, by Thomas Wright, is beyond all comparison the best. The edition of 1813, by Dr Whitaker, follows the other texts, and is cumbrous, costly, and incorrect, while the glossary and notes are contemptible.

LANGON (the ancient *Alingo*), a town and river-port of France, in the department of Gironde, on the left bank of the Garonne, 25 miles S.S.E. from Bordeaux; its chief manufactures are casks and leather, and its trade is in ship timber, brandy, and the white wines of the district. Pop. 3950.

LANGRES (*Andomatunum Lingonum*), a fortified town of France, department of Haute-Marne, is situate on a hill, at the foot of which the Marne flows, 18 miles S.S.E. from Chaumont. From its excellent cutlery, it is often called the French Sheffield. It trades in cattle, hemp, wine, flour, corn, flax, whetstones, and other articles, and is important in a military point of view, as commanding the passage from the basin of the Saône into that of the Seine. Its cathedral of St Mammée is said to have been founded in 380. The ancient church of St Didier is now converted into a museum. There are also a town-house, a library of 7000 volumes, some hospitals, a communal college, a mercantile court, and a bishop's palace. Langres was the capital of the ancient Lingones, and contains many Roman remains, the principal of which is an arch erected in honour of the two Gordians, A.D. 240. Pop. (1851) 8646.

LANGSIDE, a small village of Scotland, county of Renfrew, 2 miles S. of Glasgow. Here the Regent Murray defeated Queen Mary in 1568.

LANGTON, STEPHEN, Archbishop of Canterbury, was born about the middle of the twelfth century, and is claimed as a son by the counties of Lincoln and Devon. The exact date and the exact spot of his birth are alike unknown. He studied at Paris, and in course of time became chancellor of the University of that city. Soon after the beginning of the thirteenth century he visited Rome. The reigning Pope (Innocent III.) not only made him cardinal of St Chrysogonus, but appointed him to the see of Canterbury, then vacant. John of England refused to sanction the choice of the pontiff, and his refusal led to that memorable contest, which resulted in his complete humiliation. (See ENGLAND, and *John of England*.) It was by Langton's advice that the English barons insisted upon the charter of Runnymede; but his unyielding assertion of their rights against the king, after John had been formally reconciled to the Papal see, brought him into disgrace with Innocent, who suspended him. Langton, however, retained office, and continued to administer the affairs of the church with his wonted skill and vigour till his death in 1228. In letters, Langton did too little to make himself a lasting name, but some small theological essays of his which have been published justify his character as an elegant and accomplished scholar.

Langon
Langton.

LANGUAGE.

Language. I.—ORIGIN OF LANGUAGE: REMARKS ON THE IDIOM AND GENIUS OF LANGUAGE.

Origin of Language. LANGUAGE, in the proper sense of the term, signifies the expression of our ideas and their various relations by certain articulate sounds, which are used as the signs of those ideas and relations. By articulate sounds are meant those modulations of the voice, or of sound emitted from the thorax, which are formed by means of the mouth and its several organs, the teeth, the tongue, the lips, and the palate. In a more general sense, *language* is sometimes used to denote all sounds by which animals of any kind express their particular feelings and impulses in a manner that is intelligible to their own species.

Nature has endowed every animal with powers sufficient to make known those sensations and desires with which it is necessary, for the preservation of the individual or the continuance of the kind, that others of the same species should be acquainted. For this purpose, the organs of all vocal animals are so formed as, upon any particular impulse, to utter sounds, of which those of the same species instinctively know the meaning. The summons of the hen is instantly obeyed by the whole brood of chickens; and in many others of the irrational tribes a similar mode of communication may be observed between the parents and the offspring, and also between one animal and another. But it is not amongst animals of the same species only that these instinctive sounds are mutually understood. It is as necessary for animals to know the voices of their enemies as those of their friends; and the roaring of the lion is a sound of which, previously to all experience, every beast of the forest is naturally afraid. Between these animal voices and the language of men, however, there is very little analogy. Human language is capable of expressing ideas and notions, which there is every reason to believe that the mind of the brutes cannot conceive. "Speech," says Aristotle, "is made to indicate what is expedient and what inexpedient, and, in consequence of this, what is just and unjust. It is therefore given to men, because it is peculiar to them, that of good and evil, just and unjust, they only, with respect to other animals, possess a sense or feeling." The voices of brutes seem intended by nature to express, not distinct ideas or moral modes, but only such feelings as it is for the good of the species that they should have the power of making known; and in this, as in all other respects, these voices are analogous, not to speaking, but to weeping, laughing, singing, groaning, screaming, and other natural and audible expressions of passion or appetite. Another difference between the language of men and the voices of brute animals consists in articulation, by which the former may be resolved into distinct elementary sounds or syllables; whereas the latter, being for the most part inarticulate, are not capable of such a resolution. Hence Homer and Hesiod characterize man by the epithet *μῆτιρ*, or *voice-dividing*, as denoting a power peculiar to the human species; for, though there are a few birds which utter sounds that may be divided into syllables, yet each of these birds utters but one such sound, which seems to be employed rather as a note of natural music than for the purpose of giving information to others; and hence, when the bird is agitated, it utters cries which are very different, and have no articulation.

A third difference between the language of men and the significant cries of brute animals is, that the former is the product of art, the latter derived from nature. Every human language is learned by imitation, and is intelligible only to those who either inhabit the country where it is vernacular, or have been taught it by a master or by books. But the voices in question are not learned by imitation; and being wholly instinctive, they are intelligible to all the animals of that species by which they are uttered, though brought together from the most distant countries on earth. That a dog, which had never heard another bark, would notwithstanding bark himself, and that the barkings or yelps of a Lapland dog would be instinctively understood by the dogs of Spain, Calabria, or any other country, are facts which do not admit of doubt. But there is no reason to imagine that a man, who had never heard any lan-

guage spoken, would himself speak; and it is well known that the language spoken in one country is unintelligible to the natives of another country where a different language is spoken. Indeed, it seems obvious, that were there any instinctive language, the first words uttered by all children would be the same; and that every child, whether born in the desert or in society, would understand the language of every other child, however educated or however neglected. Nay more, we may venture to affirm that such a language, though its general use might, in society, be superseded by the prevailing dialect of art, could never be wholly lost; and that no man of one country would find it difficult, far less impossible, to communicate the knowledge of his natural and most pressing wants to the men of any other country, whether barbarous or civilized. The exercise of cultivated reason, and the arts of civil life, have indeed eradicated many of our original instincts, but they have not eradicated all. [This is doubtful. It is generally believed that the dog, in its natural state, *howls*; it being only where contact with dogs, the companions of man, has (either directly or indirectly) taken place, that it *barks*. Again, children *do* form their earliest words alike, and that independent of imitation.—R. G. L.]

There are external indications of the internal feelings and desires, which appear in the most polished society, and which are confessedly instinctive. The passions, emotions, sensations, and appetites, are naturally expressed in the countenance by characters which the savage and the courtier can read with equal readiness. The serene look, the smoothed brow, the dimpled smile, and the glistening eye, denote equanimity and good will, in terms which no man can mistake. The contracted brow, the glaring eye, the sullen gloom, and the threatening air, denote rage, indignation, and defiance, as plainly and forcibly as revilings or imprecations. To teach men to disguise these instinctive indications of their temper, and

To carry smiles and sunshine in their face,
When discontent sits heavy at their heart,

constitutes a great part of modern manners. Yet, in spite of every effort of the utmost skill, and of every motive resulting from interest, the most consummate hypocrite, or the most hackneyed politician, is not always able to prevent his real disposition from becoming apparent in his countenance. He may, indeed, by long practice, acquire a great command over his temper, and the instinctive signs of it; but at times nature will predominate over art, and a sudden and violent passion will flash in his face, so as to be visible to the eye of every beholder. If these observations be just, and we flatter ourselves that no man will call them in question, it seems to follow, that if mankind were prompted by instinct to use articulate sounds as indications of their passions, affections, sensations, and ideas, the language of nature could never be wholly forgotten, and that it would sometimes predominate over the language of art. Groans, sighs, and some inarticulate lively sounds, are naturally expressive of pain and pleasure, and equally intelligible to all mankind. The occasional use of these no art can wholly banish; and if there were articulate sounds, naturally expressive of the same feelings, it is not conceivable that art or education could banish the use of them, merely because, by the organs of the mouth, they are broken into parts and resolvable into syllables.

It being thus evident that there is no instinctive articulated language, it has become an inquiry of some importance, how mankind were first induced to fabricate articulate sounds, and to employ them for the purpose of communicating their thoughts. Children learn to speak by insensible imitation; and when advanced some years in life they study foreign languages under proper instructors. But the first men had no speakers to imitate, and no foreign language to study. By what means, then, did they learn to speak? On this question only two opinions can possibly be formed. Either language must have been originally revealed from heaven, or it must be the fruit of human invention.

Language.

The latter opinion is strongly supported by Lord Monboddo in his very learned and able work on the *Origin and Progress of Language*. But he candidly acknowledges, that if language was invented, it was of very difficult invention, and far beyond the reach of the grossest savages. Accordingly he holds, that though men were originally solitary animals, and had no natural propensity to the social life; yet, before language could be invented, they must have been associated for ages, and have carried on in concert some common work. Nay, he is decidedly of opinion, that before the invention of an art so difficult as language, men must not only have herded together, but also formed some kind of civil polity, existed in that political state a very long time, and acquired such powers of abstraction as to be able to form general ideas. But it is obvious, that men could not have instituted civil polity or carried on in concert any common work, without communicating their designs to each other; and there are four ways by which the author thinks that this might have been done before the invention of speech, viz.,—1st, *Inarticulate cries*, expressive of sentiments and passions; 2d, *Gestures*, and *the expression of countenance*; 3d, *Imitative sounds*, expressive of audible things; and, 4th, *Painting*, by which visible objects may be represented.

Of these four ways of communication, it is plain that only two have any connection with language, inarticulate cries and imitative sounds; and of these the author abandons the latter as having contributed nothing to the invention of articulation, though he thinks it may have helped to advance its progress. "I am disposed," says he, "to believe, that the framing of words with an analogy to the sound of the things expressed by them, belongs rather to languages of art, than to the first languages spoken by rude and barbarous nations." It is, therefore, inarticulate cries only that must have given rise to the formation of language. Such cries are used by all animals who have any use of voice, to express their wants; and the fact is, that all barbarous nations have cries expressing different things, such as joy, grief, terror, surprise, and the like. These, together with gestures and expressions of the countenance, were undoubtedly the methods of communication first used by men. We have but to suppose, says our author, a great number of our species carrying on some common business, and conversing together by signs and cries; and we have men just in a state proper for the invention of language. For, if we suppose their numbers to have increased, their wants would also increase; and then these two methods of communication would become too confined for that larger sphere of life which their wants would make necessary. The only thing, then, that remained to be done, was to give a greater variety to the instinctive cries; and as the natural progress is from what is easy to what is more difficult, the first variation would be merely by tones from low to high, and from grave to acute. But this variety could not answer all the purposes of speech in society; and being advanced so far, it was natural that an animal so sagacious as man would go on farther, and come at last to the only other variation remaining, namely, articulation. The first articulation would be very simple, the voice being broken, and distinguished only by a few vowels and consonants. And as all natural cries are from the throat and larynx, with little or no operation of the organs of the mouth, it is natural to suppose, that the first languages were for the greater part spoken from the throat; that what consonants were used to vary the cries were mostly guttural; and that the organs of the mouth would at first be very little employed. From this account of the origin of language it appears, that the first sounds articulated were the natural cries by which men signified their wants and desires to one another, such as calling one another for certain purposes, and other such things as were most necessary for carrying on any joint work; then in process of time other cries would be articulated, to signify that such and such actions had been performed or were performing, or that such and such events had happened relative to the common business. The names of such objects as they were conversant with would be invented; but as we cannot suppose savages to be deep in abstraction, or skilful in the art of arranging things according to their *genera* and *species*, all things, however similar, except, perhaps, the individuals of the lowest species, would be expressed by different words not related to each other either by derivation or composition. Thus would language grow by degrees; and as it grew, it would be

more and more broken and articulated by consonants; but still Language. the words would retain a great deal of their original nature of animal cries. And thus things would go on, words unrelated still multiplying, till at last the language would become too cumbersome for use, and then art would be obliged to interpose, and form a language upon a few radical words, according to the rules and method of etymology.

Those who think that language was originally revealed from heaven, consider this account of its human invention as a series of mere suppositions hanging loosely together, and the whole suspended from no fixed principle. The opinions of Diodorus, Vitruvius, Horace, Lucretius, and Cicero, which are frequently quoted in its support, are in their estimation of no greater authority than the opinions of other men; for as language was formed and brought to a great degree of perfection long before the era of any historian with whom we are acquainted, the antiquity of the Greek and Roman writers, who are comparatively of yesterday, gives them no advantage in this inquiry over the philosophers of France and England. Aristotle has defined man to be a *ζῷον μιμητικόν*, or imitative animal; and the definition is certainly so far just, that man is much more remarkable for imitation than invention; therefore, say the reasoners on this side of the question, had the human race been originally *mutum et turpe pecus*, they would have continued so to the end of time, unless they had been taught to speak by some superior intelligence. That the first men sprung from the earth like vegetables, no modern philosopher has ventured to assert; nor does there anywhere appear sufficient evidence that men were originally in the state of savages. The oldest book extant contains the only rational cosmogony known to the ancient nations; and that book represents the first human inhabitants of this earth, not only as reasoning and speaking animals, but also as in a state of high perfection and happiness, of which they were deprived for disobedience to their Creator. Moses, setting aside his claim to inspiration, deserves, from the consistency of his narrative, at least as much credit as Moschus, or Democritus, or Epicurus; and, from his prior antiquity, if antiquity could on this subject have any weight, he would deserve more, as having lived nearer to the period of which they all write. But the question respecting the origin of language may be decided without resting on authority of any kind, merely by considering the nature of speech, and the mental and corporeal powers of man. Those who maintain it to be of human invention, suppose men at first to have been solitary animals, afterwards to have herded together without government or subordination, then to have formed political societies, and by their own exertions to have advanced from the grossest ignorance to the refinements of science. But, say the reasoners, whose cause we are now pleading, this is a supposition contrary to all history and all experience. There is not upon record a single instance well authenticated of a people emerging by their own efforts from barbarism to civilization. There have indeed been many nations raised from the state of savages; but it is known that they were polished, not by their own repeated exertions, but by the influence of individuals or colonies from nations more enlightened than themselves. The original savages of Greece were tamed by the Pelasgi, a foreign tribe; and were afterwards further polished by Orpheus, Cecrops, Cadmus, and others, who derived their knowledge from Egypt and the East. The ancient Romans, a ferocious and motley crew, received the blessings of law and religion from a succession of foreign kings; and the conquests of Rome, at a later period, contributed to civilize the rest of Europe. In America, the only two nations which, at the invasion of the Spaniards, could be said to have advanced a single step from barbarism, were indebted for their superiority over the other tribes, not to the gradual and unassisted progress of the human mind, but to the wise institutions of foreign legislators.

This is not the proper place for tracing the progress of man from the savage state to that of political society; but experience teaches us, that in every art it is much easier to improve than to invent? The human mind, when put into the proper track, is indeed capable of making great advances in arts and sciences; but, if any credit is due to the records of history, it has not, in a people sunk in ignorance and barbarity, sufficient vigour to discover that track, or to conceive a state different from the present. If the rudest inhabitants of America and

Language. other countries have continued, as there is every reason to believe they have continued, for ages in the same unvaried state of barbarism; how is it imaginable that people so much ruder than they as to be ignorant of all language, should think of inventing an art so difficult as that of speech, or even to frame a conception of the thing. In building, fishing, hunting, navigating, and the like, they might imitate the instinctive arts of other animals, but there is no other animal that expresses its sensations and affections by arbitrary articulate sounds. It is said, that before language could be invented, mankind must have existed for ages in large political societies, and have carried on in concert some common work; but if inarticulate cries, and the natural visible signs of the passions and affections, were modes of communication sufficiently accurate to keep a large society together for ages, and to direct its members in the execution of some common work, what could be their inducement to the invention of an art so useful and difficult as that of language?

Let us however suppose, say the advocates for the cause which we are now supporting, that different nations of savages set about inventing an art of communicating their thoughts, which experience had taught them was not absolutely necessary; how came they all, without exception, to think of the one art of articulating the voice for this purpose? Inarticulate cries, out of which language is fabricated, have indeed an instinctive connection with our passions and affections; but there are gestures and expressions of countenance with which our passions and affections are in the same manner connected. If the natural cries of passion could be so modified and enlarged as to be capable of communicating to the hearer every idea in the mind of the speaker, it is certain that the natural gestures could be so modified as to answer the very same purpose; and it is strange that, among the several nations who invented languages, not one should have stumbled upon fabricating visible signs of their ideas, but that all should have agreed to denote them by articulated sounds. Every nation whose language is narrow and rude, supplies its defects by a violent gesticulation; and therefore, as much less genius is exerted in the improvement of any art than was requisite for its first invention, it is natural to suppose that, had men been left to devise for themselves a method of communicating their thoughts, they would not have attempted any other than that by which they now improve the language transmitted by their fathers. It is vain to urge that articulate sounds are fitter for the purpose of communicating thought than visible gesticulation; for, though this may be true, it is a truth which could hardly occur to savages, who had never experienced the fitness of either; and if, to counterbalance the superior fitness of articulation, its extreme difficulty be taken into view, it must appear little less than miraculous that every savage tribe should think of it rather than the easier method of artificial gesticulation. Savages, it is well known, are remarkable for their indolence, and for always preferring ease to utility; but their modes of life give such pliancy to their bodies, that they could with very little trouble bend their limbs and members into any positions agreed upon as the signs of ideas. This is so far from being the case with respect to the organs of articulation, that it is with extreme difficulty, if at all, that a man advanced in life can be taught to articulate any sound which he has not been accustomed to hear. No foreigner who comes to England after the age of thirty ever pronounces the language tolerably well; an Englishman of that age can hardly be taught to utter the guttural sound which a Scotsman gives to the Greek χ , or even the French sound of the vowel τ ; and of the solitary savages who have been caught in different forests, we know not that there has been one who, after the age of manhood, learned to articulate any language so as to make himself readily understood. The present age has indeed furnished many instances of deaf persons being taught to speak intelligibly by skillful masters moulding the organs of the mouth into the positions proper for articulating the voice; but who was to perform this task amongst the inventors of language, when all mankind were equally ignorant of the means by which articulation is effected? In a word, daily experience informs us, that men who have not learned to articulate in their childhood, never afterwards acquire the faculty of speech but by such helps as savages cannot obtain; and therefore, if speech was invented at all, it must have been

Language. either by children who were incapable of invention, or by men who were incapable of speech. A thousand, nay, a million, of children could not think of inventing a language. While the organs are pliable, there is not understanding enough to frame the conception of a language; and by the time that there is understanding, the organs are become too stiff for the task, and therefore, say the advocates for the divine origin of language, reason as well as history intimates, that mankind in all ages must have been speaking animals—the young having constantly acquired this art by imitating those who were older; and we may warrantably conclude, that our first parents received it by immediate inspiration.

To this account of the origin of language an objection readily offers itself. If the first language was communicated by inspiration, it must have been perfect, and held in reverence by those who spake it, in other words, by all mankind. But a vast variety of languages have prevailed in the world; and some of these which remain are known to be very imperfect, whilst there is reason to believe that many others are lost. If different languages were originally invented by different nations, all this would naturally follow from the mixture of these nations; but what could induce men possessed of one perfect language of divine original, to forsake it for barbarous jargons of their own invention, and in every respect inferior to that with which their forefathers or themselves had been inspired?

In answer to this objection, it is said, that nothing was given by inspiration but the faculty of speech and the elements of language; for, when once men had language, it is easy to conceive how they might have modified it by their natural powers, as thousands can improve what they could not invent. The first language, if given by inspiration, must, in its principles, have had all the perfection of which language is susceptible; but from the nature of things it could not possibly be very copious. The words of language are either proper names or the signs of ideas and relations; but it cannot be supposed that the All-wise Instructor would load the memories of men with words to denote things then unknown, or with the signs of ideas which they had not then acquired. It was sufficient that a foundation was laid of such a nature as would support the largest superstructure which they might ever after have occasion to raise upon it, and that they were taught the method of building by composition and derivation. This would long preserve the language radically the same, though it could not prevent the introduction of different dialects in the different countries over which men spread themselves. In whatever region we suppose the human race to have been originally placed, the increase of their numbers would, in process of time, either disperse them into different nations, or extend the one nation to a vast distance on all sides from what we may call the seat of government. In either case they would everywhere meet with new objects, which would occasion the invention of new names; and as the difference of climate and other natural causes would compel those who removed eastward or northward to adopt modes of life in many respects different from the modes of those who travelled towards the west or the south, a vast number of words would in one country be fabricated to denote complex conceptions, which must necessarily be unintelligible to the body of the people inhabiting countries where those conceptions had never been formed. Thus would various dialects be unavoidably introduced into the original language, even whilst all mankind remained in one society and under one government. But after separate and independent societies were formed, these variations would become more numerous, and the several dialects would deviate farther and farther from each other, as well as from the idiom and genius of the parent tongue, in proportion to the distance of the tribes by whom they were spoken.

[This is not sufficient. Languages ought, by hypothesis, to graduate into each other more than they do. In order to account for the existing lines of demarcation, which are broad and definite, we must bear in mind a fresh phenomenon, viz., the spread of one dialect at the expense of others, a fact which obliterates intermediate forms, and brings extreme ones into geographical juxtaposition.]

And here it may be noticed, that the distribution of languages over the earth's surface is irregular. In all the quarters of the world we find the two kinds of areas contrasted with one another. In the one, a single language, with a

Language. *minimum* amount of dialectual difference, is spread over a vast extent of country; in the other, a multiplicity of mutually unintelligible forms of speech is found within a small compass.

In Europe, the Slavonic tongues have a large, the Biscayan a small area.

In Asia, the Turk area is large, that of the languages of Caucasus, Nepaul, &c., small.

In Africa, the Berber is large, and certain Abyssinian and other areas small.

In Polynesia, the Malay and Polynesian are large, the Papuan area small.

In America there are numberless small areas; but the Algonkin, Guarani, and a few others, are large.—R. G. L.]

If we suppose a few people either to have been banished together from the society of their brethren, or to have wandered of their own accord to a distance, from which, through trackless forests, they could not return (and such emigrations have often taken place), it is easy to see how the most copious language must in their mouths have soon become narrow, and how the offspring of inspiration must have in time become so deformed as hardly to retain a feature of the ancestor whence it originally sprung. Men do not long retain a practical skill in those arts which they never exercise; and there are abundance of facts to prove, that a single man cast upon a desert island, and having to provide the necessities of life by his own ingenuity, would soon lose the art of speaking with fluency his mother tongue. A small number of men cast away together, would indeed retain that art somewhat longer; but in a space of time not very long, it would in a great measure be lost by them or their posterity. In this state of banishment, as their time would be almost wholly occupied in hunting, fishing, and other means within their reach, to support a wretched existence, they would have very little leisure, and perhaps less desire, to preserve by conversation the remembrance of that ease and those comforts of which they now found themselves for ever deprived: and they would of course soon forget all the words which in their native language had been used to denote the accommodations and elegancies of polished life. This at least seems to be certain, that they would not attempt to teach their children a part of language which in their circumstances could be of no use to them, and of which it would be impossible to make them comprehend the meaning; for where there are no ideas, the signs of ideas cannot be made intelligible. From such colonies as this, dispersed over the earth, it is probable that all those nations of savages have arisen, which have induced so many philosophers to imagine that the state of the savage was the original state of man; and if so, we see that from the language of inspiration must have unavoidably sprung a number of different dialects, all extremely rude and narrow, and retaining nothing of the parent tongue, except perhaps the names of the most conspicuous objects of nature, and of those wants and enjoyments which are inseparable from humanity. The savage state has no artificial wants, and

furnishes few ideas that require *terms* to express them. The Language. habits of solitude and silence incline a savage rarely to speak; and when he speaks, he uses the same terms to denote different ideas. Speech, therefore, in this rude condition of men, must be extremely narrow, and extremely various. Every new region, and every new climate, suggests different ideas, and creates different wants, which must be expressed either by terms entirely new, or by old terms used with a new signification. Hence must originate great diversity, even in the first elements of speech, among all savage nations, the words retained of the original language being used in various senses, and pronounced, as we may believe, with various accents.

When any of those savage tribes emerged from their barbarism, whether by their own efforts or by the aid of people more enlightened than themselves, it is obvious that the improvement and copiousness of their language would keep pace with their own progress in knowledge, and in the arts of civil life; but, in the infinite multitude of words which civilization and refinement add to language, it would be little less than miraculous were any two nations to agree upon the same sounds to represent the same ideas. Superior refinement, indeed, may induce imitation, conquests may impose a language, and extension of empires may melt down different nations and different dialects into one mass; but independent tribes naturally give rise to diversity of tongues; nor does it seem possible that they should retain more of the original language than the words expressive of those objects with which all men are at all times equally concerned. The variety of tongues, therefore, the copiousness of some, and the narrowness of others, furnish no good objection to the divine origin of language in general; for, whether language was at first revealed from heaven, or in a course of ages invented by men, a multitude of dialects would inevitably arise as soon as the human race had separated into a number of distinct and independent nations.¹

As the knowledge of languages constitutes a great part of *Idiom* and erudition, as their beauties and deformities furnish employ- *genius of* ment to taste, and as these depend much upon the idioms of language. the different tongues, we shall proceed to make a few remarks upon the advantages and defects of some of those idioms of language with which we are best acquainted. As the words *idiom* and *genius* of a language are often confounded, it will be necessary to inform the reader, that by *idiom* we would here be understood to mean that general mode of arranging words into sentences which prevails in any particular language; and by the *genius* of a language, we mean to express the particular set of ideas which the words of any language, either from their formation or multiplicity, are most naturally apt to excite in the mind of any one who hears it properly uttered. Thus, although the English, French, Italian, and Spanish languages nearly agree in the same general *idiom*, yet the particular *genius* of each is remarkably different. The English is naturally bold, nervous, and strongly articulated; the French is weaker, and more flowing; the Italian

¹ In the foregoing view of this subject, the argument for the supernatural origin of language is evidently that which the author wishes to favour. But though we have, with some slight alterations, reprinted this part of the article, which was written for the earlier editions of this work, we are far from adopting the very unphilosophical opinion which it supports. We do not assert, because we could have nothing like evidence for such an assertion, that the Deity did not originally bestow on man the gift of speech; but we think, with Lord Monboddo, and many others, that if such a boon ever was conferred, it must, in the revolutions and calamities that have befallen the human race, inevitably have been lost; and, therefore, that as multitudes of languages exist and have ever existed, the art of speech is one which man is capable of attaining to, independently of any supernatural aid. This is the view taken by our best philosophers. Thus, Mr Stewart, notwithstanding his well-known caution in forming conclusions on momentous subjects, unhesitatingly avows his conviction, that "the human faculties are competent to the formation of language." (*Philosophy of the Mind*, vol. iii., chap. I.) In another place, the same admirable writer makes the following philosophical observations on this subject:—"The steps in the formation of language cannot probably be determined with certainty; yet if we can show, from the known principles of human nature, how the various parts may naturally have arisen, the mind is not only to a certain degree satisfied, but a check is given to that indolent philosophy which refers to a miracle whatever appearances, either in the natural or moral world, it is unable to explain." One of the most ingenious attempts that ever has been made to show by what steps the human mind would naturally proceed in the acquisition of speech, is that contained in Dr Adam Smith's "Considerations on the Formation of Languages." His theory may perhaps be liable to objection in some of its details; but it is developed with singular clearness and simplicity; and it must, in its general scope and design, be allowed by all candid and competent judges to be eminently philosophical. This essay was annexed by its author to the first edition of his *Theory of Moral Sentiments*; and we are told by Mr Stewart, that he always regarded it with great partiality, and that he reprinted it, without a single alteration, in the last edition of that work which he himself revised. Mr Stewart's commentary upon it (*Philosophy of the Mind*, ubi supra) ought to be perused along with it. [The phenomena of languages are those of Growth and Development, rather than those of an organic whole invented at once. The process by which these phenomena are studied is all that can here be noticed. We begin with language as it exists at present, and eliminate whatever we can trace to a recent origin, e.g., abstract terms, conjunctions, inflections, &c. Doing this, though we never come to the original nucleus of language, we soon become satisfied that that was exceedingly small.—R. G. L.]

Language. more soothing and harmonious ; and the Spanish more grave, sonorous, and stately. Now, when we examine the several languages which have been most esteemed in Europe, we find that there are only two *idioms* among them which are essentially distinguished from one another ; and all those languages are divided between those two idioms, following sometimes the one and sometimes the other, either wholly or in part. The languages which may be said to adhere to the first *idiom*, are those which, in their construction, follow the order of nature ; that is, express their ideas in the natural order in which they occur to the mind ;—the subject which occasions the action appearing first ; then the action accompanied with its several modifications ; and, last of all, the object to which it has reference. These may properly be called *analogous* languages ; and of this kind are the English, French, and most of the modern languages in Europe. The languages which may be referred to the other *idiom*, are those which follow no other order in their construction than what the taste or fancy of the composer may suggest ; sometimes making the object, sometimes the action, and sometimes the modification of the action, to precede or follow the other parts. The confusion which this might occasion is avoided by the particular manner of *inflecting* their words, by which they are made to refer to the others with which they ought to be connected, in whatever part of the sentence they occur, the mind being left at liberty to connect the several parts with one another after the whole sentence is concluded ; and as the words may be here transposed at pleasure, those languages may be called *transpositive* languages. To this class we must, in an especial manner, refer the Latin and Greek languages. As each of these *idioms* has several advantages and defects peculiar to itself, we shall endeavour to point out the most considerable of them, in order to ascertain with greater precision the particular character and excellence of some of those languages now principally spoken or studied in Europe.

The partiality which our forefathers, at the revival of letters in Europe, naturally entertained for the Greek and Roman languages, made them look upon every distinguishing peculiarity belonging to them as *one* of the *many* causes of the amazing superiority which those languages evidently enjoyed above every other at that time spoken in Europe. This blind deference still continues to be paid to them, as our minds are early prepossessed with these ideas, and as we are taught in our earliest infancy to believe, that to entertain the least idea of our own language being equal to the Greek or Latin in any particular whatever, would be a certain mark of ignorance or want of taste. Their rights, therefore, like those of the church in former ages, remain still to be examined ; and we, without exerting our reason to discover truth from falsehood, tamely sit down satisfied with the idea of their undoubted pre-eminence in every respect. But if we look around us for a moment, and observe the many excellent productions which are to be met with in almost every language of Europe, we must be satisfied that *even these* are now possessed of *some* powers which might afford at least a presumption, that if they were cultivated with a proper degree of attention, they might, in *some respects*, be made to rival, if not to excel, those beautiful and justly admired remains of antiquity. Without endeavouring to derogate from their merit, let us, with the cool eye of philosophic reasoning, endeavour to bring before the sacred tribunal of truth some of those opinions which have been most generally received upon this subject, and rest the determination of the cause on her impartial decision.

The learned reader well knows, that the several changes which take place in the arrangement of the words in every *transpositive* language, could not be admitted without occasioning great confusion, unless certain classes of words were endowed with particular variations, by means of which they might be made to refer to the other words with which they ought naturally to be connected. From this cause proceeds the necessity of several variations of *verbs, nouns, and adjectives* ; which are not in the least essential or necessary in the *analogous* languages, as we have pretty fully explained under the article GRAMMAR, to which we refer for satisfaction on this head. We shall, in this place, consider whether these variations are an advantage or a disadvantage to language.

As it is generally supposed that every language, the verbs of which admit of *inflection*, is on that account much more

perfect than one where they are varied by *auxiliaries*, we shall, in the first place, examine this with some degree of attention ; and, that what is said on this head may be the more intelligible, we shall give examples from the Latin and English languages. We make choice of these languages, because the Latin is more purely *transpositive* than the Greek, and the English admits of less *inflection* than any other language that we are acquainted with.

If any preference be due to a language from the one or the other method of *conjugating* verbs, it must in a great measure be owing to one or other of these three causes : Either it must admit of a greater variety of sounds, and consequently afford more scope for harmonious diversity of tones in the language ; or a greater freedom of expression is allowed in uttering any simple idea, by the one admitting of a greater variety in the arrangement of the words which are necessary to express that idea than the other does ; or, lastly, a greater precision and accuracy in fixing the meaning of the person who uses the language, arise from the use of one of these forms rather than from the use of the other. For, as all the other circumstances which may serve to give a diversity to language, such as the general and most prevalent sounds, the frequent repetition of any one particular letter, and a variety of other circumstances of that nature, which may serve to debase a particular language, are not influenced in the least by the different methods of varying the verbs, they cannot be here considered. We shall therefore proceed to make a comparison of the advantages or disadvantages which may accrue to a language by inflecting its verbs, with regard to the variety of sound, variety of arrangement, and accuracy of meaning.

The first particular that we have to examine is, whether the one method of expressing the variations of a verb admits of a greater variety of sounds. In this respect the Latin seems, at first view, to have a great advantage over the English ; since the words, *amo, amabam, amaveram, amavero, amem, &c.*, seem to be more different from one another than the English translations of these, *I love, I was loving, I had loved, I shall have loved, I may love, &c.* ; for although the syllable *am* is repeated in every one of the first, yet, as the last syllable usually strikes the ear with greater force, and leaves a greater impression than the first, it is very probable that many will think the frequent repetition of the word *love*, in the last instance, more striking to the ear than the repetition of *am* in the former. We will therefore allow this its full weight, and grant that there is as great, or even a greater, difference between the sounds of the different *tenses* of a Latin verb, than there is between the words that are equivalent to them in English. But as we here consider the variety of sounds of the language in general, before any just conclusion can be drawn, we must not only compare the different parts of the same verb, but also compare the different verbs with one another in each of these languages. And here, at first view, we perceive a most striking distinction in favour of the *analogous* language over the *inflected* ; for, as it would be impossible to form a particular set of inflections, different from one another, for each particular verb, all those languages which have adopted this method have been obliged to reduce their verbs into a small number of classes, all the words of each of which classes, commonly called *conjugations*, have the several variations of the *moods, tenses, and persons*, expressed exactly in the same manner, which must of necessity introduce a similarity of sounds into the language in general, much greater than where every particular verb always retains its own distinguishing sound. To be convinced of this, we need only repeat any number of verbs in Latin and English, and observe on which side the preference with respect to variety of sounds must fall.

Pono,	<i>I put.</i>	Moveo,	<i>I move.</i>
Dono,	<i>I give.</i>	Doleo,	<i>I ail.</i>
Cano,	<i>I sing.</i>	Lugeo,	<i>I mourn.</i>
Sono,	<i>I sound.</i>	Obeo,	<i>I die.</i>
Orno,	<i>I adorn.</i>	Gaudeo,	<i>I rejoice.</i>
Pugno,	<i>I fight.</i>	Incipio,	<i>I begin.</i>
Lego,	<i>I read.</i>	Facio,	<i>I make.</i>
Scribo,	<i>I write.</i>	Fodio,	<i>I dig.</i>
Puto,	<i>I think.</i>	Rideo,	<i>I laugh.</i>
Vivo,	<i>I love.</i>	Impleo,	<i>I fill.</i>
Ambulo,	<i>I walk.</i>	Abstineo,	<i>I forbear.</i>

Language.

The similarity of sounds is here so obvious in the Latin, as to be perceived at the first glance; nor can we be surprised to find it so, when we consider that all their regular verbs, amounting to four thousand or upwards, must be reduced to four conjugations, and even these differing but little from one another, which must of necessity produce the sameness of sounds which we here perceive; whereas, every language that follows the natural order, like the English, instead of this small number of uniform terminations, has almost as many distinct sounds as original verbs.

But if, instead of the present of the indicative mood, we should take almost any other tense of the Latin verb, the similarity of sounds would still be more perceptible, as many of these tenses have the same termination in all the four conjugations, particularly in the imperfect of the indicative, as below:—

Pone-bam,	<i>I did put,</i>	or <i>was putting.</i>
Dona-bam,	<i>I did give,</i>	or <i>was giving.</i>
Cane-bam,	<i>I did sing,</i>	or <i>was singing.</i>
Sona-bam,	<i>I did sound,</i>	or <i>was sounding.</i>
Orna-bam,	<i>I did adorn,</i>	or <i>was adorning.</i>
Pugna-bam,	<i>I did fight,</i>	or <i>was fighting.</i>
Lege-bam,	<i>I did read,</i>	or <i>was reading.</i>
Scribe-bam,	<i>I did write,</i>	or <i>was writing.</i>
Putā-bam,	<i>I did think,</i>	or <i>was thinking.</i>
Vive-bam,	<i>I did live,</i>	or <i>was living.</i>
Ambula-bam,	<i>I did walk,</i>	or <i>was walking.</i>
Move-bam,	<i>I did move,</i>	or <i>was moving.</i>
Dole-bam,	<i>I did ail,</i>	or <i>was ailing.</i>
Luge-bam,	<i>I did mourn,</i>	or <i>was mourning.</i>
Obi-bam,	<i>I did die,</i>	or <i>was dying.</i>
Gaude-bam,	<i>I did rejoice,</i>	or <i>was rejoicing.</i>
Incipie-bam,	<i>I did begin,</i>	or <i>was beginning.</i>
Facie-bam,	<i>I did make,</i>	or <i>was making.</i>
Fodie-bam,	<i>I did dig,</i>	or <i>was digging.</i>
Ride-bam,	<i>I did laugh,</i>	or <i>was laughing.</i>
Imple-bam,	<i>I did fill,</i>	or <i>was filling.</i>
Abstine-bam,	<i>I did forbear,</i>	or <i>was forbearing.</i>

It is unnecessary to make any remarks on the Latin words in this example. But in the English translation we have carefully marked in the first column the words without any inflection; and in the second, have put down the same meaning by an inflection of our verb; which we have been enabled to do, from a peculiar excellency in our own language unknown to any other, either ancient or modern. Were it necessary to pursue this subject farther, we might observe, that the *perfect* tense in all the conjugations ends universally in *i*, the *pluperfect* in *eram*, and the *future* in *am* or *bo*; in the subjunctive mood the *imperfect* universally in *em*, the *perfect* in *erim*, the *pluperfect* in *issem*, and the *future* in *ero*; and as a still greater sameness is observable in the different variations for the persons in these tenses, seeing the first person plural in all tenses ends in *mus*, and the second person in *ris*, with little variation in the other persons, it is evident that, in respect to diversity of sounds, this method of conjugating verbs by *inflection* is greatly inferior to the more natural method of expressing the various connections and relations of the verbal attribute by different words, usually called *auxiliaries*.

The second particular by which the different methods of marking the relation of the verbal attribute can affect language, arises from the variety of expressions which either of these may admit of in uttering the same sentiment. In this respect likewise, the method of conjugation by inflection seems to be deficient. Thus the present of the indicative mood in Latin can at most be expressed only in two ways, viz., *scribo* and *ego scribo*, which ought, perhaps, in strictness to be admitted only as one; whereas, in English, we can vary it in four different ways, viz.,—1st, *I write*; 2dly, *I no write*;

3dly, *WRITE I do*; 4thly, *WRITE DO I*.¹ And if we consider Language. the further variation which these receive in power as well as in sound, by having the emphasis placed on the different words, instead of four we will find eleven different variations. Thus, *I write*, with the emphasis upon the *I*; *I write*, with the emphasis upon the word *write*. Let any one pronounce these with the different emphasis necessary, and he will be immediately satisfied that they are not only distinct from each other with respect to meaning, but also with regard to sound. The same must be understood of all the other parts of this example:—

<i>I do write.</i>	<i>Write I DO.</i>
<i>I DO write.</i>	<i>WRITE DO I.</i>
<i>I do WRITE.</i>	<i>Write DO I.</i>
<i>WRITE I do.</i>	<i>Write DO I.</i>
<i>Write I do.</i>	

None of the Latin tenses admit of more variations than the two above mentioned: nor do almost any of the English admit of fewer than in the above example; and several of these phrases, which must be considered as exact translations of some of the tenses of the Latin verb, admit of many more. Thus the imperfect of the subjunctive mood, which in Latin admits of the above two variations, admits in English of the following:—

<i>I might have written.</i>	<i>Written might have I.</i>
<i>Written I might have.</i>	<i>I written might have.</i>
<i>Have written I might.</i>	<i>Have written might I.</i>

And if we likewise consider the variations which may be produced by a variation of the emphasis, they will be as under:—

<i>I might have written.</i>	<i>WRITTEN might have I.</i>
<i>I MIGHT have written.</i>	<i>Written MIGHT have I.</i>
<i>I might HAVE written.</i>	<i>Written might HAVE I.</i>
<i>I might have WRITTEN.</i>	<i>Written might have I.</i>
<i>WRITTEN I might have.</i>	<i>I written might have.</i>
<i>Written I might have.</i>	<i>I WRITTEN might have.</i>
<i>Written I MIGHT have.</i>	<i>I written MIGHT have.</i>
<i>Written I might HAVE.</i>	<i>I written might HAVE.</i>
<i>HAVE written I might.</i>	<i>HAVE written might I.</i>
<i>Have WRITTEN I might.</i>	<i>Have WRITTEN might I.</i>
<i>Have written I might.</i>	<i>Have written MIGHT I.</i>
<i>Have written I MIGHT.</i>	<i>Have written might I.</i>

In all, twenty-four variations, instead of two. If we likewise consider that the Latins were obliged to employ the same word, not only to express "*I might have written*," but also, "*I could*," "*I would*," or "*I should have written*," each of which would admit of the same variations as the word *might*, we have in all *ninety-six* different expressions in English for the same phrase, which in Latin admits only of two, unless they have recourse to other forced turns of expression, which the defects of their verbs in this particular has compelled them to invent.

But if it should be objected that the last circumstance we have taken notice of as a defect can only be considered as a defect of the Latin language, and is not to be attributed to the inflection of their verbs, seeing they might have had a particular tense for each of these different words *might*, *could*, *would*, and *should*; we answer, that, even admitting this excuse to be valid, the superiority of the analogous language as such still remains in this respect as twelve to one. Yet even this concession is greater than ought to have been made. For as the difficulty of forming a sufficient variety of words for all the different modifications which a verb may be made to undergo is too great for any rude people to overcome, we find, that every nation which has adopted this mode of inflection, not excepting the Greeks themselves, has been obliged to remain satisfied with fewer words than would have been necessary even to effect this purpose, and make the same word serve a double, triple,

¹ We are sufficiently aware that the last variation cannot in strictness be considered as good language, although many examples of this manner of using it in serious composition, both in poetry and prose, might easily be produced from the best authors in the English language. But, however unjustifiable it may be to use it in serious composition, yet, when judiciously employed in works of humour, this and other forced expressions of the like nature produce a fine effect, by giving a burlesque air to the language, and beautifully contrasting it with the purer diction of solid reasoning. Shakespeare has on many occasions showed how successfully these may be employed in composition, particularly in drawing the character of Ancient Pistol in Henry V. Without this liberty, Butler would have found greater difficulty in drawing the inimitable character of Hudibras. Let this apology suffice for having inserted this and other variations of the same kind, which, although they may be often improper for serious composition, have still their use in language.

Language. or even quadruple office, as in the Latin tense which gave rise to these observations. So that, however, in physical necessity this may not be chargeable upon the particular mode of construction, yet in moral certainty it must always be the case; and, therefore, we may safely conclude, that the mode of varying verbs by inflection affords less variety in the arrangement of the words of the particular phrases, than the method of varying them by the help of auxiliaries.

But if there should still remain any shadow of doubt in the mind of the reader, whether the method of varying the verbs by *inflection* is inferior to that by *auxiliaries*, with regard to diversity of sounds or variety of expression, there cannot be the least doubt that, with respect to precision, distinctness, and accuracy in expressing any idea, the latter enjoys a superiority beyond all comparison. Thus, the Latin verb *amo* may be Englished either by the words *I love* or *I do love*, and the emphasis placed upon any of the words that the circumstances may require; by means of which the meaning is pointed out with a force and energy which it is altogether impossible to produce by the use of any single word. The following line from Shakspeare's *Othello* may serve as an example:—

“Excellent wretch!
Perdition catch my soul, but *I do love thee*.”

Here the strong emphasis on the word *do* gives it a force and energy which conveys, in an irresistible manner, a most perfect knowledge of the situation of the mind of the speaker at the time. That the whole energy of the expression depends upon this seemingly insignificant word, we may be at once satisfied of by keeping it away, in this manner:—

“Excellent wretch!
Perdition catch my soul, but *I love thee*.”

How poor, how tame, how insignificant is this, when compared with the other. Here nothing remains but a tame assertion, ushered in with a pompous exclamation, which could not here be introduced with any degree of propriety. Whereas, in the way that Shakspeare has left it to us, it has an energy which nothing can surpass; for, overpowered with the irresistible force of Desdemona's charms, this strong exclamation is extorted from the soul of Othello in spite of himself. Surprised at this tender emotion, which brings to his mind all those amiable qualities for which he had so much esteemed her, and at the same time fully impressed with the firm persuasion of her guilt, he bursts out into that seemingly inconsistent exclamation,—*Excellent wretch!* and then he adds in the warmth of his surprise, thinking it a thing most astonishing that any warm affection should still remain in his breast,—he even confirms it with an oath,—*Perdition catch my soul, but I do love thee*. “In spite of all the falsehoods with which I know thou hast deceived me, in spite of all the crimes of which I know thee guilty, in spite of all those reasons for which I ought to hate thee, in spite of myself, still I find that I love, yes, I do love thee.” We look upon it as a thing altogether impossible to transmute the energy of this expression into any language whose verbs are regularly inflected.

In the same manner we might go through all the other tenses, and show that the same superiority is to be found in each. Thus, in the *perfect tense* of the Latins, instead of the simple *AMAVI*, we say *I HAVE LOVED*; and by the liberty we have of putting the emphasis upon any of the words which compose this phrase, we can in the most accurate manner fix the precise idea which we mean to excite; for, if we say, *I have loved*, with the emphasis upon the word *I*, it at once points out the person as the principal object in that phrase, and makes us naturally look for a contrast in some other person, and the other parts of the phrase become subordinate to it: “*He has loved thee much, but I have loved thee infinitely more*.” The Latins, too, as they were not prohibited from joining the pronoun with their verb, were also acquainted with this excellence, which Virgil has beautifully used in this verse:—

“*Nos patriam fugimus;*
Tu, Tityre, lentus in umbra,” &c.

We are not only enabled thus to distinguish the person in as powerful a manner as the Latins, but can also with the same facility point out any of the other circumstances as principals;

for if we say, with the emphasis upon the word *have*, “*I HAVE Language loved*,” it as naturally points out the time as the principal object, and makes us to look for a contrast in that peculiarity, *I HAVE*: “*I have loved indeed; my imagination has been led astray, my reason has been perverted; but, now that time has opened my eyes, I can smile at those imaginary distresses which once perplexed me*.” In the same manner we can put the emphasis upon the other word of the phrase, *loved*; “*I have loved*.” Here the passion is exhibited as the principal circumstance; and as this can never be excited without some object, we naturally wish to know the object of that passion, “*Who! what have you loved?*” are the natural questions we would put in this case. “*I have loved Eliza*.” In this manner we are, on all occasions, enabled to express, with the utmost precision, that particular idea which we would wish to excite, so as to give an energy and perspicuity to the language, which can never be attained by those languages whose verbs are conjugated by inflection; and if to this we add the inconvenience which all inflected languages are subject to, by having too small a number of tenses, so as to be compelled to make one word on many occasions supply the place of two, three, or even four, the balance is turned still more in our favour. Thus, in Latin, the same word, *AMABO*, stands for *shall* or *will love*, so that the reader is left to guess from the context which of the two meanings it was most likely the writer had in view. In the same manner *may* or *can love* are expressed by the same word, *AMEM*; as are also *might*, *could*, *would*, or *should love*, by the single word *AMAREM*, as we have already observed, so that the reader is left to guess which of these four meanings the writer intended to express; an ambiguity which occasions a perplexity very different from that clear precision which our language allows of, by not only pointing out the different words, but also by allowing us to put the emphasis upon any of them we please, which superadds energy and force to the precision it would have had without that assistance.

Upon the whole, therefore, after the most candid examination, we must conclude that the method of conjugating verbs by *inflection* is inferior to that which is performed by the help of *auxiliaries*; because it does not afford such a diversity of sounds, nor allow such variety in the arrangement of expression for the same thought, nor give so great distinction and precision in the meaning. It is, however, attended with one considerable advantage above the other method; for, as the words of which it is formed are necessarily of great length, and more sonorous than in the analogous languages, it admits of a more flowing harmony of expression; for the number of monosyllables in this last greatly checks that pompous dignity which naturally results from longer words. Whether this single advantage is sufficient to counterbalance all the other defects with which it is attended, is left to the judgment of the reader to determine. But we may remark before we quit the subject, that even this excellence is attended with some peculiar inconveniences, which shall be more particularly pointed out in the sequel.

But perhaps it might still be objected, that although the comparisons we have made above may be fair, and the conclusion just, with regard to the Latin and English languages, yet it does not appear clear, that on that account the method of conjugating verbs by *inflection* is inferior to that by *auxiliaries*; for, although it be allowed that the Latin language is defective in point of tenses, yet, if a language were formed which had a sufficient number of inflected tenses to answer every purpose; if it had, for instance, a word properly formed for every variation of each tense; one for *I love*, another for *I do love*; one for *I shall*, another for *I will love*; one for *I might*, another for *I could*, and *would*, and *should love*; and so on through all the other tenses; that this language would not be liable to the objections we have brought against the inflection of verbs; and that of course the objections we have brought are only valid against those languages which have followed that mode and executed it imperfectly. We answer, that although this would in some measure remedy the evil, yet it would not remove it entirely. For, in the first place, unless every verb, or every small number of verbs, were conjugated in one way, having the sound of the word in each tense, and division of tenses, as we may say, different from all the other conjugations, it would always occasion a sameness of sound, which would in some measure prevent that variety of sounds

Language. so proper for a language. And even if this could be effected, it would not give such a latitude to the expression as auxiliaries allow; for, although there should be two words, one for *I might*, and another for *I could* love, yet as these are single words, they cannot be varied; whereas, by auxiliaries, either of these can be varied twenty-four different ways, as has been shown above. In the last place, no single word can ever express all that variety of meaning which we can do by the help of our auxiliaries and the emphasis. *I have loved*, if expressed by any one word, could only denote at all times one distinct meaning; so that to give it the power of ours, three distinct words at least would be necessary. However, if all this were done; that is, if there were a distinct conjugation formed for every forty or fifty verbs; if each of the tenses were properly formed, and all of them different from every other tense as well as every other verb; and these all carried through each of the different persons, so as to be all different from one another; and if likewise there were a distinct word to mark each of the separate meanings which the same tense could be made to assume by means of the emphasis; and if all this infinite variety of words could be formed in a distinct manner, different from each other, and harmonious; this language would have powers greater than any that could be formed by auxiliaries, if it were possible for the human powers to acquire such a degree of knowledge as to be able to employ it with facility. But how could this be attained, since upwards of ten thousand words would be necessary to form the variations of any one verb, and a hundred times that number would not include the knowledge of the verbs alone of such a language?¹ How much, therefore, ought we to admire the simple perspicuity of our language, which enables us, by the proper application of ten or twelve seemingly trifling words, the meaning and use of which can be attained with the utmost ease, to express all that could be expressed by this unwieldy apparatus? What can equal the simplicity or the power of the one method, but the well-known powers of the twenty-four letters, the knowledge of which can be obtained with so much ease, whilst their powers know no limits? or, what can be compared to the fancied perfection of the other, but the transcript of it which the Chinese seem to have formed in their unintelligible language?

Having thus considered pretty fully the advantages and defects of each of these two methods of varying verbs, we cannot help feeling a secret wish arise in our mind, that there had been a people sagacious enough to have united the powers of the one method with those of the other; nor can we help being surprised, that among the changes which took place in the several languages of Europe after the downfall of the Roman monarchy, some of them did not accidentally stumble on the method of doing it. From many concurring circumstances, it seems probable that the greater part, if not all, of the Gothic nations that overran Italy at that time, had their verbs varied by the help of auxiliaries; and many of the modern European languages which have sprung from them, have so far borrowed from the Latin, as to have some of the tenses of their verbs inflected. Yet the English alone have in any instance combined the joint powers of the two, which could only be done by forming inflections for the different tenses in the same manner as the Latins, and at the same time retaining the original method of varying them by auxiliaries; by which means either the one or the other method could have been employed as occasion required. We have luckily two tenses formed in that way, the *present* of the indicative, and the aorist of the *past*. In almost all our verbs these can be declined either with or without auxiliaries. Thus the present, without an auxiliary, is, *I love, I write, I speak*; with an auxiliary, *I do write, I do love, I do speak*. In the same manner, the past tense, by inflection, is, *I loved, I wrote, I spoke*; by auxiliaries, *I did love, I did speak, I did write*. Every author who knows any thing of the power of the English language, knows the use which may be made of this distinction. What a pity is it that we should have stooped short so soon. How blind was it in many other nations to imitate the

defects without making a proper use of that beautiful language which is now numbered among the dead.

After the verbs, the next most considerable variation we find between the *analogous* and *transpositive* languages is in the nouns; the latter varying the different cases of these by *inflection*; whereas the former express all the different variations of them by the help of other words prefixed, called *prepositions*. Now, if we consider the advantages or disadvantages of either of these methods under the same heads as we have done the verbs, we shall find, that with regard to the first particular, viz., variety of sounds, almost the same remarks may be made as upon the verbs; for if we compare any particular noun by itself, the variety of sound appears much greater between the different cases in the *transpositive*, than between the translation of these in the *analogous* language. Thus *rex, regis, regi, regem, &c.*, are more distinct from one another in point of sound, than the translation of these, *a king, of a king, to a king, a king, &c.* But if we proceed one step further, and consider the variety which is produced in the language in general by the one or the other of these methods, the case is entirely reversed. For, as it would have been impossible to form distinct variations, different from one another, for each case of every noun, they have been obliged to reduce all their nouns into a few general classes, called *declensions*, and to give to all those included under each class the same termination in every case, which produces a like similarity of sound with what we already observed was occasioned to the verbs from the same cause; whereas, in the *analogous* languages, as there is no necessity for any constraint, there is almost as great a variety of sounds as there are of nouns. The Latins have only five different declensions; so that all the great number of words of this general order must be reduced to the very small diversity of sounds which these few classes admit of; and even the sounds of these few classes are not so much diversified as they might have been, as many of the different cases in the different declensions have exactly the same sounds, as we shall have occasion to remark more fully hereafter. We might here produce examples to show the great similarity of sounds between different nouns in the Latin language, and variety in the English, in the same way as we did of the verbs; but as every reader in the least acquainted with these two languages, can satisfy himself in this particular, without any further trouble than by marking down any number of Latin nouns, with their translations into English, we think it unnecessary to dwell longer on this particular.

But if the inflection of nouns is a disadvantage to a language in point of diversity of sounds, it is very much the reverse with regard to the variety it allows in the arranging the words of the phrase. Here, indeed, the *transpositive* language shines forth in all its glory, and the *analogous* must yield the palm without the smallest dispute. For as the *nominative case*, or that noun which is the cause of the energy expressed by the verb, is different from the *accusative*, or that noun upon which the energy expressed by the verb is exerted, these may be placed in any situation that the writer shall think proper, without occasioning the smallest confusion; whereas, in the *analogous* languages, as these two different states of the noun are expressed by the same word, they cannot be distinguished but by their position alone; so that the noun, which is the efficient cause, must always precede the verb, and that which is the passive subject must follow, which greatly cramps the harmonious flow of composition. Thus the Latins, without the smallest perplexity in the meaning, could say either *Brutum amavit Cassius*, or *Cassius amavit Brutum*, or *Brutum Cassius amavit*, or *Cassius Brutum amavit*. As the termination of the word *Cassius* always points out that it is in the *nominative case*, and therefore that he is the person from whom the energy proceeds; and in the same manner, as the termination of the word *Brutum* points out that it is in the *accusative case*, and consequently that he is the object upon whom the energy is exerted, the meaning continues still distinct and clear, notwithstanding all these several variations; whereas, in the Eng-

¹ This assertion may perhaps appear to many very much exaggerated; but if any one should think so, we only beg the favour that he will set himself to mark all the variations of tenses, mode, person, and number, which an English verb can be made to assume, varying each of these in every way that it will admit, both as to the diversity of expression and the emphasis, and he will soon be convinced that we have here said nothing more than enough.

Language. lish language, we could only say, *Cassius loved Brutus*, or, by a more forced phraseology, *Cassius Brutus loved*. Were we to reverse the case, as in the Latin, the meaning also would be reversed; for if we say *Brutus loved Cassius*, it is evident, that instead of being the person beloved, as before, *Brutus* now becomes the person from whom the energy proceeds, and *Cassius* becomes the object beloved. In this respect, therefore, the analogous languages are greatly inferior to the transpositive; and, indeed, it is from this single circumstance alone that they derive their chief excellence.

But although it thus appears evident that any language which has a particular variation of its nouns to distinguish the *accusative* from the *nominative case*, has an advantage over those languages which have none; yet it does not appear that any other of their *cases* adds to the variety, but rather the reverse; for in Latin we can only say *Amor Dei*; in English the same phrase may be rendered either *the love of God*, or *God the love*, or, by a more forced arrangement, *God the love of*. And as these oblique cases, as the Latins called them, except the *accusative*, are clearly distinguished from one another and from the *nominative*, by the preposition which accompanies them, we are not confined to any particular arrangement with regard to these, as with the *accusative*, but may place them in what order we please, as in Milton's elegant invocation at the beginning of *Paradise Lost* :—

“Of man's first disobedience, and the fruit
Of that forbidden tree, whose mortal taste
Brought death into the world, and all our woe,
With loss of Eden, till one greater man
Restore us, and regain the blissful seat,
Sing, heavenly muse.”

In this sentence the transposition is almost as great as the Latin language would admit of, and the meaning as distinct as if Milton had begun with the plain language of prose.

Before we leave this head, we may remark, that the little attention which seems to have been paid to this peculiar advantage, derived from the use of an *accusative case* different from the *nominative*, is somewhat surprising. The Latins, who had more occasion to attend to this with care than any other nation, and even the Greeks themselves have in many cases overlooked it, as is evident from the various instances we meet with in their languages where this is not distinguished. For all nouns of the neuter gender, both in Greek and Latin, have in every declension their *nominative* and *accusative singular* alike. Nor in the plural of such nouns is there any distinction between these two cases; and in Latin all nouns whatever of the third, fourth, and fifth declensions, of which the number is very considerable, have their *nominative* and *accusative plural* alike. So that their language reaps no advantage in this respect from almost one-half of their nouns. Nor have any of the modern languages in Europe, however much they may have borrowed from the ancient languages in other respects, attempted to copy from them in this particular; from which perhaps more advantage would have been gained, than from copying all the other supposed excellencies of their language. But to return to our object.

It remains that we consider whether the inflection of nouns gives any advantage over the method of defining them by prepositions, in point of distinctness and precision of meaning? But in this respect, too, the analogous languages must come off victorious. Indeed, this is the particular in which their greatest excellence consists; nor was it, we believe, ever disputed but that, in point of accuracy and precision, this method must excel all others, however it may be defective in other respects. We observed under this head, when speaking of verbs, that it might perhaps be possible to form a language by inflection which should be capable of as great accuracy as in the more simple order of auxiliaries; but this would have been such an infinite labour that it was not to be expected that ever human powers would have been able to accomplish it. More easy would it have been to have formed the several inflections of the nouns so different from one another as to have rendered it impossible ever to mistake the meaning. Yet even this has not been attempted. And as we find that those languages, which have adopted the method of inflecting their verbs, are more imperfect in point of precision than the other, so the same may be said of inflecting the nouns; for,

not to mention the energy which the analogous languages acquire by putting the accent upon the noun, or its preposition, when in an oblique case, according as the subject may require,—to express which variation of meaning no particular variety of words have been invented in any inflected language,—they are not even complete in other respects. The Latin, in particular, is in many cases defective, the same termination being employed in many instances for different cases of the same noun. Thus the *genitive* and *dative singular*, and *nominative* and *vocative plural*, of the first declension, are all exactly alike, and can only be distinguished from one another by the formation of the sentence; as are also the *nominative*, *vocative*, and *ablative singular*, and the *dative* and *ablative plural*. In the second, the *genitive singular* and *nominative* and *vocative plural* are the same, as are also the *dative* and *ablative singular*, and *dative* and *ablative plural*, except those in *um*, whose *nominative*, *accusative*, and *vocative singular*, and *nominative*, *accusative*, and *vocative plural*, are alike. The other three declensions agree in as many of their cases as these do, which evidently tends to perplex the meaning, unless the hearer is particularly attentive to, and well acquainted with, the particular construction of the other parts of the sentence; all of which is totally removed, and the clearest certainty exhibited at once, by the help of prepositions in the analogous languages.

It will hardly be necessary to enter into such a minute examination of the advantages or disadvantages attending the variation of *adjectives*, as it will appear evident, from what has been already said, that the endowing them with terminations similar to, and corresponding with, *substantives*, must tend still more to increase the similarity of sounds in any language, than any of those particulars we have already taken notice of; and were it not for the liberty which they have, in transpositive languages, of separating the adjective from the substantive, this must have occasioned such a jingle of similar sounds as could not fail to have been most disgusting to the ear; but as it would have been impossible in many cases, in those languages where the verbs and nouns are inflected, to have pronounced the words which ought to have followed each other, unless their adjectives could have been separated from the substantives, therefore, to remedy this inconvenience, they were forced to devise this unnatural method of inflecting them also; by which means it is easy to recognise to what substantive any adjective has a reference, in whatever part of the sentence it may be placed. In these languages, therefore, this inflection, both as to gender, number, and case, becomes absolutely necessary; and, by the diversity which it admitted in the arranging the words of the several phrases, might counterbalance the jingle of similar sounds which it introduced into the language.

Having thus examined the most striking particulars in which the transpositive and analogous languages differ, and endeavoured to show the general tendency of every one of the particulars separately, it would not be fair to dismiss the subject without considering each of these as a whole, and pointing out their general tendency in that light: for, we all know, that it often happens in human inventions, that every part which composes a whole, taken separately, may appear extremely fine; and yet, when all these parts are put together, they may not agree, but produce a jarring and confusion very different from what we might have expected. We, therefore, imagine that a few remarks upon the genius of each of these two distinct *idioms* of language, considered as a whole, will not be deemed useless.

Although all languages agree in this respect, that they are the means of conveying the ideas of one man to another, yet as there is an infinite variety of ways in which we might wish to convey these ideas, sometimes by the easy and familiar mode of conversation, and at other times by more solemn addresses to the understanding, by pompous declamation, &c., it may so happen that the genius of one language may be more properly adapted to the one of these than the other, while another language may excel in the opposite particular. This is exactly the case in the two general *idioms* of which we now treat. Every particular in a transpositive language is peculiarly calculated for that solemn dignity which is necessary for pompous orations. Long-sounding words, formed by the inflection of the different parts of speech; flowing periods, in which the

Language. attention is kept awake by the harmony of the sounds, and in expectation of that word which is to unravel the whole ; if composed by a skilful artist, are admirably suited to that solemn dignity and awful grace which constitutes the essence of a public harangue. On the contrary, in private conversation, where the mind wishes to unbend itself with ease, these become so many clogs which encumber and perplex. At these moments we wish to transfuse our thoughts with ease and facility, we are tired with every unnecessary syllable, and wish to be freed from the trouble of attention as much as may be. Like our state robes, we would wish to lay aside our pompous language, and enjoy ourselves at home with freedom and ease. Here the solemnity and windings of the *transpositive* language are burdensome, while the facility with which a sentiment can be expressed in the *analogous* language is the thing that we wish to acquire. Accordingly, in Terence and Plautus, where the beauties of dialogue are most charmingly displayed, transposition is sparingly used. In this humble, though most engaging sphere, the analogous language moves unrivalled ; in this it wishes to indulge, and never tires. But it in vain attempts to rival the *transpositive* in dignity and pomp : the number of monosyllables interrupts the flow of harmony ; and, although they may give a greater variety of sounds, yet they do not naturally possess that dignified gravity which suits the other language. This, then, must be considered as the striking particular in the genius of these two different *idioms* which marks their characters.

If we consider the effects which these two different characters of language must naturally produce upon the people who employ them, we will soon perceive that the genius of the *analogous* language is much more favourable for the most engaging purposes of life—the civilizing the human mind by mutual intercourse of thought—*than the transpositive*. For as it is chiefly by the use of speech that man is raised above the brute creation—as it is by this means he improves every faculty of his mind, and, to the observations which he may himself have made, has the additional advantage of the experience of those with whom he may converse, as well as the knowledge which the human race have acquired by the accumulated experience of all preceding ages—as it is by the enlivening glow of conversation that kindred souls catch fire from one another, that thought produces thought, and each improves upon the other, till they soar beyond the bounds which human reason, if left alone, could ever have aspired to—we must surely consider that language as the most beneficial to society which most effectually removes those bars that obstruct its progress. Now, the genius of the *analogous* languages is so easy, so simple and plain, as to be within the reach of every one who is born in the kingdom where it is used to speak it with facility ; even the rudest among the vulgar can hardly fall into any considerable grammatical errors : whereas, in the *transpositive* languages, so many rules are necessary to be attended to, and so much variation is produced in the meaning, by the slightest variations in the sound, that it requires a study far above the reach of the illiterate mechanic ever to attain. So that, how perfect soever the language may be when spoken with purity, the bulk of the nation must ever labour under the inconvenience of rudeness and inaccuracy of speech, and all the evils which this naturally produces. Accordingly, we find that in Rome a man, even in the highest rank, received as much honour, and was as much distinguished among his equals, for being able to converse with ease, as a modern author would be for writing in an easy and elegant style ; and Cæsar, among his contemporaries, was as much esteemed for his superiority in speaking the language in ordinary conversation with ease and elegance, as for his powers of oratory, his skill in arms, or his excellence in literary composition. It is needless to point out the many inconveniences which this must unavoidably produce in a state. It is sufficient to observe, that it naturally tends to introduce a vast distinction between the orders of men—to set an impenetrable barrier between those born in a high and those born in a low station—to keep the latter in ignorance and barbarity, while it elevates the former to such a height as must subject the other to be easily led by every popular demagogue. How far the history of the nations who have followed this *idiom* of language confirms this observation, every one is left to judge for himself.

[The first stage of language exhibits single words, chiefly Language. nouns or verbs, in a short form, and with a *minimum* amount of inflection, some subordinate to the others, *but still separate words*. The Chinese is usually considered to be the type of language in this state.]

In the second, the subordinate words coalesce with the main ones, but not so as to wholly conceal their originally separate existence. Languages in this state are called *agglutinate*. This is the state in which most of the languages of the world exist. The Mantshu and Mongol are the usual examples of this condition. Most other tongues, however, would serve as well.

The coalition of the subordinate with the main word having become so perfect as for the former to look like a part of the latter rather than a word originally separate, the combination becomes *amalgamate* instead of *agglutinate*, and the language *inflectional*. The Greek and Latin are the types of this form.

Inflections fall off, and get displaced by separate words, these words being of a peculiar kind—propositions with substantives, auxiliaries with verbs. The English is in this stage, and, doubtless, it is destined to further changes.

These, however, will not be in a cycle. It is only in appearance that the fourth stage is in the same predicament as the first. It is only in the comparative absence of inflections, and the separate existence of the subordinate parts of sentences, that they agree. The subordinate words themselves differ.

An English auxiliary, or proposition, in its more typical form, is meaningless when taken by itself. In *I have ridden a horse*, the word *have* originally meant, *I possess a horse as a ridden thing* ; where, however, is the idea of possession in *I have been*, a sentence exhibiting language in the most abstract or supra-sensible form in which it has ever existed ?

In the difference of character between the subordinate words of sentences, we have a means of ascertaining whether languages in the same non-inflectional state have lost their inflection, or have yet to develop them. The question, however, is not asked so often as it ought to be.

In the actual field of language the lines of demarcation are less definitely marked than in the preceding sketch. The phenomena of *growth*, however, are, upon the whole, what it suggests.

That languages like the English, French, &c., are more advanced, grown, or developed, than the classical tongues, is certain, whatever may be the interpretation of the fact in a question as to the relative values of the different stages.—R. G. L.]

II.—AFFINITIES OF LANGUAGE.

The study of the affinities of various languages is so far one of the most important of all branches of human knowledge, as it affords, when properly applied, an unerring test of the truth or falsehood of historical evidence, without which it would sometimes be impossible to unravel the mysteries of contradictory testimonies, respecting the relations of the different races of mankind. We have, for example, no traditional evidence in support of any connection between the ancient Egyptians and the Indians ; whilst, on the other hand, a number of persons who came with the English army from the East Indies into Egypt, were so strongly impressed with the resemblance of the Egyptian and Indian temples, which appeared even to excite the religious feelings of many of the natives who were amongst the troops employed, that a very general inclination has arisen from these circumstances to consider the Egyptian mythology as merely a branch of the Indian. But if the Egyptian people had really been of Indian origin—that is, if the Egyptians and Indians had really been one people, at any later period than that at which the whole of the Indian and European races were separated from their common stock—the languages of India and of Egypt could not but have exhibited some features of resemblance, which would have preserved the traces of the connection ; whilst, in fact, there is much less similarity between the Egyptian and the Indian, than between the Indian and the Greek, or the English and the Persian ; so that etymology may here be adduced as confirming the evidence, or as justifying the silence, of history ; and the resemblance of the mythological representations must be considered as in great measure accidental.

Language. [Similarity of language is strong *prima facie* evidence in favour of a common origin; but it is nothing more. The strongest instances of a mother-tongue having become forgotten or unlearned, and a new language adopted in its stead, are to be found amongst the negroes of the New World. In St Domingo, the languages are French and Spanish; in the United States, English; and in South America, Dutch, Spanish, and Portuguese. Here, however, the conditions were peculiar. The native language was no longer connected with the soil to which it was indigenous, but transplanted to a new area. Neither was it any single homogeneous form of speech that was obliterated, but, on the contrary, a multitude of mutually unintelligible tongues, which, under any circumstances, would have ended in the establishment of a *Lingua Franca*.

With the negro languages of the New World we have the *maximum* amount of change in speech with a *minimum* in the way of intermixture of blood. With the native American tribes, the phenomena of change are somewhat different. As a general rule, the number of individuals who speak one and the same language is remarkably small; every now and then, however, in contact with these small patches of speech, is to be found some language spread over a considerable area, and spoken by several tribes. These the missionaries have converted into *Lingua Francas*; it being a matter of observation that an American Indian learns an American language, no matter how unlike his own, easier than one from Europe. Many of the minor languages of the South American republics and Brazil have thus been replaced by the Guarani.

In each of the previous cases, there is the actual replacement of one language by another. In the *Lingua Franca* of Europe this is not always the case. In the Levant, the Italian (the *Lingua Franca*, or its basis) is spoken by numerous Arabs, Greeks, &c. The native Arabic, however, and the native Greek, co-exist by the side of it. There is no extinction as yet. Nevertheless, the tendencies towards it have set, inasmuch as where two languages have to be learned, the less useful is the weakest, and has a chance of going to the wall.

Sometimes with two languages thus brought in contact with each other, we have the phenomenon of intermixture, rather than obliteration—an intermediate tongue being formed out of the fusion of two. *A priori*, it seems likely that such should be the case often. In reality, however, the development of such a language as (say) C, out of languages A and B, is very rare indeed. The ordinary phenomenon is A with a certain amount of B, or B with a certain amount of A—the original character of the fundamental language being preserved. The English (for instance), for all its Latin elements, is German; the French, for all its German elements, Latin.

This suggests, that in language we have every degree of change, from simple intermixture to absolute obliteration and replacement. It also suggests, that similarity of language is a matter of degree. There may be absolutely community of tongue, or there may be an admixture of say *one per cent.* of foreign terms. Language is one of those signs of community of origin which is slow to be abolished—slower than most others—slower, perhaps (on the whole), than any other; nevertheless, it is only a sign, and a sign capable of obliteration. Its relative permanence, when compared with other *criteria*, is a matter upon which there is a wide discrepancy of opinion; the facts upon which our hypotheses must rest being by no means easily ascertained. It is only certain that the questions involved in it are far too complicated to be disposed of by the application of any general rule. As new ideas are introduced, language changes. As new physical influences are brought into action, the anatomical conformation of the human body becomes modified. That these latter forces have some influence is universally admitted; though many competent authorities put a close limit on its extent. It is clear, however, that, within certain limits, both language and physical conformation may change.

They may change at different rates—*i.e.*, in a given period (say ten generations), the speech may be considerably modified, whilst the anatomy of the speakers remains the same. And, *vice versa*, the physiognomies may alter, whilst language remains fixed. Every comparison of the difference of rate between such changes should be made on the merits of the particular question under notice, no general rule being sufficient.

Next comes the question of *limit*. Here we may safely say,

that the range of change in language is wider than that of Language. which physical form is susceptible. It is, clearly, easier for a negro to be converted into a Frenchman in the matter of language, than in that of colour. Extreme forms of language may more easily be converted into each other, than extreme forms of physical conformation; and this is all that can safely be said. It is by no means certain that a population of negroes, transplanted from a low alluvial swamp to an elevated mountain range, would not retain their language without alteration, than they would their physical form—*within certain limits*.

The contact of two languages has a greater tendency to effect the obliteration of one of them than the development of a *tertium quid* out of their fusion.

The contact of different stocks in the way of physical union has a greater tendency to effect the intermixture of blood than the obliteration of one of the constituent elements.

From this it follows, that languages are much more *either one thing or another* than stocks, races, or families. The language of Radnorshire and Cornwall is much more English (as opposed to Welsh) than the blood or pedigree of its speakers is English; indeed, as a general rule, the blood of a given population is more mixed than its language. This is because, whilst A and B, in the way of stock, blood, or pedigree, will give C (a true *tertium quid*, or a near approach to it), A and B, in the way of language, will only give themselves,—*i.e.*, they will give no true *tertium quid*, nor any very close approach to it. These, however, are matters that belong to the question of *man* in general rather than to language. Language (as an instrument of criticism in ethnology) is the most permanent of the *criteria* of human relationship derivable from our *moral* constitution, and, in some cases, equally permanent with physical form, though, in the case of extreme changes, less so.

The particular illustration of the original text to which this notice is a comment, drawn from the languages of India and Egypt, is exceptionable. The languages of India are *two* in number. Of these it is only one, the Sanscrit, that is more Persian, &c., than Egyptian. Of the other, the Tamul, &c., no such statement can be made. It is, probably, more Egyptian than Persian—certainly more Egyptian than Greek or English.—R. G. L.]

It is, however, only with regard to the languages of the ancient world that we can feel much interest in such an investigation. The American dialects might afford equally extensive subjects of speculation in a metaphysical and critical point of view; but the concerns of barbarians, unconnected and remote from all contact with literature or civilization, and destitute of all historical records, will scarcely be thought to require any great portion of attention from a philosophical inquirer; and there is ample scope for the employment of all our faculties in the analysis and comparison of the various languages of Europe, Asia, and Africa. If, indeed, an extraordinary exertion of enterprise and industry, which can be expected from a few distinguished individuals only in the course of as many centuries, should make known relations, such as Alexander von Humboldt has appeared to discover, between the American and Asiatic nations, a new field would be opened for the gratification of our curiosity; but it can scarcely be expected that these points of resemblance can be sufficiently numerous to afford any thing like demonstrative evidence, until the whole subject has been much more deeply and repeatedly discussed. In the mean time, a very brief enumeration of the names of the American languages is all that can be required, on an occasion like the present; except the insulated though interesting remark, that the countries separated by Behring's Straits exhibit, as might indeed be expected, strong resemblances in some of their languages.

[It is in the *runder* languages that the important phenomena of development and growth—the laws of language—are best studied. The following extracts are from an opuscle of the writer on the subject:—

"A little consideration will show, that that difference between the study of a given subject in its general and abstract, and the study of one in its applied or concrete form, which finds place in so many departments of human knowledge, finds place in respect to language and languages. It finds place in the subject before us as truly as it does in the science of the laws of life—physiology or biology. Just as there is therein a certain series of laws relating to life and organization, which

Language. would command our attention, if the whole animal and vegetable world consisted of but a single species, so the study of speech would find space in a well-devised system of education, even if the tongues of the whole wide world were reduced to a single language, and that language to a single dialect. This is because the science of life is one thing, the science of the forms under which the phenomena of life are manifested, another. And just as physiology, or biology, is, more or less, anterior to, and independent of, such departments of study as botany and zoology, so, in the subject under notice, there is the double division of the study of *language* in respect to structure and development, and the study of *languages* as instances of the variety of form in which the phenomenon of human speech exhibits, or has exhibited, itself. Thus—

“When (as I believe once to have been the case) there was but a single language on the face of the earth, the former of these divisions had its subject-matter. And—

“When (as is by no means improbable) one paramount and exclusive tongue, developed, at first, rapidly and at the expense of the smaller languages of the world, and, subsequently, slowly and at that of the more widely-diffused ones, shall have replaced the still numerous tongues of the nineteenth century, and when all the dialects of the world shall be merged into one universal language, the same subject-matter for the study of the structure of language, its growth and changes, will still exist.

“So that the study of language is one thing, the study of languages another.

“One main distinction between the study of language and the study of languages lies in the fact of the value of the former being *constant*, that of the latter *fluctuating*. The relative importance of any two languages, as objects of special attention, scarcely ever remains steady. The value, for instance, of the German—to look amongst the cotemporary forms of speech—has notably risen within the present century. And why? Because the literature in which it is embodied has improved. Because the scientific knowledge which, to all who want the key, is (so to say) locked up in it, has increased some hundred per cent.

“But it may go down again. Suppose, for instance, that new writers of pre-eminent merit ennoble some of the minor languages of Europe—the Danish, Swedish, Dutch, &c. Such a fact would divide the attention of *savans*—attention which can only be bestowed upon some second, at the expense of some first, object. In such a case, the extent to which the German language got studied would be affected much in the same way as that of the French was by the development of the literature of Germany.

“Or the area over which a language is spoken may increase, as it may also diminish.

“Or the number of individuals that speak it may multiply—the area being the same.

“Or the special application of the language, whether for the purposes of commerce, literature, science, or politics, may become changed. In this way, as well as in others, the English is becoming, day by day, more important.

“There are other influences.

“High as is the value of the great classical languages of Greece and Rome, we can easily conceive how that value might be enhanced. Let a manuscript containing the works of some of the lost, or imperfectly preserved, writers of antiquity be discovered. Let, for instance, Gibbon's *desiderata*—the lost *Decads of Livy*, the *Orations of Hyperides*, or the *Dramas of Menander*—be made good; the per-centage of classical scholars would increase, little or much.

“Some years back it was announced that the *Armenian* language contained translations, made during the earlier centuries of our era, of certain classical and ecclesiastical writings, of which the originals had been lost—lost in the interval. This did not exactly make the *Armenian*, with its alphabet of six-and-thirty letters, a popular tongue; but it made it, by a fraction, more popular than it was in the days of Whiston and La Croze, when those two alone, of all the learned men of Europe, could read it.

“Translations tell in another way. Whatever is worth reading in the Danish and Swedish is forthwith translated into German. *E.g.*, Professor Retzius of Stockholm wrote a good Manual of Anatomy. He had the satisfaction of seeing it translated into German. He had the further satisfaction of

hearing that the translation ran through five editions in less time than the original did through one.

“Now, if the Germans were to leave off translating, the value of the language in which Professor Retzius wrote his Anatomy would rise.

“Upon the whole, the French is, perhaps, the most important language of the nineteenth century; yet it is only where we take into consideration the whole of its elements of value.

“To certain special *savans*, the German is worth more; to the artist, the Italian; to the American, the Spanish. It fell, too, in value, when nations like our own insisted upon the use of their native tongues in diplomacy. It fell in value because it became less indispensable; and another cause, now in operation, affects the same element of indispensability. The French are beginning to learn the languages of other nations. Their own literature will certainly be none the worse for their so doing. But it by no means follows that that literature will be any the more studied; on the contrary, Frenchmen will learn English more, and, *pro tanto*, Englishmen learn French less.

* * * * *
“What is the import of such sounds as that of the letter *s* in the word father-*s*? It is the sign of the plural number.

“Such is the question—such the answer. But is the answer a real one? Is it an answer at all? How come such things as plural numbers, and signs of plural numbers, into language? How the particular plural before us came into being, I cannot say; but I can show how *some* plurals have. Let us explain the following—

Ngi = I.	Ngi-n-de = We.
Ngo = Thou.	Ngo-n-da = Ye.
Ngu = He.	Nge-n-da = They.
	Da = With.

The *da* (or *de*) in the second column is the sign of the plural number in a language which shall at present be nameless. It is also the preposition *with*. Now *with* denotes association; association, *plurality*. Hence

Ngi - n - de = I	+	= We.
Ngo - n - da = Thou	+	= Ye.
Nge - n - da = He	+	= They.

This is just as if the Latins, instead of *nos* and *vos*, said *me-cum* and *te-cum*.

“Such is the history of one mode of expressing the idea of plurality; we can scarcely say of a *plural number*. The words *plural number* suggest the idea of a single word, like *fathers*, where the *s* is inseparably connected with the root, at least so far inseparably connected as to have no independent existence of its own. *Ngi-n-de*, however, is no single word at all, but a pair of words in juxtaposition, each with a separate existence of its own. But what if this juxtaposition grow into *amalgamation*? What if the form in *da* change? What if it become *t* or *z*, or *th*, or *s*? What if, meanwhile, the separate preposition *da* change in form also; in form or meaning, or perhaps in both? In such a case a true plural form is evolved, the history of its evolution being a mystery.

“So much for one of the inflections of a *noun*. The remaining words illustrate one of a *verb*.

“Hundreds of grammarians have suggested that the signs of the *persons* in the verb might be neither more nor less than the personal pronouns *appended*, in the first instance, to the verb, but afterwards amalgamated or incorporated with it. If so, the *-m* in *inquam* is the *m* in *me*, &c. The late Mr Garnett, a comparative philologist whose reputation is far below his merits, saw that this was not exactly the case. He observed that the appended pronoun was not so much *Personal Possessive*; that the analysis of a word like *inquam* was not so much, *say + I*, as *saying + my*; in short, that the verb was a noun, and the pronoun either an adjective (like *meus*) or an oblique case (like *mei*), agreeing with or governed by it.

“It is *certainly* so in some cases. In a language which, at present, shall be nameless, instead of saying *my apple*, *thy apple*, they say what is equivalent to *apple-m*, *apple-th*, &c. —*i.e.*, they append the possessive pronoun to the substantive, and by modifying its form, partially incorporate or amalgamate it. They do more than this. They do precisely the same with the verbs in their *personal* as they do with the nouns in their

Language. *possessive* relations. Hence, *olvas-om*, &c., is less *I read* than *my-reading*; less *read + I*, than *reading + my*.

i.
Olvas—om = *I read*.
od = *Thou readest*.
uk = *We read*.
atok = *Ye read*.

ii.
Alma—m = *My apple*.
d = *Thy apple*.
nk = *Our apple*.
tok = *Your apple*.

"I submit, that facts of this kind are of some value, great or small. But the facts themselves are not all. How were they got at? They were got at by dealing with the phenomena of language as we found them, by an induction of no ordinary width and compass; and many forms of speech had to be investigated before the facts came out in their best and most satisfactory form.

"The illustration of the verb (*olvasom*, and *almam*, &c.) is from the Hungarian; that of the plural number (*nginde*, &c.), from the Tumali—the Tumali being a language no nearer than the negro districts to the South of Cordovan, between Sennaar and Darfur, and (as such) not exactly in the highway of literature and philology." (*Lecture on the Importance of the Study of Language as a Branch of Education for all Classes*, by Robert Gordon Latham, M.D., F.R.S.)

Of language in general we do not here intend to treat, but merely of languages as they are distinct from each other. It is not, however, very easy to say what the definition ought to be that should constitute a separate language; but it seems most natural to call those languages distinct, of which the one cannot be understood by common persons in the habit of speaking the other, so that an interpreter would be required for communication between persons of the respective nations. Still, however, it may remain doubtful whether the Danes and the Swedes could not, in general, understand each other tolerably well, and whether the Scottish Highlanders and the Irish would be able to drink their whisky together without an interpreter; nor is it possible to say, if the twenty ways of pronouncing the sounds belonging to the Chinese characters, ought or ought not to be considered as so many languages or dialects, though they would render all oral intercourse between the persons so speaking the language actually impracticable. But, whether we call such variations different languages, or different dialects, or merely different pronunciations of the same dialect, it is obvious that they ought all to be noticed in a complete history of languages; and, at the same time, that the languages so nearly allied must stand next to each other in a symmetrical order; the perfection of which would be, to place those languages nearest together in which the number of coincidences in the signification of words throughout the language are the most numerous.

It has sometimes been imagined, that all languages in existence present something like a trace of having been deduced from a common origin; and it would be difficult to confute this opinion by very positive evidence, unless every separate language had been very completely analysed and examined by a person well acquainted with a variety of other languages, with which it might be compared. But, without such an examination, the opinion must remain conjectural only, and no more admissible as demonstrated, than the opinions of some empirics, that there is only one disease, and that the only remedy for it is brandy. In an essay on probabilities, lately published in the *Philosophical Transactions*, Dr Young has remarked, that "nothing whatever could be inferred, with respect to the relation of two languages, from the coincidence of the sense of any single word in both of them," that is, supposing the same simple and limited combinations of sounds to occur in both, but to be applied accidentally to the same number of objects, without any common links of connection; "and that the odds would only be three to one against the agreement of two words, but if three words appeared to be identical, it would be more than ten to one that they must be derived, in both cases, from some parent language, or introduced in some other manner," from a common source; whilst "six words would

give near 1700 chances to one, and eight near 100,000; so Language. that, in these last cases, the evidence would be little short of absolute certainty."

[Few applications of mathematical reasoning to questions beyond its usual field, have commanded more attention than this calculation of Dr Young's, under whose name it is quoted in most works that support the doctrine of the fundamental unity of languages. Its scientific appearance has, doubtless, recommended it. It is exceptionable, however, on the score of its only meeting one out of the several causes of similarity of meaning accompanied with similarity of form in different languages. It only deals with the coincidences referable to chance or accident; of these, however, no advanced philologue takes any account either way; indeed, it is probable that an advocate of the unity of language might allow his opponent some dozen or scores of similar words in different languages, without either drawing any inference in favour of his own views himself, or expecting from his adversary any anticipation of any argument whatever founded upon them. The simple question of chance in language has ceased to be one of any importance. The really important question is one of the kind to which the chapter in Mill's *Logic*, on what the author calls the Collocation of Causes, has given prominence. Here a variety of causes may end in the same effect. Nowhere is this commoner than in language. Let two sounds have a tendency to change into a third—say *m* and *b* into *v*, and the combination *van* may come out of *ban* and *man* equally. The field of language is full of instances of this kind. Then there are the words that resemble one another, independent of imitation, either from being *onomatopæic*, or imitative of certain sounds, or organically connected, *i.e.*, referable to a tendency to express certain ideas by certain combinations. Certain ideas come earlier than others; so does the capability of pronouncing certain sounds. The former will naturally be represented by the latter. The sound of *r*, which comes late, is not likely to enter into the child's name of his *papa* or *mama*—ideas expressed, half the world over, by the same sounds. In the investigation of the laws by which the articulate sounds are distributed over the different languages of the world little has been done. In many cases, however, the sounds (*r*, *th*, &c.) that children learn last, are those that the ruder languages most want.—R. G. L.]

The author of the article in the *Quarterly Review*, on Adelung's *Mithridates*, observes, that, setting out from the establishment of a certain number of separate languages as species, "we may proceed to comprehend, in the description of one family, such as have more coincidences with each other than diversities, and to refer to the same class such families as exhibit any coincidences at all that are not fortuitous, imitative," that is, from *onomatopæia*, "or adoptive. In order, however, to avoid too great a number of classes, which would arise from an inadequate comparison of languages imperfectly known, it may be proper, in some cases, to adopt a geographical distinction, as sufficient to define the limits of a class, or to assist in its subdivision into orders. We are thus obliged to employ an arrangement of a mixed nature;" and, in fact, the tests of affinity here proposed depend so much on the progress of our knowledge in the study of each language, that the results must unavoidably be liable to great uncertainty and fluctuation, of that we can reasonably expect nothing more than an approximation to an arrangement completely methodical.

"If," continues the reviewer, "the resemblance or identity of a single word, in two languages, supposed to be exempt from the effects of all later intercourse, were to be esteemed a sufficient proof of their having been derived from a common stock, it would follow, that more than half the languages of the universe would exhibit traces of such connection, in whatever order we might pursue the comparison. Thus we find in a very great number, and perhaps in a majority of known languages, that the sound of the vowel *a*, with a labial consonant, is employed for the name of *Father*; and if this be supposed to be something like an *onomatopæia*, or an application of the first sounds which an infant naturally utters, the same reason cannot possibly be assigned for the still more general occurrence of the combination *nm* in the term *name*, which is by no means likely to have originated from any natural association of this kind. But neither these points of resemblance,

Language. nor any other that can be assigned, are absolutely universal; for, besides the numberless varieties referrible more or less immediately to *Abba, Father*, we have at least twenty different and independent terms for the same relation in the old world; "*Tia, Issa, Plar, Hair, Rama, Diam, Bina, Kettem, Assainalagi, Medua, Thewes, Sink, Iot, Anathien, Messee, Indaa, Nu, Nam, Monung, Dengabey, Ray, Tikkob, and Oa*; and about as many for *Name*, besides those languages in which the version of an abstract term of this kind is less likely to have been ascertained; *Ming, Tren, Diant, Sheu, Hessa, Shem, Tsarship, Ad, Nipta, Lum, Sacheli, Assia, Wasta, Ngala, Taira, Sunna, Ran, Hhili, Ding, Dbai, and Anghara*. "At the same time, therefore, that we venerate the traces of our common descent from a single pair, wherever they are still perceptible, we must not expect to find them in all existing languages without exception; and an *Etymological Universale*, considered as intended to establish such a perfect community of derivation, can only be regarded as a visionary undertaking. Nor must we neglect to unite, in some common arrangement of classification, those languages which have the words here specified, or any other radical words, in common, as incomparably more related to each other than the Chinese to the Cantabrian, or the Irish to the Hottentot.

"The gradations by which a language is likely to vary in a given time, seem to be in some measure dependent on the degree of cultivation of the language, and of the civilization of the people employing it. From Homer to the Byzantine historians, the Greek language remained essentially the same for 2000 years; the German has varied but little in 1500; and even the English, notwithstanding its mixture with French and Latin, has altered but three radical words out of the fifty-four which constitute the Lord's Prayer, in the same period. On the other hand, a few barbarians in the neighbourhood of Mount Caucasus and of the Caspian Sea, of modern origin, and ignorant of the art of writing, are divided into more nations speaking peculiar languages, radically different from each other, than the whole of civilized Europe. In such cases, little light can be thrown upon history by etymological researches; while, with regard to more cultivated nations, we obtain, from the examination of their languages, historical evidence of such a nature as it is scarcely possible for either accident or design to have falsified."

[The study of the rate at which languages change must begin with the history of those tongues which we know in more stages than one. These are few in number; being only those which are cultivated and written. In the fact of their being known in one form only (combined with the absence of a literature) lies the true reason for comparative unimportance of the ruder languages. As *languages*—i.e., as *data* for the natural history of speech—they are valuable, as they are as instruments of ethnological criticism.

Amongst the languages known to us in more stages than one, the classical languages are the chief; next to these the Hebrew, Sanskrit, Arabic, Old Slavonic, Anglo-Saxon, &c. Up to the present time they have told us, over and above the fact, that languages change at different rates, the more important one, that they change after the same fashion or upon the same principle. The Romaic differs from the ancient Greek; the Italian, &c., from the Latin; the English from the Anglo-Saxon; the Danish from the Icelandic; all in the same way—i.e., in the use of prepositions and auxiliary verbs instead of cases and moods and tenses.

This means that certain parts have a tendency to change in a definite manner. Further researches will show that they generally change in the same order, e.g., the sign of a dative case will go before that of a genitive, &c.

Hence, there is not only a question of *parts changed*, but also that of the *order* and *rate* of change; and, lastly, that of the *forces* that regulate this rate. They are somewhat different from those indicated in the text, the influence of writing and cultivation being less than is usually imagined. What they are in detail, however, has yet to be investigated.

The best exhibition of the transition of a language from one stage to another, is to be found in Petersen's History of the break-up of the Icelandic, or old Scandinavian language, into the modern tongues of Denmark, Norway, and Sweden. His facts appertaining to rate are interesting. The Danish is generally about a century in advance of the Swedish—i.e., the

Swedish of A.D. 1300, or A.D. 1800, is as archaic as the Danish Language of A.D. 1200, or A.D. 1700; the Danish of 1600 being, there or thereabouts, of the form of the Swedish of 1700.

So much for the regularity of relation between these two. Turn from them to the Norwegian. Up to the time of the Reformation it hardly changed at all; afterwards it changes in about one century as much as the other two tongues had in four.—R. G. L.]

According to the supposition of Professor Adelung, it seems not improbable that Thibet, on the E. of Cashmere, may "have been the habitation of Adam immediately after his fall, and the country occupied by the descendants of Cain. In Thibet, and in the countries immediately beyond it, the languages of at least a hundred and fifty millions of people are still principally *monosyllabic*; and from this peculiarity, as well as from the singular simplicity of their structure, they are supposed to constitute the most ancient class of existing languages, though it must be confessed that much of Adelung's reasoning on this subject is extremely inconclusive." Mr Townsend remarks very judiciously, that one of the canons of Rudbeck is by no means admissible. He states, that a language which has numerous monosyllabic expressions is a parent language. The English has more than 3700 monosyllabic expressions, and the Chinese has none but such; yet neither of them is, for that reason, to be considered as a parent language. Certain it is, that all languages, by abbreviations, have a tendency to become monosyllabic, and therefore a language which abounds in monosyllables is ancient, and these commonly are the most antiquated parts of every language. New compounds are incessantly created. These are abbreviated, and in process of time become monosyllabic. In deriving, therefore, a word in one language from its correspondent expression in some other language, we must ever bear in mind, that, unless in the formation of new compounds, the least abbreviated is commonly the parent, and the most abbreviated its offspring. Would it be possible for any one to persuade us that *Colaphus* was derived from *Cuff*, or *Blaspheme* from *Blame*? "A similar instance," says the reviewer, "might be found in *Trachelos* and *Hals* of the Greeks and Germans; for certainly *Hals* is more like *Trachelos* than like *Collum*."

[Monosyllabism is one thing: the want of inflection is another. Wherever there is a want of inflection, there is the word in its simpler form—i.e., a root *minus* any adjuncts. Without this absence of adjuncts, there is but little chance of words being monosyllabic. It may occur, however, and yet leave the roots dissyllabic or even polysyllabic—since there is no necessity for its being limited to one syllable; though such is, generally, the case. On the contrary, inflections may coalesce with the root, and so exist without increasing the number of syllables. *Dogs* is as much a monosyllable as *dog*.

Referring to what has been said about loss and non-development in the way of inflection, let us ask whether, assuming a language to be in its first stage, it is therefore a parent language? No. It has simply changed more slowly than others.

This leads to see that the word *old* has two meanings.

The English of America is, in one sense, older than the English of Australia. It separated earlier from the parent tongue.

Yet it may not be the oldest one thousand years hence. Suppose the Australian, by changing the slower, preserves more old forms. In that sense it will be the older language.—R. G. L.]

The Chinese, however, which is the principal, and probably the most ancient, of the monosyllabic languages, is distinguished from almost all others by a more marked peculiarity, which is, that its written characters, instead of depicting sounds, are the immediate symbols of the objects or ideas, and are even imperfectly represented by the sounds, whatever difference of accent or tone may be exhibited by the most refined speaker; as indeed it may happen accidentally in our own language, that we may be at a loss to explain, without circumlocution, whether we mean to say *Son* or *Sun*; *Beer* or *Bier*; *Bear* or *Bare*; *You*, *Ewe*, *Yew*, or *U*; but in the Chinese, the real cause of this essential characteristic appears to be, that the symbol was in fact originally intended as a hieroglyphic or picture of the object, though the resemblance, coarse as it probably was at first, has been generally altogether lost by the

Language. modifications which the character has conventually undergone. And in this point of view the Chinese would require to be classed with the old Egyptian only, since we know of no other language which was habitually expressed in hieroglyphics and their immediate derivatives. It is not at all uncommon for the same sound in Coptic, as in Chinese, to have four or five senses all essentially different, as may easily be observed in turning over a dictionary; *moov*, for instance, means *Bad*, and *Them*, and a *Shower*, in two verses of St Matthew (v. 45, 46), and perhaps several other things.

[This is chiefly a question of writing, not one of speaking; a question concerning the representation of language, not language itself. In the importance of the accent we recognise a point of speech; and it indicates poverty of vocabulary; but the expression of it is wholly a matter of orthography. In the history of the alphabet, the peculiarities of Egypt and China find place; not in the history of language.—R. G. L.]

Another ancient and extensive class of languages, united by a greater number of resemblances than can well be altogether accidental, may be denominated the *Indo-European*, comprehending the Indian, the West Asiatic, and almost all the European languages. If we chose to assign a geographical situation to the common parent of this class, we should place it to the south and west of the supposed origin of the human race; leaving the north for our third class, which we can only define as including all the Asiatic and European languages not belonging to the two former; which may be called *Atactic*, or, perhaps, without much impropriety, *TATARIC*; and which may be subdivided into five orders, *Sporadic*, *Caucasian*, *Tartarian*, *Siberian*, and *Insular*. The *African* and *American* languages will constitute a fourth and fifth class, sufficiently distinct from all the rest, but not intended to be considered as any otherwise united among themselves, than by their geographical situation. There is, indeed, little doubt, that some of the languages here called Tataric are essentially allied to others, which are referred to the Indo-European class; but they have been too little investigated to allow us to make the selection that would be required for completing the classification. [The extent to which this classification is accurate or inaccurate will be seen in the sequel.—R. G. L.]

The following tables are copied, with considerable additions, from Adelung's *Mithridates*. The words *Heaven* and *Earth* are chosen as specimens, because they seem to be known in a greater number of languages than any others, except the name of *Father*, which is supposed to exhibit, in some cases, a fallacious similarity. The German orthography has been principally employed, except in such languages as are usually written in the Roman characters, the pronunciation of the consonants being more uniform than in English, and that of the vowels differing little from the Italian.

[The selection of words representative of rude and unknown languages, has commanded no small amount of the attention of philologues and ethnologists; and many lists, ready prepared, are in circulation—in India and North America more especially. They are none of them unexceptionable; and the reason for their being so lies in the fact of the choice being made on *a priori* views of what words are fundamental and what not. Actual observation tells us, that the most permanent parts of languages are by no means the words that *a priori* speculations indicate.

Among the best words for specimens are the names for *fire*, *water*, *sun*, *moon*, and *star*. *Man* and *woman* are generally ambiguous, the names for them being often the names for *man* and *wife* as well. Hence, unless we have the terms for all four (*man*, *husband*, *woman*, *wife*), we have but half the requisite information. It may also be added, that along with the name for *sun*, the names for *sky* (*heaven*), *light* and *day*, should be given.

The numerals are always of value, because, whether they be of little or great use for the purposes of comparative philology, they have always a value in the history of the arithmetic. Their pure and proper philological importance, however, is inconstant. Sometimes the numerals of two or more languages shall be alike whilst the rest of the vocabulary differs. Sometimes the similitude between the words other than numeral shall be great, the numerals themselves being unlike. In many languages it happens, that if some of the numerals are alike, the others will be so also. In others, on the contrary, it by no

means follows that because (say *one* and *two* are alike, *three* and *four*, &c., should be equally so. As a class, the names of the parts of the human body are, perhaps, the best.—R. G. L.]

The tables will at least serve, notwithstanding some imperfections and uncertainties, as a convenient synopsis for facilitating the reference to a brief sketch of the history of the different families of languages.

1. The strongest proof of the great antiquity of the CHINESE language appears to be the extreme simplicity of its structure, and the want of those abbreviations and conventional implications which have been sometimes called the wings of languages. It is natural that, in attempting to express ideas at once by characters, the rude pictures of material objects should first

have been principally, if not exclusively traced; thus the Egyptians had ,  for the sun and moon, and  for a country

or field, and the Chinese have still , ,  for these objects respectively, the characters having been made square instead of round, which some of them were in their more ancient forms. The Egyptians represented a man by a figure kneeling, and stretching out his hand, or, in the enchorial character, thus . The Chinese figure may originally have been of the same form; but at present is more like a pair of legs only, , whilst a dog seems to have three or four legs,

 or . A thousand, according to Mr Jomard's ingenious conjecture, was copied from the lotus, with its seed vessel, having a great multitude of seeds, and the Chinese  is certainly not altogether unlike the Egyptian ; nor is the character for light , which seems intended to represent a radiant body, altogether different from the  or  so often

found among the hieroglyphics of Egypt, although it is not easy to believe, with Mr Palin, that the manuscripts found with the mummies agree precisely with a Chinese version of the Psalms of David, character for character. The successive introduction of figurative expressions and characters may easily be imagined; but it would be useless to enter at present into further details of this kind, on grounds almost entirely speculative. The Chinese are said to have been, in the ninth century, a race of people resembling the Arabs; their physiognomy was contaminated in the thirteenth and fourteenth by a mixture with their conquerors, the Mongols; but their language remained unaltered. The dialect of Tonkin is sometimes called the language of Anam, and the Guan: on occasions of state they use the Chinese character, but more commonly a character of their own, probably resembling that of the Siamese. Dr Leyden observes, that at least twenty different nations employ the Chinese characters, though they read them quite differently; and he considers the Cochinchinese, the Cantonese, and the Japanese, as all essentially different from the Mandarin Chinese, though they have all some words in common. He gives us as the names of the dialects of Chinese, constituting almost as many separate languages,—1, Kong, spoken at Canton; 2, Way; 3, Nam; 4, Chéu; 5, Séu; 6, Lúi; 7, Limm; 8, Khum, or Mandarin; 9, Siu; 10, Kunng; 11, Hyong san, spoken at Macao; 12, San tahk; 13, Nam kéi; 14, Pán ngi; 15, Tòng khún; 16, Fo khun, or Chín-chow. There is also a language spoken by the Quan tó, between Tonkin and China, a people who consider themselves as more ancient than their neighbours. Notwithstanding, however, all this supposed diversity, we may trace a considerable resemblance in the spoken language, even as far as Corea. In all these dialects, the conversation is a sort of recitative, and the different notes give distinct meanings to the words; as, in fact, we distinguish in English the sense of M? from M! or simply M.; tones perfectly understood, though never written. The Chinese are without the sound of the letter r, and several other sounds common in Europe; the only way in which they express foreign words is by putting together the characters of the nearest import, with a symbol of pronunciation annexed to them; thus, for *Christus* and *Cardinalis*, they are obliged to write *Ki lu su tu su*, and *Kia ul ji na li su*, with a mouth annexed to them. The names of places are generally distinguished by a square inclosing the characters which express them; and the names of men, in some books, by a line drawn on one side of the characters only. In this there seems to be a distant analogy to the ring which incloses proper names in the Egyptian inscriptions, but the names of places were not distinguished in this manner by the Egyptians. The dialects of Cambodia and Laos have received some mixture of Malayan from their neighbours; in writing the former of these, sometimes called *K'hómén*, according to Dr Leyden, the Bali, or old Sanscrit character, is employed; and the latter has some analogy with the Siamese; indeed, both the Siamese and the

Language. AVANESE are disposed to derive themselves from Laos. It may be seen, from the specimens exhibited in the article *PHILOLOGY*, that at least some of the Chinese dialects have sounds agreeing in several instances with European words of the same import; but the agreement is scarcely precise enough to justify our inferring from it an original connection between the languages.

2. The language of SIAM resembles the Chinese in its simplicity and metaphorical structure, though not so decidedly monosyllabic. It is obvious, however, that the distinction of monosyllabic and polysyllabic could not, in very ancient times, have been so positively laid down as at present, since it was usual, in almost all countries, to write the words contiguous to each other in a continued series, without any divisions between them; and, even in modern printing, there is a happy invention, which often restores this agreeable obscurity, under the name of a hyphen, by the use of which we avoid the difficulty of determining whether we wish to employ one word or several. The Siamese call themselves *T'hay*; and a part of their country is distinguished by the appellation *Tai hai*, or Great T'hay. The numerals resemble the Mandarin Chinese; several words of the language are borrowed from the Bali; it is written in an alphabetical character, which is said to be complicated and refined.

3. The AVANESE, or *Burmanish*, has also borrowed some polysyllabic words from the Bali, and is written in a peculiar alphabetical character. It must be considered as an era in the history of this country, that its emperor has employed Mr Felix Carey, at his own expense, to establish a printing press at Ava, his metropolis, for printing a translation of the Scriptures in Burmanish. A dialect, spoken in the district called Tanengrari, is said to be of greater antiquity. The *Môn* or *Peguan* is called by Dr Leyden a distinct original language; but it is written in the Avaneese character; and Adelung's specimen scarcely differs at all from the Burmanish. The language of Arakan and Rashaan is called *Rukheng*; it contains a number of words from the Bali, many of them converted into monosyllables by an imperfect pronunciation. Dr Leyden considers it as the connecting link between the monosyllabic and the polysyllabic languages; and he calls it an original language, notwithstanding its acknowledged derivation from its neighbours. It employs the Devanagiri alphabet, including the letter *z*. Out of fifty words of Rukheng, quoted by Buchanan, the seven which are not Burman are only varieties of pronunciation. The *Kiayn* or *Kolún*, and the *Kukis*, N.E. of Chittagong, are mentioned as neighbouring tribes, speaking languages almost entirely different from the Rukheng. We find, in Mr Buchanan's paper, some specimens of the languages of the Burma empire, which it is difficult to distribute methodically without a further knowledge of their peculiar characters, but some of which may, without impropriety, be introduced here.

	Earth.
Myamtau, in Burma	(Head, Kaung; Wind, Mysagee Lae)

Rooinga	(Head, Mata; O, Bel)
Rossawn, Arakan	(Head, Mustok; O, Murtiha Sooja)
Banga, or Ayhoba	(Head, Teekgo; O, Matee Baylee)

4. The language of TANGUT, or the Tangutish, has some words in common with the Chinese, but is less simple in its structure. It is at least as ancient as the religion of the country, which is nearly coeval with Christianity. Its character is

well known to be alphabetical, from the title of the learned *Language* work of *Father Georgi* on the subject.

[The Anamitic of Tonquin and Cochinchina is a separate language, with Chinese affinities.]

The Môn of Pegu is (what Dr Leyden makes it) a separate language from the Burmese.

The Rukheng is Burmese.

Nothing has to be subtracted from this class. The additions, however, are numerous.

1. Numerous forms of the speech of the ruder branches of the Burmese—viz., Kariens, tribes of the Yuma Mountains, tribes of the interior of Aracan.
2. The same in respect to the Siamese—Khamti, Laos, &c.
3. Forms of speech, with Burmese affinities—more or less close—from Sylhet, Tippera, Chittagong, Manipur, and the southern frontier of Assam—Naga, and other dialects.
4. Forms of speech from the northern and eastern frontiers of Assam—more or less Burmese, Siamese, and Tibetan—Jili, Singpho, Mishimi, Abor, Aka, Dofla, &c.
5. Sub-Himalayan forms of speech—Garó, Kooch, Bodo, Dhimal, &c.
6. Sikkim and Nepal forms of speech—Lepcha, Limbu, Murmi, Newar, &c.
7. The Chepang of Kumaon.
8. The Andaman.
9. The language of the Nicobar Islands.

10. The languages (Sifan) of the ruder parts of China.—R. G. L.]

5. The *Indo-European* languages have been referred to a single class, because every one of them has too great a number of coincidences with some of the others to be considered as merely accidental, and many of them in terms relating to objects of such a nature that they must necessarily have been, in both of the languages compared, rather original than adoptive. The *SANSKRIT*, which is confessedly the parent language of India, may easily be shown to be intimately connected with the Greek, the Latin, and the German, although it is a great exaggeration to assert anything like its complete identity with either of these languages. Thus, we find, within the compass of the Lord's Prayer only, *Pida*, *Pitir*, among the Sanscrit terms for Father; Gr. *Pater*. *Nama*, or *Namadhya*, for Name; Gr. *Onoma*, *Onomati*. *Radshiam*, Kingdom; Lat. *Regnum* from *Rego*. *Manasam*, Will, like the Gr. *Menio*, and the Latin *Mens*. *Sitra*, Earth; Gr. *Era*, whence perhaps the Latin *Terra*: and *Danim*, or Devanagiri *Dia*, Day; Lat. *Dies*. There are also some singular resemblances of declension and conjugation between the Sanscrit and the Greek, *Dodami*, *Dodasti*, *Dodati*; in old Greek, *Didomi*, *Didoti*, *Didoti*. In a tablet of the date 23 B.C. we find *Kritiko* for a Judge, Gr. *Crites*, *Criticos*. In Mr Townsend's work we also find some well-selected instances of resemblance between the Sanscrit and other languages: thus, *Bhru*, is Brow; *Pota*, a Boat; *Bad*, a Bath, Germ. *Bad*; *Dhara*, *Terra*; *Nava*, *Novus*; *Nakta*, *Nocte*, Night; *Pad*, Foot, *Patte*; *Pruthama* or *Protoma*, First, whence we deduce both the Greek *protos* and the Latin *primus*; and *Upadesaca*, *Didasco*, *Doceo*, and *Disco*. We have also *Vayajan*, Wind; in Russian, *Vieyante*: and *Vilhuva*, Widow; Latin, *Vidua*; German, *Wittwe*; Russian, *Vidova*. The *NT* of the plural verb is found in the Sanscrit *Bhuvanti*, They are; *Dadanti*, They give. Sir William Jones and many others have attributed to some of the works which are still extant in Sanscrit an antiquity of 4000 or 5000 years; but Professor Adelung denies the validity of any of the arguments which have been adduced in favour of a date at all approaching to this.

The Sanscrit, even in its earliest state, can scarcely have been altogether uniform throughout all the countries in which it was spoken, and it has degenerated by degrees into a great diversity of modern dialects: the term signifies learned or polished. Beyond the Ganges, it is called *Bali* or *Magudha*, which, the missionaries say, "scarcely" differs from Sanscrit; the term *Magudha* is said to mean mixed or irregular. In Siam the Sanscrit is still the language of elegant literature; and it is often employed throughout India, with some little difference of construction, under the name of *Devanagari*, the divine language. The *Prakrit* is rather a vague term, meaning, according to Mr Colebrooke, common or vulgar; but it is also applied to the language of the sacred books of the "Jainas." We find in a little publication, entitled a *Brief View of the Baptist Missions*

Language. and Translations, some useful information respecting the Indian languages and dialects, into a great number of which these laborious and disinterested persons have made or procured translations of the whole of the Scriptures, which they have printed at Serampore, near Calcutta. The dialects which they enumerate are principally arranged in a geographical order; and, beginning with those which are spoken towards the middle of India, as the pure *Sanscrit* and its least modified dialects, we may place next to them the languages of the countries bordering on the monosyllabic nations, toward the N. and E. We have here the dialects of *Nepal*, *Assam* or *Uthumiya*, *Tipperah*, and *Kassai*, of which little more is known than that translations into the first two have been already executed. The *Bengalee* is spoken in and about Calcutta. The *Hindee* or *Hindwee* is spoken about Agra; it is printed in the Devanagri character, the font of which contains more than 800 varieties of letters and their combinations. The *Urdu* or *Oordoo* is a sub-dialect of the Hindee, as well as the *Brijbassa*, which is nearer to the Sanscrit than some other dialects. The *Jypura* is mentioned as another language belonging to the same neighbourhood. The *Hindustanee* is spoken in Hindustan Proper, or Lower Hindustan; the missionaries say it is "diagrametrically different" from the Hindee. The *Moors* or "Mongol Indostanish" seems to belong to this country, being mixed with a good deal of Persian and Arabic, unless it be rather referable to the Hindee. The dialects of *Udaipura*, *Benares*, and *Munipura*, are also called separate languages. The *Goandee* is spoken at Nagpore, in the Mahratta country. Further east is *Orissa* or *Uriya*, the language of which is printed in a character requiring 300 different types. The *Telug* or *Warug* is spoken about Cuddalore and Madras: the *Telinga* further west. The *Carnatic* has a peculiar language, besides the *Tamul*, which is spoken from Paleacate, near Madras, to Cape Comorin, and the *Marwa*, which appears to belong to a part of this country. About Cochin in Travancore we have the *Maleiam*: further north, the languages of *Malabar*, *Kanara*, and of the *Deccan*. The dialect of Malabar is of considerable antiquity, being found in two copper tablets as old as the eighth or ninth century. Then comes the *Kunkuna*, about Bombay. The *Mahratta* is further inland; the *Guzerat* on the coast; and, beyond the Indus, the *Beloshee* in Belochistan. North of this we find the *Afghan* or *Pushtu* language, which contains more Hebrew words than any of its neighbours; the people are said to have come from the N. about 2000 years ago, and, according to a Persian tradition, to be descended from King Saul; indeed, the language stands somewhat more correctly under the Median family in the *Mithridates*, but since it forms the connecting link between the two families, it might perhaps be as conveniently arranged among the more numerous species of the Sanscrit; it is written in the Arabic character, with some additional letters for expressing the Sanscrit sounds. The language of *Multan*, N. of Sindh, has about one-tenth of Persian mixed with it. The *Gipsies* were certainly expelled from some part of India by the cruelties of Timur Leng, about the year 1400; and there were probably some of the *Zingans* in the neighbourhood of Multan, their language having a great number of coincidences with that of Multan, and being still more manifestly a dialect of the Sanscrit, although they have adopted many European, and especially Slavonian words. When they first appeared in Europe, they were supposed to amount to about half a million; at present they are less numerous.

The *Maldivian* is peculiar to the group of small islands from which it is named; the Baptists have already printed some books in it. The people are said greatly to resemble those of Ceylon. The *Cingalee*, which is spoken in great part of Ceylon, is a mixture of several of the continental dialects; and it has been observed, that the proper names in Ceylon mentioned by Ptolemy are of Sanscrit origin.

[The Sanscrit can scarcely be called "confessedly" the parent language of India. That the languages of the Dekhan are Sanscrit, only in the way that English is Latin (*i.e.*, in respect to some incorporated elements), is generally admitted. That the northern forms of speech are Sanscrit is beginning to be doubted. That their vocabulary is largely Sanscrit is certain. Not so, however, their grammar. The forms of speech that, at one and the same time, are most generally treated as separate languages, and, at the same time, most especially believed to be of Sanscrit origin, are—

1. The Hindui, *i.e.*, the Brijbasa of the text.
2. The Gujerathi of Gujerat.
3. The Udiya of Orissa.
4. The Bengali.
5. The Mahratta.

The Multan, Punjab, Scinde, Rajasthan, Cashmerian, and other less important forms of speech, belong to this division, and chiefly approach the Hindui section of it.

The Hindostani is a *Lingua-Franca*, rather than a true native form of speech.

On the other hand, the Teluga, Telingga, Canarese (or Carnatic), Malayalim, and Kunkuna (or *Kunkar*), are all *Tamul*; as are all the Todah, Glond, Khond, and Kol dialects; as well as that of the Rajmahali mountaineers, on the very verge of the Ganges, and within 100 miles of the southern boundary of the sub-Himalayan monosyllabic tongues.

The basis of the Maldivian and Cingalese is *Tamul*; the place of many of the Bhil dialects being, if not in the *Tamul* class, at least intermediate.

In Biluchistan the Biluch is not the only language. The Brahui of the mountains is spoken concurrently with it, and that is *Tamul*, or South Indian.

Of Nepal, Assam, Tipperah, and the Kasia country, the native dialects are all monosyllabic. It is only the intrusive forms of speech that are Indian.

The Afghan and Biluch are Persian, rather than either *Tamul* or Northern Indian.—R. G. L.]

Dr Leyden gives, as a proof of the antiquity of the *Malayan*, that the *Temala* of Ptolemy is derived from *Tema*, tin. The connection of this language with the Sanscrit has not been very universally admitted; and some of those who have studied it most are disposed to consider it as wholly original; but, in the purest part of the language, Dr Leyden confesses that there is a considerable resemblance to the Avanes and the Siamese; the words derived from the Sanscrit he considers as somewhat less numerous, amounting, however, to about 5000; they are generally less like the Bali than the Sanscrit, and a still smaller number are borrowed from the Arabic. The character of the monosyllabic languages is in some measure retained. Sir William Jones considered the *Malayan* as a derivative of the Sanscrit; Mr Marsden supposes it to have received its Sanscrit words through Gujerat; Dr Leyden rather from Kalinga or Telinga; and it exhibits some traces of the dialects of *Tamul* and *Maleiam*. Besides these various sources, it is said to have borrowed some of its simplest words from the Javanese and the Búgis; and it has become more nearly monosyllabic by dropping the first syllables of some of the words which it has adopted. The *Javanese* is said to be more ancient than the *Malayan*: the empire of Java was formerly powerful and flourishing: the ancient language was much like the Sanscrit, more so than the *Malayan*, but was written in a peculiar character. Dialects of this language are still spoken in Bali and in Madura. Leyden thinks the Malays were derived from Java; Marsden rather from Sumatra, though he allows that there are some reasons for conjecturing that an old Sanscrit colony may have settled many hundred years ago in Java, and mixed its language with a supposed mother tongue of that Asiatic race.

Of the *Sumatran* dialects, the principal, according to Dr Leyden, is the *Batta*, spoken by a people who occupy the centre of the island, and who still, like some other Indian nations, retain the custom of eating their old relations. The language seems to be partly original, and partly connected with the *Malayan*; and other dialects of the neighbouring islands. The *Rejang* is chiefly a mixture of *Batta* and *Malayan*; in the *Lampuhn* or *Lampung* there is also some Javanese. The *Achi* has admitted a still further influx of words belonging to all the Mussulman jargons of the neighbourhood, especially to that of the Mapulas of Malabar. There are other dialects of less note in Néas and the Pogygy Islands, most resembling the *Batta*. This language is provided with a peculiar alphabet, which is remarkable for being written from the bottom of the paper upwards, like the Mexican hieroglyphics; though the Battas, as well as the Chinese, sometimes hold their books so as to read horizontally. In Borneo there appear to be several dialects, or rather separate languages; two of them, according to Dr Leyden, are the *Biaju* and the *Tisun*.

[The Malay is nearest the southern members of the mono-

Language.

Language. syllabic stock. In Malacca and Sumatra it is spoken with little variation, with more in Borneo, more still in Java and Celebes, and the Philippines. It then passes through the intermediate forms of Lord North's Island, the Pelews, &c., into the Micronesia of the Carolines and Mariannes; thence on to the Polynesian of the Navigators' Isles and all the islands between New Zealand S. and the Sandwich Isles N.; the Fijis W., and Easter Island E. The islands between Java and Timor (the latter included) are Malay. So is, to a great extent, the language of Madagascar.

The numerous mutually unintelligible languages of Australia are connected with some of the ruder forms of speech of Timor, Ombay, &c., being also radically connected with each other. The extent to which they are other than Malay being greatly exaggerated.

In New Guinea, the Louisiade, New Ireland, &c., the languages are Papuan, mutually unintelligible to a great extent, yet related, and touching the Malay tongues in the Arru Isles.

The Tasmanian of Van Diemen's Land is perhaps more akin to the New Caledonian than to the Australian, as if the stream of population had gone round Australia rather than across it.

A Malay form of speech is spoken in Formosa. The languages of all the wilder tribes of the Peninsula of Malacca and the larger isles is, even when they are more or less black, Malay.—R. G. L.]

The *Andaman* language is inserted here for want of a better place only; it does not appear to have any connection with the Sanscrit, and may possibly be found to be more like that of Madagascar: the people seem to belong to the Papuas, a distinct original race, according to Dr Leyden, black, and with woolly hair.

[The Andaman is nearest the languages of the opposite coast, i.e., the Burmese.—R. G. L.]

Besides the numerous translations into languages of the Indo-European class, the Baptist missionaries have also printed some Armenian and Persian works at the indefatigable press of Serampore, which is supplied by a letter-foundry and a paper-mill, belonging to the same establishment, enabling them to execute the whole business at less than half the expense of European books of the same magnitude. The little pamphlet already quoted contains also specimens of the characters of the Sanscrit, Assam, Bengalee, Mahratta, Sikh, and Cashmirian, which somewhat resemble each other in the square form of their characters; as well as of the Burman, Orissa, Telinga, and Cingalese, which have a more rounded and flourished appearance; of the Tamul, which looks a little like Armenian; of the Afghan and the Persian used in India; and of the Chinese, both as printed from blocks, and from the moveable metal types which have been cast at Serampore.

6. The connection of the *MEDIAN* family with the Sanscrit on one side, and with the Greek and German on the other, is sufficiently proved by the words *Abitap*, Zend. Sun; Sansc. *Abitaba*. *Dar*, Ter, Pers. Door; Sansc. *Dura*, *Tuvara*; Javanese, *Turi*; Gr. *Thira*; Germ. *Thür*, *Thor*. *Dip*, Pers. Land or Island; Sansc. *Dihp*. *Dochtar*, Pers. *Pothré*; Zend. *Daughter*; Gr. *Thügater*; Germ. *Tochter*; Sansc. *Putri*. *Jaré*, Zend. Year; Sansc. *Jahran*; Germ. *Jahr*; and *Ishk*, Zend. Love; Sansc. *Itsha*. To this list we may add, from Dr Leyden, *Stree*, Zend. Woman; Sansc. *Stri*. *Asié*, Zend. He is; Sansc. *Asi*; Gr. *Esti*. *Hapté*, Zend. Seven; Sansc. *Saptah*; Gr. *Hepta*. There are also some coincidences with the Chaldee, but the Median is certainly not a dialect of the Chaldee. Sir W. Jones and others have said that the Zendish was nearest to the Sanscrit, and the Pehlvi to the Chaldee or Arabic. In ancient Media, the *Zendish* was the language of the northern, and the *Pehlvi*, or *Parthian*, of the southern parts; the word Pehlvi, or Pahalevi, is supposed by Leyden to have been nearly synonymous with Pali or Bali, though this is said to be derived from Bahlika, an Indo-European country. The Zendish was more particularly appropriated to religious purposes, and the Pehlvi had in a great measure superseded it for common use at a very early period. Under the Sassanides, again, from the third to the seventh century, the use of the Pehlvi was discouraged, and the old Persian substituted for it. It is said, however, that in the remote parts of the country, about Shirwan, some traces of the Pehlvi may still be found

in existence. The *Zendavesta* of Zoroaster, which is still extant in Zendish, is said to have been written 520 years B.C.; and Adelung follows Anquetil in asserting its authenticity, even in opposition to the opinion of Jones and Richardson. These languages have little or no connection with the Georgian and Armenian, which have succeeded them in some of the same countries. The old Persian, which seems to be much connected with the Pehlvi, has remained in use, either as a living or as a learned language, ever since the time of the Sassanides: it was current among the Persians when they were conquered by the Arabs in the seventh century; and it is the language of the *Shah Nameh* of Firdusi, written in the tenth century, as well as of the *Ayeen Akbery*, of which the date is about 1600. The modern *Persian* became a cultivated language about the year 1000, having received a considerable mixture of Arabic and Turkish words. The term *Parsee* is commonly applied to a corrupt Pehlvi, spoken by the refugee fire-worshippers in Bombay.

The Goths are said to have inhabited, for some centuries, the countries about the Black Sea, and may originally have bordered on Persia. From this circumstance, and probably also from the effects of a later irruption of the Goths into Persia, which is recorded in history, we may easily explain the occurrence of many Persian words in German, and in the other languages of Northern Europe. Professor Adelung has examined more than two hundred cases of such resemblances, and has found only one sixth part of them in Anquetil's vocabularies of the more ancient dialects. He has, however, omitted to state what proportion the whole magnitude of these vocabularies bears to that of a complete dictionary of the language. It is well known that an essay was published a few years since in London, *On the Similarity of the Persian and English Languages*; and a more elaborate work on the relations of the Persian languages, by M. Lepileur, has since appeared in Holland. M. Lepileur attempts to explain the *is* or *s* of the genitive of the northern languages by the Persian preposition *ez*, which seems to be synonymous with the Greek and Latin *ex*; but he has not shown that this *ez* ever follows the noun to which it relates.

The *Kurds* speak a corrupt dialect of the Persian; they are probably derived from the Carduchi of the Greeks, who inhabited the Gordiæan Hills. They spread into Persia about the year 1000, and are now situated on the borders of the Persian and Turkish dominions. The language of the *Afghans*, about Candahar, is said to contain about one-fourth of Persian, and some Tartarian, besides the Sanscrit which abounds in it.

[The term *Median* appears to mean the languages allied to either the Zend or the modern Persian; and as few writers (of which, however, the present is one) hesitate to derive the latter from the former, this meaning may stand; subject, however, to future correction.

Zend is so akin to the Sanscrit, that a class of any convenient magnitude must contain both. If so, their descendants should be in the same class also, viz., the modern Persian and the North Indian dialects. The complications and difficulties that arise out of this are considerable.

The Zend is the language of the *Zendavesta*; and closely allied to it is that of the Cuneiform inscriptions.

The Pehlvi is the language of the Sassanian inscriptions.

It is safer to write thus than to distribute the languages thus named geographically.

There are difficulties in deriving the modern Persian from the Zend, and there are difficulties in not doing so. In the mind of the present writer, the former outweigh the latter. Suppose that, after the Macedonian kingdom of Ilætria was formed, the successors of Alexander had extended their conquests into Tibet; that they filled the country with inscriptions in Macedonian Greek, and that a Greek literature was developed. Time goes on, and the Greek language changes. It takes in some words from the original Tibetan; it gives more, say thirty, forty, fifty per cent. Meanwhile, the original monosyllabic and uninflected character of the native language is preserved. Modern scholars investigate it; they note the number of Greek words; they note, too, the absence of the Greek inflections; they infer that the Tibetan is a language of Greek origin, being once, but now no longer, inflectional; just like the English

language. as compared with the Anglo-Saxon; or the Italian as compared with the Latin.

All this is wrong. The non-inflectional character of the Tibetan arises, not out of the facts of inflections having been lost, but out of the fact of their never having been developed. Nevertheless, a historical series of changes that never existed is inferred.

The real relation of the Greek to the Tibetan is that of the Latin (not the Anglo-Saxon) to the English. The real history of the want of inflections is the opposite of the one assumed. A change from the inflected to the uninflected stage of a single language is simulated. The actual fact is the incorporation of a large (say an inordinately large) percentage of words from a polysyllabic to a monosyllabic tongue.

Write Zend for Greek, and Persian for Tibetan, and the modern language of Ispahan and Teheran appear as descendants from the Zendavesta and arrow-headed forms of speech. Apply the criticism suggested by the erroneous character of the preceding inference, and this affiliation becomes doubtful. Such criticism, however, has yet to be applied.

Mutatis mutandis, the same applies to relations of the Sanscrit to the North Indian dialects.

The Biluch is Persian.

The Afghan belongs to the same class.

Again, an important group, that by slightly raising the value of this class can be referred to it, or (if this be inconvenient) may stand as a closely allied order, is one for which our data are quite recent. It contains the languages of some of the northern tribes of Afghanistan, the Kohistan of Cabul, Kaferistan (Siaposh), the head waters of the Oxus, Chitral and Hunz-Nagor. The present writer has called this the Paropamisian group.

The present writer, holding that the comparative absence of inflections of the Persian arises not from loss, and from non-development (the same applying to the North Indian forms of speech), stands perhaps alone in placing it, with its congeners, in immediate connection with the monosyllabic languages,—the Zend and Sanscrit (the *apparent* mother-tongues) being widely separated from them, though closely allied to each other.

If this be true, the Indian tongues are those where the basis is Tamul rather than monosyllabic; the Persian those where it is monosyllabic rather than Tamul.

More, however, will be said about this in the sequel; also something about the Goths.—R. G. L.]

7. The ARABIAN family is called by the German critics *Semitic*, from Shem the son of Noah, as having been principally spoken by his descendants. Though not intimately connected with the European languages, it is well known to have afforded some words to the Greek and Latin; it has also some in common with the Sanscrit, though apparently fewer than either the Greek or the German. Thus we have *Áter*, Heb. a Husbandman; *Ager*, Lat. a Field. *Asther*, a Star; Gr. *Aster*. *Bara*, *Buri*, Germ. Burg. *Ben*, Heb. Son; Sansc. *Bun*, Child. *Esh*, Heb. *Eshta*; Chald. Fire; Sansc. *Aster*. and *Ish*, Heb. Man; Sansc. *Ishá*, Man or Lord. The Hebrew *Ani*, *Anoki*, I, has been noticed by Townsend and others as affording an etymology for *Ego* as well as *Ni* or *Mi* of verbs, for the *Anok* of the Egyptians, and even for the *Ngo* of the Chinese.

The northern nations of this family have sometimes been comprehended under the name *Aramaic*, in contradistinction to the middle or Canaanitish, and the southern or Arabian. The Eastern Aramaic, or old *Chaldee*, is very little known; it was the language of a people situated in the north of Mesopotamia, which is now the south of Armenia; a part of them extended themselves further south, and became Babylonians, of whose dialect some traces are said still to exist about Mosul and Diarbeker. The old Assyrians, between the Tigris and Media, were a colony of the Babylonians, and spoke a language unintelligible to the Jews (2 Kings xviii.) The Western Aramaic has become known, since the Christian era, as the Syriac, in which there is an ancient and valuable translation of the *New Testament*. It is still spoken about Edessa and Harran. The Palmyrene was one of its dialects; the modern *Assyrian* of the Russian vocabularies appears to be another.

The language of the Canaanites is said by St Jerome to have been intermediate between the Hebrew and the Egyptian. The people are supposed to have come originally from the

Persian Gulf; the Philistines, who were found among them to have emigrated from the Delta to Cyprus, to have been thence expelled by the Phœnicians, and to have adopted the language of the Canaanites when they settled among them. The book of Job is considered as affording some idea of the dialect of Edom; it is well known to contain many Arabisms, besides some other peculiarities. The *Phœnician* is only known from a few coins and inscriptions found chiefly in Cyprus and in Malta, and not yet very satisfactorily deciphered; though Akerblad is convinced, by some of them, that it varied but very little from the Hebrew; of its descendant, the *Punic*, or Carthaginian, a specimen is preserved in the speech of Hanno in Plautus, as happily arranged by Bochart; the objection of Adelung, respecting the want of a proper name, appearing to have arisen from a mistake. The last six lines of the text are probably either a repetition of the same speech in the old Libyan of the neighbourhood, or a jargon intended to imitate it.

The *Hebrews* originated among the Chaldeans, Terah, the father of Abraham, having been a native of Ur, or Edessa, beyond the Euphrates. They adopted the language of the Canaanites, among whom they led a nomadic life, till their residence in Egypt, which must probably have had some effect in modifying their language. After that time, however, it appears to have varied but little in a period of 1000 years, from Moses to Malachi; and this circumstance Adelung considers as so uncommon and improbable, that he is disposed to believe that the writings of Moses must have been modernized at least as late as the time of Samuel. The old Hebrew became extinct, as a living language, about 500 B.C.; 1000 years afterwards the Masoretic points were added, to assist in its pronunciation: and this was done in some measure upon the model of the Syro-Chaldaic, which at that time was still spoken. The Septuagint version, which is much older, supports, in the instances of many of the proper names, the reading indicated by the points; but in about as many others it appears to deviate from that system, and to agree with a mode of pronunciation founded upon the text or principal characters alone. The reading in Greek letters of Origen, in his *Hexapla*, tends, on the whole, very strongly to support the points. The *Chaldee* had superseded the Hebrew at the time of the captivity, and was gradually converted into the *Syro-Chaldaic*, which is called Hebrew in the New Testament. The Targums, and the Talmud of Babylon, are in the older Chaldee; and a Syro-Chaldaic translation of the New Testament has been discovered to be still in existence.

The *Samaritan* somewhat resembles the Chaldee. It was formed among the Phœnicians and others, who occupied the habitations of the ten tribes when they were carried into captivity by Salmanassar and Esarhaddon. Its peculiar alphabet is well known as a mere variation of the Hebrew.

The *Rabbinical* dialect was principally formed in the middle ages, among the Spanish Jews, who were chiefly descended from the inhabitants of Jerusalem; while those of Germany and Poland were generally Galileans, and spoke a ruder dialect of the Hebrew than the fugitives from the metropolis.

The *Arabs* have been a distinct, and, in a great measure, an independent nation, for more than 3000 years. Some of them were descended from Shem; others, as the Cushites, Canaanites, and Amalekites, from his brother Ham. Their language, as it is found in the Koran, contains some mixture of Indian, Persian, and Abyssinian words. Its grammar was little cultivated until a century or two after the time of Mohammed. It is certainly copious; but its copiousness has been ridiculously exaggerated and absurdly admired. The best Arabic is spoken by the upper classes in Yemen; in Mecca it is more mixed; in Syria corrupt, and still more so in some parts of Africa. There are dialects which require the assistance of an interpreter to make them intelligible; at the same time, it has been maintained by Atyda, a learned Arab of Syria, in contradiction to Niebuhr, that the Arabic of the Koran is still employed in conversation among the best educated of the people, as well as in correct writing. The *Atabís* living in houses are called *Moors*, and those of Africa are the best known under this name. The *Mapuls* or *Mapulets* of Malabar and Coromandel are a numerous colony of Arabs, who have been settled there above a thousand years.

Language.

The *Ethiopians* are descended from the Cushite Arabs. In the time of Nimrod they conquered Babylon; before that of Moses they emigrated into Africa, and settled in and about Tigri; in Isaiah's time they seem to have extended to Fez; and at present they occupy Tigri, Amhara, and some neighbouring countries. They became Christians in 325, but retained the initiatory ceremony of the Jews and Mussulmans. The pure or literary Ethiopic is called *Geez*, or *Axumitic*, in contradistinction to the Amharic, by which it was superseded as the language of common life in Amhara about the fourteenth century, although it is still spoken, without much alteration, in some parts of *Tigri*; while in others, as in *Hawusa*, a different dialect is spoken. The Ethiopic was first particularly made known in Europe by the elaborate publications of Ludolf. Mr Asselin has since procured a translation of the whole of the Bible into the Amharic, as it is now spoken at Gondar; it was executed by the old Abyssinian traveller who was known to Bruce and to Sir William Jones, and was afterwards put to press at the expense of some of the British societies.

The *Maltese* is immediately derived from the modern Arabic, without any intervention of the Punic. The island, having been successively subject to the Phœacians, Phœnicians, Greeks, Carthaginians, Romans, and Goths, was subdued by the Arabians in the ninth century; in the eleventh the Normans conquered it; and it remained united with Sicily until it became in some measure independent, under the Knights of St John.

[There is nothing to be subtracted from this group. In the way of addition, it contains the *Gafat* of Ethiopia.]

The *Semitic* tongues graduate into the other African tongues by means of a class for which the name *Sub-Semitic* has been suggested, containing—

1. The *Coptic* of Egypt, which has affinities with the *Bisharye*, the *Nubian*, and the *Galla*.

2. The *Amazirgh* or *Berber* tongue, leading to the *Bornu*, *Haussa*, and other languages of Central Africa.

3. The *Agow* and other allied tongues of Abyssinia. These are, perhaps, absolutely Semitic.—R. G. L.]

8. The *LYCIAN* is only known from a few short inscriptions copied by Mr R. Cockerell, and published in Mr Walpole's collection, together with two or three longer ones, which have been lately brought from Antiphellos by the enterprising and indefatigable Mr W. J. Bankes. By means of a proper name in one of Mr Cockerell's inscriptions we obtain a part of the alphabet; thus *i* is *A*; *Δ*, *D*; *E*, *I*; *P*, *R*; *Σ*, *S*; and probably *Λ*, *H*; and *ι*, *L*. A further comparison of the different parts of the other inscriptions with the Greek phrases that almost uniformly accompany them, implying "FOR HIMSELF AND HIS WIFE AND CHILDREN," gives us the words *A*, or *AT'-HI*, *himself*; *SA*, *his*, or *for his*; *HRDI*, or perhaps *HRDI*, *wife*; *TIDAIMI*, *son*; *TIDAIMA*, *children*; and *ATBI*, *and*. It does not appear that any of these words would authorize us to place the *Lycian* language as a member of the great Indo-European class; but it is reported to have been much mixed with Greek, and, on account of its geographical situation, it may be allowed to occupy a temporary rank between the principal oriental and European languages. If it has a shadow of likeness to any other language, it is perhaps to the *Cimbric*; and *Tidaimi* may also possibly be allied to the Greek *Titheno*, to nurse.

9. Respecting the ancient *PHRYGIAN*, we have a few traditions only, which at least agree in giving it a high antiquity, as the source of several Greek words. Thus, Plato observes, in his *Cratylus*, that the terms denoting *fire* and *water* are not derived from any other Greek words, but are Phrygian primitives. It seems, however, that water was called *Bedu* by the Phrygians, and the word resembles the *Bada*, *Bath*, of the northern nations, as well as the *Vate*, water, of the Swedes. *Moirai*, the fates, derived from the Phrygian, is compared to *Meyar*, virgins, of the Gothic; and *Bek*, bread, is as much like our *Bake*, as like the Albanian *Buk*, bread.

10. The *GREEK* has no very intimate or general connection with any of the older languages which have been preserved entire, although there are a number of particular instances of its resemblance to the Sanscrit, some of which have been already mentioned; it has also many German and Celtic words, some

Slavonian, and, as it is said, a few Finnish. It can only have been immediately derived from the language of the neighbouring Thracians and Pelasgians, who seem to have come originally from the middle of Asia, through the countries N. of the Black Sea, and to have occupied not only Greece and Thrace, but also the neighbouring parts of Asia Minor, where they probably retained their ancient dialect to a later period than elsewhere. The whole of the Thracian states were greatly deranged by the expedition of the Celts in 278 B.C. which terminated in their settling the colony of Galatia. The Dacians, or Getæ, who principally occupied Bulgaria, extended themselves further northwards, and afterwards constituted the Roman provinces of Mœsia and Dacia, which were conquered by the Goths in the third century. The Macedonians, in the time of Alexander, spoke a language which was nearly unintelligible to the Greeks in general; even the Pelasgi in Epirus and Thessaly long retained a dialect materially different from their neighbours, and in Arcadia still longer. The Hellenes, who emigrated from Asia Minor into Greece, were not sufficiently numerous to carry their own dialect with them, although the language assumed their name. The Græci in Italy were Pelasgians, although Dionysius of Halicarnassus includes them in the denomination Hellenic; their language must have been *Æolo-Doric*, and it was in this form that the Latin received its mixture of Greek; the Lacedæmonian also retained it till a late period, writing, for instance, instead of *Pais*, *I'oir*, as in Latin *Puer*. The *Æolic* appears once to have extended over Attica, and to have left some *Æolisms* in the old Attic dialect. This dialect was the principal basis of the common language of Greece at a later period, which must have been the most cultivated under the protection of the court of Alexandria, and which continued to be spoken and written in the highest circles of Constantinople throughout the middle ages. By degrees it degenerated into the modern *Romaic*, having received a mixture of Turkish and Italian, and perhaps of some other neighbouring languages.

11. The *GERMAN* family is sufficiently connected with a variety of others belonging to the Indo-European class to be admitted into it upon a very short investigation. Its resemblances to the Greek, within the compass of the Lord's Prayer, besides Father and Name, are *Wille*, *Wollen*, Gr.; *Brot*; perhaps *Brot* or *Proat*, bread, like *Arτος*; and *Freyen* or *Lösen*, like *Rhûein* and *Lûsein*. Dr Jamieson has shown very clearly, in his *Hermes Syglicus*, how immediately the structure of the Gothic languages is derived from that of the Greeks. Thus the *EN* of the Greek infinitive became in the *Mæso-Gothic* *an* or *ian*, in German *en*. The *ICOS* of the adjectives, *Mæso-Gothic*, *ags*, *igs*, or *egos*, as *mahtēigs*, mighty, Germ. *machtig*; the Slavonians have *ski*, the Swedes *sku*. The *INOS*, Lat. *ENUS*, Anglo-Saxon *FN*. The *LICOS*, Latin *LIS*, German *LICH*, English *LIKE*; thus *pelicos* is *what like*, at least in Scotland; the *Mæso-Gothic* *swaleiks* is our *such*; *samaleiks* is *similis*. *LOS*, *LIS*, *LION*, of diminutives, in Latin *LUS*, becomes in *Mæso-Gothic* *ilo*, as *barnilo*, a little child; in German *mannl* is a little man. Among the pronouns we have *ego* in Greek and Latin, *Mæso-Gothic* *ik*, Icelandic *eg*, Swedish *jag*; *emou*, *mov*, Gr., Latin *MEI*, *Mæso-Gothic* *MEINA*, German *MEINER*; *emoi*, *moi*, Latin *MIHI*, *Mæso-Gothic* *MIS*, Swedish *mig*, Dutch *my*; *emv*, *me*, Latin *ME*, *Mæso-Gothic* *MIK*, Anglo-Saxon *ME*, Dutch *my*. *Su*, Doric *TU*, Latin *TU*, *Mæso-Gothic* *THU*. *Is* in Latin, *Mæso-Gothic* *is*; *esv*, *Mæso-Gothic* *is*, *izos*; *id*, *Mæso-Gothic* *ITA*, English *IT*. *Quis*, *cujus*, *cui*, *quem*, *Mæso-Gothic* *quias*, *quins*, *quie*, *quiana*, the last having the *N*, as the Greek *NON*. *UTER*, *whether*, *ALTER*, *other*, seem to be derived from *ANTHER*, *ENTHERA*, meaning *one of them*, so that in this instance the Gothic has the appearance of the greater antiquity, while the Greek affords, on the other hand, an etymology for *EXTEROS*, from *EXEI*, *there*, which is wanting to the *Mæso-Gothic* *GAINS* or *JAINS*, the *Alemannic* *GENER*, the German *JENER*, and the English *YONDER* or *YON*. Again, among the numerals, *DEKA* has been derived from *DEO*, as if both hands were tied together; and *FINTE* has a strong resemblance to *PANTA*, as if *all* the five fingers were reckoned; and, on the other hand, *da cuig* in Gaelic, meaning twice five, has been considered as the original of *DECA*. But none of these etymologies seems to be so decisive of originality as that of *caterva*, which is evidently related to *turba* or *turma*, while the first syllable remains unexplained in Latin; but in the

Language.

Language. Celtic we have *cad tarf*, or *cath tarf*, a war troop, agreeing undeniably with the sense. For another example, we may take *ventus* and *wind*, for which we find no Latin etymology, while the German furnishes us with *wehen*, to blow, and thence *wehend* and *wind*. The words *nodus* and *knot* afford also a similar instance; *nodus* having nothing nearer to it in Latin than *neo*, to spin, *necto*, to unite; but in German we have *knutten*, to join, and in English *knit* and *knead* from the same root. The degrees of comparison are expressed in Greek by *EROS* and *ISTOS*; in Anglo-Saxon by *ER* or *ERA*, and *IST* or *AST*. *Er* seems to mean *before*, as well as the Latin *or*. The Coptic has no comparative; but for *better than I*, the Egyptians said *very good before me*. It would seem at first sight natural to make *than* a preposition, as well as *before*, and to say *better than me*; but the fact is, that in English, as well as in German, it was usual of old to say *then or denn* in this sense; and *he is wiser than I* meant only, *he is wise before, then I follow*. The idea of time or place is now dropped as unessential to the kind of priority in question, but the ground of the grammatical construction remains unaltered. In Mæso-Gothic the comparative termination is *izo* or *ozo*, the superlative *ists* or *ista*; thus the Greek *MEIZON* becomes *MEIZO*, and *MAISTOS* is obviously *MEIGISTOS*. The old *megalos* is *mikils*, mickle or muckle; and *minor*, *minimus*, became *minnizo*, *minnists*; in Persian, *mih* is great, *mihter*, greater, *mihtaras*, greatest; *better* seems to be from the old German *bied* or *bieder*, upright, honest, and resembles the Persian *bihter*, *better*. The Mæso-Gothic verbs have also some striking resemblances in their form to the Latin; thus the present tense of *to have* is *HABA*, *HABAIS*, *HABAITH*; *HABAM*, *HABAITH*, *HABAND*. *HABUIT* is *HABAIDA*; *HABENS*, *HABANDS*; *HABENTIS*, *HABANDIS*; *HABENTEM*, *HABANDAM*; *HABENTES*, *HABANDANS*. The substantive verb singular in Greek is *EIMI*, *EIS*, *ESTI*; the plural in Latin *SUMUS*, *ESTIS*, *SUNT*: the Mæso-Gothic has *IM*, *IS*, *IST*, *SIMJUM*, *SIJUTH*, *SIND*; and *SIS* is *SIJAIS*; *ESSE*, *WISAN*. The Mæso-Gothic nouns frequently retain the resemblance of the Greek more strongly than their more modern derivatives; thus a *TOOTH* does not seem to point very immediately to *DENTEM* or *ODONTA* as its source; but the older form *runthu* is clearly the intermediate stage of this modification; and numberless other instances of the same kind might easily be found.

The Germans were known, as early as the time of Pytheas, that is, 320 B.C., as consisting of the Jutes in Denmark, the Teutones on the coast to the east of them, the Ostiæans next, and lastly the Cossini, Cotini, or Goths. Professor Adelung imagines that the eastern nations, or Suevi, employed almost from the earliest times a high German dialect, and the western, or Cimbri, a low German; the Suevi he supposes to have been driven, at a remote period, into the south of Germany by the Slavonians; and some of the Goths appear to have extended as far as the Crimea. The *Bible* of Ulfila, in the Gothic or Mæso-Gothic of 360, is the oldest specimen in existence of the German language. Besides the Greek and Latin, which appear to prevail so much in the language, it exhibits a considerable mixture of Slavonian and Finnish; the translation is far more literal than it could be made in any of the more modern dialects of the German, and sometimes appears to follow the text with somewhat too much servility.

The modern *German*, founded on the higher dialects of Saxony, was fixed and made general by Martin Luther. There are many shades of dialect and pronunciation in the different parts of this diversified country, but none of them of any particular interest, or established by any literary authority. There are still some German colonies in the territories of Vicenza and Verona, called the *Sette Comuni*, which retain their language. The German Jews have a peculiar jargon, borrowed in some measure from their brethren in Poland, which they write in Hebrew characters; and another similar mixture of discordant dialects is spoken by the Rothwelsch, a vagabond people in the south of Germany, who have sometimes been confounded with the Gipsies.

The *Low Saxon*, or *Platt Deutsch*, is spoken about Halberstadt, and farther north, in the countries between the Elbe and the Weser; it seems to be intimately connected with the Frieslandish and *Dan sh*, as well as with the English. The *Frieslanders* originally extended from the Rhine to the Ems, and the Cauchi, thence to the Elbe; these countries still retain a

dialect materially varying from those of their neighbours. **Language.** The Brokmic laws of the thirteenth century exhibit some remarkable differences from the German of the same date: thus we find in them *Redieva*, a judge, or *Reeve*, instead of *Richter*; *Kenne*, kin; and *sida*, side, as in Swedish, instead of *seite*. The Batavian Frieslandish approaches very much to the English; it has several sub-dialects, as those of *Molkwer* and *Hindelop*. Some of the Cauchi Frieslanders remain in the territory of Bremen; the North Frieslanders occupy Heligoland, Husum, and Amröm.

The *Dutch language* is a mixture of Frieslandish, Low Saxon, and German, with a little French. It appears, from Kolyn's *Chronicle*, to have been distinctly formed as early as 1156.

The Scandinavian branch of the Germanic family is characterized by the want both of gutturals and of aspirates, which renders its pronunciation softer and less harsh; and by some peculiarities of construction, for instance, by the place of the article, which follows its noun, both in *Danish* and *Swedish*, instead of preceding it, as in most other languages. The name of Denmark is first found in the ninth century; until the sixth the people were called Jutes. *Norway*, in the ninth century, was termed *Nordmanland*. A corrupt Norwegian is still, or was lately, spoken in some of the *Orkneys*, which were long subject to Norway and Denmark. In the eastern parts of *Iceland*, the language is much like the Norwegian; but, on the coast, it is mixed with Danish. The oldest specimen of Icelandic is the *Jus Ecclesiasticum* of 1123. The term *Runic* relates to the rectilinear characters cut in wood, which were sometimes used by the Scandinavian nations. The *Swedes* are derived from a mixture of Scandinavians with Goths from Upper Germany, but their language does not exhibit any dialectic differences corresponding to this difference of extraction. Mr Townsend has given us a list, from Peringskiöld, of 670 Swedish words resembling the Greek; but it must be confessed that the resemblance is in many cases extremely slight.

The *Saxons* are mentioned by Ptolemy as a small nation in Holstein, whence, in conjunction with the Frieslanders, and the Angles of South Jutland, they came over to England about the year 450. The Saxons settled principally south of the Thames, the Angles north. At the union of the Heptarchy, the Saxon dialect prevailed, and the English, which nearly resembled the Danish of that time, was less in use; but new swarms of Danes having inundated the north of England in 787, the Danish dialect was introduced by Canute and his followers; and it is about this period that our earliest specimens of the Anglo-Saxon are dated. The Saxon dialect again obtained the ascendancy under Edward the Confessor; and although some French was introduced by this prince, and still more by William the Conqueror, into the higher circles of society, the courts of law, and the schools, yet the use of the French language never became general among the lower classes, and the Saxon recovered much of its currency in the thirteenth century, when the cities and corporate towns rose into importance under Edward the First. In the fourteenth century it was permanently established, with the modifications which it had received from the French; and it may be considered as truly English from this period, or even somewhat earlier, at least if Pope Adrian's rhymes are the genuine production of 1156. It is still much more German than French; in the Lord's Prayer, the only words of Latin origin are *trespass*, *temptation*, and *deliver*. Professor Adelung's remarks on the simplicity of the English language appear to be so judicious as to deserve transcribing: "The language," he observes, "only received its final cultivation at the time of the Reformation, and of the civil disturbances which followed that event; nor did it acquire its last polish till after the Revolution, when the authors who employed it elevated it to that high degree of excellence, of which, from its great copiousness, and the remarkable simplicity of its construction, it was peculiarly capable. It is the most simple of all the European languages; the terminations of its substantives being only changed in the genitive and in the plural, and the alterations of the roots of the verbs not exceeding six or seven. This simplicity depends, in some measure, on a philosophical accuracy, which is carried systematically through the whole language, so that the adjectives, participles, and article, are indeclinable, being in their nature destitute of any idea of gender, case, or number, and the form of a generic distinction

Language. is [almost entirely] confined to objects which are naturally entitled to it. The pronunciation, on the other hand, is extremely intricate; and foreign proper names, in particular, are much mutilated whenever they are adopted by the English."

12. The Celtic family forms a very extensive and very interesting subdivision of the Indo-European class. It has been asserted by some writers, "That the six original European languages, the Iberian, Celtic, Germanic, Thracian, Slavonian, and Finnish, were just as distinct at the beginning of their history as they now are;" but this assertion must be subjected to considerable modification. The thing is in itself so improbable as to require far more evidence than we possess to establish it, even if that evidence were of a more decisive nature; and, in fact, it will actually be found, upon a comparison of the Gothic of Ulphila with the modern dialects, that the Germanic of that day did approach more nearly, both to the Celtic and to the Thracian or Greek, than any of its more modern descendants do. The change of *tunthu* into *tooth*, for which the Germans have *zahn*, has already been noticed; the *atta* and *himina* of Ulphila seem to be more like the Irish *At'air* and *Neamh* than the modern *Vater* and *Himmel* are; and the Mosso-Gothic *vair*, which answers to the Cimbric *FEAR*, a man, is not at present found in German, though its traces may still be observed in the *Firiobarno* of the Franks in 1020: the antiquity of the root is shown by the Celtic names in Cæsar beginning so often with *ver*, and still more strongly by the testimony of Herodotus, that the Scythian called a man *αἰορ*. At the same time, therefore, that we admit the propriety of considering the Celtic and Germanic as families clearly distinct, with respect to any period with which we are historically acquainted, we must not forget that they exhibit undeniable traces of having been more intimately connected with each other, and with their neighbours, in the earlier stages of their existence. The resemblances of the Celtic to the Latin are too numerous to require particular notice, the immediate and extensive connection between these languages being universally admitted; but if any evidence were desired on this subject, it might be obtained in abundance, by a reference to Court de Gebelin's *Monde Primitif*. With respect to the Greek, the terms *Hael*, sun; *Dur*, water; *Deru*, oak; *Garan*, crane; *Crunn*, ice, are among the Celtic words of the most indisputable originality; and their resemblance to *Helios*, *Hüdor*, *Drüs*, *Geranos*, and *Crüoen*, is equally undeniable. We find, also, in the Cimbric, *Bas*, low, connected with *Bathüs*, *Bara*, bread, perhaps with *Bora*, food; *Dayrnas*, kingdom, with *Türannis*; *Dyro*, give, with *Doreue*; *Gogoriant*, glory, perhaps with *Gauriaon*, exulting. With the German it is easy to find a number of very near approaches to identity, even in that Celtic which can be proved, principally from the etymologies of proper names, to be prior to the date of any known or supposed secondary intercourse or mixture of the natives concerned. Thus we have, either accurately or very nearly in the same signification, *Ap*, *Affe*, or *Ape*; *Barra*, *Barre*; *Bleun*, *Blume*; *Bolgan*, *Balge*; *Brig*, *Berg*; *Brogil*, *Brühl*; *Carra*, *Karre*; *Doga*, *Teich*; *Galb*, *Klab*; *Garan*, *Kranich*; *Gnabat*, *Knabe*; *Lancea*, *Lanze*; *Marc*, *Mähre*; *Marga*, *Märgel*; *Redya*, *Reiten*; *Rit* or *Rat*, *Rad*; and *Ur*, *Auer*; and it is impossible to suppose that so numerous a series of coincidences can have been derived from accidental causes only.

The Celts may be imagined to have emigrated from Asia after the Iberians or Cantabrians, and before the Thracians or Pelasgians, settling principally in Gaul, and spreading partly into Italy, under the name of Ausonians and Umbrians. In 570 B.C. they undertook expeditions for the purposes of conquest, but they were subdued by the Romans. Their language was current in Gaul till the sixth or seventh century, when it was superseded by the rustic Roman, which by degrees became French; in Ireland and Scotland it has remained with few alterations; in Wales and Brittany it has been more mixed. The Gauls must have peopled Britain at least as early as 500 B.C. The true ancient Britons are the Highlanders of Scotland only, having been driven northwards by the Cimbri: they still call their language Gaelic. The Irish are probably derived from these Highlanders; they were originally termed Scots or Scuits, that is, fugitives, from the circumstance of their expulsion from Britain; so that, where the Scots are mentioned before the tenth century, as by Porphyry in the

third, we are to understand the Irish. Gildas, in 564, sometimes calls them Scotch and sometimes Irish. After the retreat of the Romans from Britain, a part of them re-entered Scotland about the year 503, and changed its name from Caledonia to Scotia Minor. In 432 St Patrick laid the foundation of the civilization of Ireland; and, in the seventh century, several Irish priests undertook missions to the continent. At the beginning of this century some Scandinavian freebooters had begun to visit Ireland; and in the year 835 they formed large colonies of emigrants, who established themselves firmly in that country, and in the Scottish islands, bringing with them many Gothic words, which became afterwards mixed with the Celtic, and which seem to constitute about one-fifth part of the modern Irish and Gaelic, 140 Gothic words being found under the first six letters of the alphabet only. Some of these Normen remained distinct from the Irish till the year 1102. The oldest specimens of the Irish language, admitted by the continental critics to be authentic, are of the ninth century, though some of our antiquaries have imagined they have discovered records of a much earlier date. The Gaelic of the Isle of Man is mixed with Norwegian, English, and Welsh. A Gaelic-colony formerly established at Walden, in Essex, has been placed by Chamberlayne in Italy, as a nation of *Waldenses*.

The Cimbric or Celto-Germanic language was remarked by Cæsar as differing from the Gallic, although the distinction has not always been sufficiently observed. The Cimbrians seem to have existed as a nation 500 to 600 years B.C.; the Gauls called them Belgæ; they invaded Britain a little before Cæsar's time, and drove the ancient inhabitants into the Highlands and into Ireland. Having called the Saxons to their assistance against the Scots and Piets in the fifth century, they were driven by their new allies into Wales, Cornwall, and Brittany. Their language is remarkable for the frequent changes of the initial letters of its radical words in the formation of cases and numbers; thus, from *Den*, a man, in *Britannish*, is derived the plural *Tud*; from *Vreg*, a woman, *Groages*. Almost half of the Welsh language seems to be German, and half of the remainder is perhaps Latin or Celtic; of the Britannie, about half resembles the Latin or French. Brittany was originally inhabited by the Armoricans; whether they were properly Belgæ or Gauls is uncertain. The country was named Britannia Minor, from the emigration of the British in 449; these new comers mixed with the original inhabitants, all speaking the same language, and in a few years became so numerous as to be able to send an army of 12,000 men to the assistance of the Emperor Anthemius.

Professor Adelung is disposed to consider the German portion of the different branches of the Celtic, which varies from one-fifth to one-half of the whole language, as an accidental mixture, and derived through different channels. But we cannot in all cases find any historical evidence of the existence of these channels; it is difficult, for example, to suppose that the Scandinavian incursions were able at any early period to influence the language of the Highlands of Scotland; and wherever it happens, as it frequently does, that no term is to be found, in the Irish, the Gaelic, or the Welsh, for expressing the same idea, besides the word that they all have in common with the German, it is scarcely possible to believe that there ever was any other Celtic word which has been so uniformly superseded by independent causes. We find, for instance, under the two first letters of the alphabet only, the words *Ap* or *Apa* in Irish, *Ap* in Welsh, *Affe* or *Ape* in Gothic; again, *Abul*, *Aful*, *Appel*; *Angar*, *Aneung*, *Enge*; *Bacail*, *Bach*, *Backen*; *Barrud*, *Barr*, *Bare*; *Beuir*, *Bir*, *Bier*; *Buail*, *Buic*, *Beil*; *Bocan*, *Buck*, *Bock*; *Brathair*, *Bravot*, *Bruder*; *Bul*, *Bula*, *Bulle*; and the same agreement is found in almost all other instances of German words that are detected in the Irish language.

The much-disputed question respecting the antiquity of the poems attributed to Ossian has an immediate reference to the history of the Celtic languages. It has been observed, with apparent justice, by Professor Adelung, who is not in general sceptical on such occasions, that if these poems were really very ancient, their language could not but exhibit marks of antiquity. There is an Irish *Leavre Lecan* at Paris, written in the thirteenth century, and scarcely intelligible to the best Irish scholars of the present day; the oldest Gaelic manu-

Language. scripts have also peculiar expressions no longer in use ; while the works supposed to be the productions of a period so much more remote are found to be in " excellent modern Gaelic, impressed with all the marks of the language of Christianity, and of that of the Norwegian invaders, whether these conquerors may be supposed to have influenced the Gaelic language immediately in Scotland, or by the intervention of Ireland." It must not, however, be forgotten, that these marks of Scandinavian intercourse are somewhat more ambiguous than Professor Adelung is disposed to admit ; and that a book written in the thirteenth century is more likely to have preserved the language in an antiquated form than poems so marvellously committed to memory, from continual recitation only, by people supposed to understand them, and of course imperceptibly modifying the expression without intending to alter them. But since an invasion from Lochlin, that is, Denmark or Norway, is actually mentioned in " *Fingal*," the author of the poem could certainly not have been older than the seventh or eighth century, if we are to credit the historical accounts of these invasions ; and since, in the poems discovered by Dr Matthew Young, St Patrick is introduced discoursing with Ossian respecting the Christian religion, we have an additional argument for denying that he was contemporary with Caracalla or Carausius, these emperors having both lived in the third century, and St Patrick in the fifth.

[It was shown by Dr Prichard that the Kelt tongues were allied to the German, Latin, Greek, Slavonic, and Sanscrit. Did this make them Indo-European? Not without raising the value of the class. How far this is legitimate has never been asked. Yet it ought to be asked wherever an addition is made. Unless it be done, classes take indefinite dimensions. B is connected with A, C with B, D with C, and so on, till classification defeats itself.—R. G. L.]

14. The ETRUSCAN is only known as the immediate parent of the Latin ; but it was written in a character totally different, and was read from right to left. Notwithstanding the industry and ingenuity of Lanzi, the evidence of the accuracy of his interpretations is somewhat imperfect. We should naturally have expected to find more words of a Celtic or Gothic origin, and not merely Greek or Latin words with the terminations a little varied, as *Ustite* for *Ustura*, *Tribo* for *Tribus*, and *Urte* or *Urtia* for *Heorte* ; still less should we have expected that the same sense should be expressed sometimes by a Greek and sometimes by a Latin word, as *Urtu* and *Puni* for Bread, *Capros* and *Feres* for a Boar. The Etrurians and Umbrians were originally a branch of the Celts from Rætia, as is shown by the similarity of the names of places in those countries, as well as by the remains of Etruscan art found in that part of the Tyrol ; they are supposed to have entered Italy through Trent, about the year 1000 B.C., and to have afterwards improved their taste and workmanship under the auspices of Demaratus of Corinth, who settled in Etruria about 660 B.C. (See ETRUSCANS.)

[The philological place of the Etruscan, as well the Lycian and Phrygian, has yet to be determined.—R. G. L.]

15. The LATIN language is placed at the head of a family, rather with regard to the number of its descendants than to the independence of its origin, being too evidently derived from the Celtic, mixed with Greek, to require particular comparison. The first inhabitants of Italy appear to have been Illyrians or Thracians, Cantabrians, Celts, Pelasgians, and Etrurians. Rome, from its situation, would naturally acquire much of the languages of these various nations, and at the same time much of the Greek from the colonies in the south of Italy. In the time of Cicero, the Italian songs, supposed to be about 500 years old, were no longer intelligible, even to those who sang them. We find, in an inscription still more ancient, and approaching to the time of Romulus, *Lases* for *Lares* ; and for *Flores*, *Pleores*, which is somewhat nearer to the Celtic *Bleun*. In the time of Numa, for *Hominem liberum*, we have *Hemonem lœbesom* ; we find, also, a *v* added to the oblique cases, as *Capited* for *Capite*, which, as well as the termination *ai*, in the genitive *aulai*, *pennai*, is taken immediately from the Celtic, and is even found in modern Gaelic.

The Latin remained in perfection but a few centuries. In the middle ages, a number of barbarous words were added to it, principally of Celtic origin, which are found in the glossaries of Dufresne and Charpentier. At the end of the seventh

century it began to acquire the character of Italian, as *Campo* Language. *divisum est* ; and, in the eighth century, in Spain, we find, as an example of its incipient conversion into Spanish, *Vendant sine pecho, de nostras terras*. The formation of the Italian language may be said to have been completed by Dante, in the beginning of the fourteenth century ; and it was still further polished by the classical authors who immediately succeeded him. It contains many German words, derived from the different nations who occupied in succession the northern parts of Italy, and some Arabic, Norman, and Spanish, left by occasional visitors in the south. It is spoken by the common people in very different degrees of purity. Among the northern dialects, that of *Friuli* is mixed with French and with some Slavonian. The *Sicilians*, having been conquered in succession by the Greeks, Carthaginians, Romans, Byzantines, Arabs, Normans, Germans, French, and Spaniards, have retained something of the language of each. *Sardinia* has given shelter to Iberians, Libyans, Tyrrhenes, Greeks, Carthaginians, Romans, Vandals, Byzantines, Goths, Lombards, Franks, Arabs, Pisans, and Aragonians ; and the proper Sardinian language is a mixture of Latin with Greek, French, German, and Castilian. Corsica has also been occupied by a similar diversity of nations ; its peculiar idiom is little known, but the dialect of the upper classes is said to approach nearly to the Tuscan.

Spain, after its complete subjugation by the Romans, enjoyed some centuries of tranquillity. The Vandals and Alans retained their power in Spain but for a short time ; the Suevi, on the N. coast, somewhat longer ; and from these nations the rustic Roman, which had become general in Spain, received some words of German origin. It derived, however, much more from the Arabic during the domination of the Moors, which lasted from the beginning of the eighth century to the end of the fifteenth ; and, at one time, the Arabic was almost universally employed throughout the country, except in the churches. The Spanish language advanced the most rapidly toward perfection during the height of the national prosperity which immediately followed the conquest of America. It was afterwards neglected, and again more particularly cultivated by the Academy of Madrid, in the eighteenth century ; as far at least as an academy can be supposed to have any influence in the modifications of a language.

The Portuguese is supposed to have received a mixture of French from the followers of Count Henry of Burgundy, under whom Portugal first formed a separate state in 1109 ; but the language is very different from that of the confines of France and Spain ; and the nasal vowels, which are remarkable in the Portuguese, differ materially from those of the French, or of any other nation. Many Latin words are retained in the Portuguese which are not found in any other modern language ; and it is remarkable that almost all the words of the language are contracted, by the omission of some of the radical letters of the originals.

The Rætians, in the country of the Grisons, were subdued by the Romans in the time of Augustus. They became part of the Alemannish kingdom, under Theodobert, in 539 ; their union with Switzerland took place in the beginning of the fourteenth century. Half of the Grisons speak the *Romanish* language, immediately derived from the Latin, though mixed with some German, which has been particularly made known by Mr Planta's account of it in the *Philosophical Transactions*. One-third speak German, with some mixture of Romanish words, and the rest a bad Italian.

France in the time of the Romans, was occupied by the Gauls, together with the Aquitanians, who were probably Cantabrians, and the Cimbrians or Belgians. From the rustic Roman, mixed with the languages of these nations, the Romance was gradually formed. In the fifth century, the Franks took possession of the north-eastern part of the country. They retained their language for some centuries, but by degrees it became mixed with the Romance and formed *French*, of which at least one-fifth is supposed to be of German origin, though many of the German words seem to have been admitted through the medium of the Italian. In the S. of France, the language remained more exempt from the influence of the German, under the name of the *Provençal* ; and the troubadours contributed, especially from the eleventh to the thirteenth century, to give it refinement and currency ; but, in later times, the *Langue*

Language. *d'oc* has prevailed over the *Langue d'oc*, which is now spoken by a few of the lowest class only.

The last and least genuine of the descendants of the Latin is the *Wallachian*, about one-half of which is borrowed from the German, Slavonian, and Turkish. The original Thracians of the country must have been in a great measure superseded by the successive settlements of various nations; in the third century, some of the Goths and Vandals; in the fourth, the Jazyges, after Attila's death; in the fifth, some Huns and Alans; about the end of the seventh, the Bulgarians, and afterwards the Petschenegers and Hungarians, established themselves in it; and, in the thirteenth century, Wallachia became an independent state. The Latin part of this language has much of the Italian form, and had even assumed it as early as the fifth century. It must have been derived from Roman colonies, and more lately, perhaps, from the missionaries sent into the country by Pope Gregory XI. The *Dacian* or Hungarian dialect prevails on the N. of the Danube; the *Thracian*, or *Cutzo-Wallachian*, on the S.; the latter is more mixed with Greek and Albanian. There is also a small Wallachian colony in Transylvania.

[For remarks on the Greek, Latin, and German, see below.—R. G. L.]

The *Cantabrian* or *Biscayan* has many words in common with the Latin, whether originally or by adoption, and was probably in some measure connected with the Celtic dialects, which were the immediate predecessors of the Latin, though still sufficiently distinct from them. The Cantabrian *Aita*, Father, has some resemblance to the Irish *At'air*, and the Mæso-Gothic *Atta*; *Geru* is not wholly unlike *Cælum*; *Ereenjaa*, *Regnum*; and *Borondatia*, *Voluntas*; the coincidence of *Gun*, Day, with the Tartarian, is perhaps more accidental. But the word *Lurre*, Earth, which seems at first sight so unlike any other language, is in all probability the derivative of *Tellure*; and this form of the word affords also a connecting link with the Irish *Talu*, and may have been contracted into the more common Latin word *Terra*; a supposition which seems to lessen the probability of the original connection of this form of the word with the Greek *Era*, and the Sanscrit *Stira*. The Biscayan is still spoken in the angles of France and Spain adjoining to the northern extremity of the Pyrenees. The same people were called Cantabrians in the N., and Iberians in the S., and extended between the Pyrenees and the Rhine, as Ligurians, or inhabitants of the coast. They have adopted a few German words, perhaps from the empire of the West Goths; and they have furnished the modern Spanish with more than a hundred original words of their own. The construction of the language is extremely intricate; its verbs have eleven moods, among which are a consuetudinary, a voluntary, a compulsory, and a penitentiary. Larramendi's *Grammar*, published at Salamanca in 1729, is called *El Impossible Vencido*. A valuable abstract of the most interesting particulars relating to the language is found in the *Additions to the Mithridates*, by the Baron William von Humboldt, late Prussian ambassador to the court of Great Britain, printed at Berlin, 1816. Dr. Young has lately remarked, in the *Philosophical Transactions* for 1819, that at least six of the words contained in Humboldt's vocabulary coincide very accurately with the Coptic, or ancient Egyptian, though they are not found in any of the languages of the neighbouring countries; and he infers that the chances are "more than a thousand to one, that, at some very remote period, an Egyptian colony established itself in Spain." It may be observed, that one of these words, *guchi*, little, appears to be also Turkish or Tartarian; so that it becomes a second instance of a coincidence between this language and the Cantabrian.

[The Bask has yet to be placed. It is nearer the Kelt than is generally admitted. At the same time, its African affinities are important. It is an eminently agglutinate language.—R. G. L.]

16. The connection of the Slavonian and Lithuanian, and of the other branches constituting the *SLAVIC* family, with the languages of the Indo-European class in general, is sufficiently established, without exceeding the limits of the Lord's Prayer, by the resemblance of *Nebi* or *Nehesi* to the Cimbric *Nefoedd*, and the Greek *Nephos*; and of *Wolja* and *Chljeb* to the Gothic *Wilja* and *Hlaif*. The Slavonians are the descendants of the ancient Sarmatians, who were situate N. of the Black

Sea and of the Danube. They were conquered by the Goths, and then driven by the Tartars and Huns into the N.E. of Germany, and the neighbouring countries. Procopius calls them *Spori*, and divides them into the *Sclavi* and *Antes*, the latter, perhaps, the same as the Wends. They formed, at an early period, two principal states, Great Russia, about Novogorod, and Little Russia, on the Dnieper, its capital being Kiev. The Russi were a Scandinavian branch, under Rurik, to whom the Slavonians of the former state submitted in 862, whence they were called Russians; and Rurik's successor, Oleg, conquered Kiev. After several vicissitudes, the Russians were liberated by Iwan Wasiliewitch, at the end of the fifteenth century; and this period was the beginning of their greatness. Their language has some mixture of Greek, Finnish, Swedish, Tartarian, and Mongol. The ecclesiastical dialect was uniformly retained in all literary works in the former part of the last century, but now the language of conversation is generally adopted in writing. This language is more immediately derived from that of Great Russia: that of the church, which is called the *Slawenish*, rather from Little Russia, and especially from the dialect of Servia. The *Malo-Russian* dialect is somewhat mixed with the Polish, and is spoken in Ukraine and Little Russia; the *Susdalian* is mixed with Greek and other languages, and is spoken in Thrace.

In 640, the Slavonians took possession of Illyria, which before that time had been overrun by a variety of other nations; and they still retain it, under the names of Servians, Croatians, and Southern Wends. The *Servians* are supposed to have come from Great Servia, now East Gallicia, on the Upper Vistula; the *Croatians*, from Great Chrobatia, probably situated on the Carpathian Mountains. Cyril first adapted the Greek alphabet to the Slavonian language in Pannonia; his letters were afterwards a little altered, and attributed to St Jerome, in order to reconcile the people to their use; and in this form they are termed *Glagolitic* characters. The Servian dialect is intermediate between the Russian and the Croatian. The Bulgarians speak a corrupt Slavonian, which Boscovich, from *Ragusa*, could scarcely understand. The *Uskoks* are a wild race of the Bulgarians, extending into Carniola, and speaking a mixed language. The dialect of Slavonia and Dalmatia is nearly the same as that of Servia and Bosnia; the churches use the ecclesiastical language of Russia. In *Ragusa*, the orthography approaches, in some measure, to the Italian. The Servian is also imperfectly spoken by a small colony in Transylvania. The Southern *Wends* were first distinguished in 630, and were probably so named, like the *Veneti*, from being settled on the shores of the Adriatic, the word *Wend* or *Wand* meaning Sea. They are now mixed with Germans in Carniola, Carinthia, and Lower Stiria. In Hungary there is a small colony, who call themselves *Slowens*, and speak the *Wendish* dialect of the Slavonian. The western Slavonians, or the proper *Sclavi*, write their language in the Roman characters; but the specimens copied from Adelung are accommodated in their orthography to the German mode of pronunciation.

The *Poles* probably came with the Russians from the Danube into the countries abandoned by the Goths; the name *Pole* implies an inhabitant of plains. Their language was partly superseded by the Latin in the tenth century, when they received the rites of the Latin church; but it has in later times been more cultivated. The *Cassubians*, or *Kashubians*, in Pomerania, speak a Polish mixed with a little German. In Silesia, the names of places in the plains are Slavonian; in the hills, more lately occupied, German; but German has been the language of Breslau ever since the year 1300.

The *Bohemians* emigrated with the Moravians and *Slowaks* into their present habitations about the middle of the sixth century, after the destruction of the kingdom of Thuringia by the Franks and Saxons. There is a Bohemian hymn of the date 990, and a chronicle in rhyme of 1310. One-third of the Bohemians are of German origin, and speak a corrupt German.

The *Serbs* or Wends came about the same time into the countries between the Saal and the Oder, from the neighbourhood of the Volga or the Crimea; a few of them are still left in *Lusatia*, under the name of Wends or Slavonians, and some in Misnia. In Pomerania the *Wendish* became extinct about 1400; but the *Polubes* in Lüneburg, on the *Layne* kept up till lately a language consisting of a mixture of *Wendish*

language. and German. The *Sorabic* of the Russian vocabulary seems to be the same with this Servian.

Of the *Lithuanian* or *Lettish* language, two-thirds are Slavonian, the rest is principally German. When the Goths had removed from the Baltic towards the Black Sea, their neighbours the *Æstii* remained for some hundred years independent, till, in the sixth century, the Slavonians incorporated themselves with them, and formed the Lettish people and language. The *Old Prussian* was spoken, at the time of the Reformation, in Samland and its neighbourhood, but it is now lost; it contained more German than the other Lithuanian dialects. The *Prussian Lithuanian* is spoken from the Inster to Memel, especially in Insterburg. The *Polish Lithuanian*, in Samogitia, has a little mixture of Polish. The proper *Lettish* is current in Lettland and Courland; it is purest about Mittau and Riga; the old Courlanders having been Fins, this dialect has received a little Finnish from them. The *Crivingsian* is another dialect, spoken by the Krewins in Courland.

[*Sarmatian* is a convenient term for the Slavonic and Lithuanic collectively. The Sanscrit, instead of being a language of the Indo-European class, with equal affinities to the Greek, Latin, German, and Sarmatian, has a special preponderance of Sarmatian affinities.—A. G. L.]

17. The Tshudish or Finnish, the Hungarian, and the Albanian languages, have some traits of resemblance to each other: they are placed as forming the *sporadic* or scattered order of the great *Tataric* or Asiatic class, being in some measure geographically detached from the rest, and scattered through different parts of Europe: they immediately follow the Indo-European class, as exhibiting an occasional resemblance to some of the languages contained in it, though not enough to make it certain that the connection is essential or original. Thus the Finnish is said to have some coincidences with the Greek, the Laplandish with the Hebrew, the Hungarian with the Finnish, and the Albanian with all its neighbours.

The term *Tshudish* is employed as comprehending the Fins, Laplanders, Esthonians, and Livonians; a race of people of unknown origin, but in all probability unconnected with the Huns or Mongols. Their languages are remarkable for the great complexity of their structure; their nouns, for example, having from ten to fifteen cases, among which are reckoned, in the Finnish, a nuncupative, a conditional accusative, a factitive, a mediative, a descriptive, a penetrative, a locative, a privative, and a negative. The Esthonian has less direct variety of terminations, but several intricate combinations. There is also a great multiplicity of dialects, partly from a mixture of Scandinavian, and partly from other causes; in Lapland almost every church has a peculiar version of the service kept for its use. The *Finnish* is intermediate between the *Laplandish* and the *Esthonian*. The Esthonians are the *Æstii* of the Romans, the name implying Easterly, and being appropriate to the country, and not to the people. The principal dialects of their language are those of Reval and of Dorpat; some authors also consider the dialect of the Krewins in Courland as belonging to it. The *Livonian* is much mixed with other languages, and has been almost superseded by the Lettish. Amongst the Laplandish words which Rudbeck has derived from the Hebrew, we find *Aedhame*, Earth, like the Hebrew *Adameh*. *Hadas*, New; Heb. *Khadesh*. *Hadshe*, the Moon; Heb. *Khadesh*. *Jed*, the Hand; Heb. *Id*. *Ise*, Man; Heb. *Ish*. *Pothi*, Persuaded; Heb. *Pathehh*. *Saedke*, Law; Heb. *Tzedek*: and *Safothi*, Rested; Heb. *Sabbath*. In the Finnish, *Kana* is something like the English and German *Hen*.

18. The *Hungarians* inhabited, in the fourth century, the country of the Bashkirs, between the Tobol, the Volga, and the Jaik, perhaps as colonists, since their name signifies strangers. Their language was spoken in this neighbourhood as late as the thirteenth century; in the sixth they were conquered by some of their Turkish neighbours; in the end of the ninth they were forced by the Petschenegs, a Tartarian nation, to remove nearer to the Carpathian Mountains. They were then engaged in the German wars, and their country having been occupied during their absence by the Bulgarians, they took possession of the Bulgarian kingdom on the Theiss, as well as of Pannonia. Their language is somewhat like the Finnish, but the people are very different from the Fins in appearance; which might indeed be the effect of a difference of climate; but, in fact, the language appears to be still more

like the Slavonian with a mixture of a multitude of others; Language. it has some words from various Tartarian dialects, German, French, Latin, Armenian, Hebrew, Persian, and Arabic; but it has no traces of the Mongol, nor is it possible that the people can be descendants of the Huns, whose character and cast of features can never be eradicated. The word *Coach*, so general in Europe, is originally Hungarian, having been derived from the town of *Kots*, where coaches are said to have been invented. The Szecklers, in Transylvania, speak a language like the Hungarian; it is uncertain whether they are a Hungarian colony, or remains of the Petschenegs; but, however this may be, there is little doubt that the Hungarians are principally of Tartarian extraction, though much mixed with other nations.

19. The *Albanians* speak a language, of which a considerable portion is Greek, Latin, German, Slavonian, or Turkish; but the rest seems to be perfectly distinct from any other language with which we are acquainted. They are probably connected with the Albanians between Mount Caucasus and the River Cyrus, who are supposed to be derived from the Alani; some of them seem to have entered Bulgaria as late as 1308. In 1461 many of them fled from the Turks to *Italy* and *Sicily*, where they still exist near Reggio and Messina. The Clementines are an Albanian colony, who followed the Austrian army in 1737; such of them as escaped from the pursuit of the Turks established themselves in Syrmia.

[The Albanian is less, the Hungarian more, Finn than the text makes them.

The ordinary term at present in use for the name of the class is *Ugrian*.

It is chiefly in the southern part of the area that the Ugrian languages are sporadic. The Hungarian has intruded into Hungary; the Russian into the governments of Permian, Viatka, Kazan, Simbirsk, and Saratov, &c., all of which were originally Ugrian. The Lap, Esthonian, Finn of Finland, &c., are all continuous.

The so-called Indo-European tongue nearest to the Finn is the Lithuanic.

The Livonians (*Liven*) are a small population of *Courland*, originally spread over *Livonia*, or *Liefland*, to which they gave the name.

The locality of the *Æstii* was the amber-country of East Prussia, not Esthonia.—A. G. L.]

20. The languages referred to the *Caucasian* order have little to distinguish them from the rest of the class, except their geographical situation, in the immediate neighbourhood of the Caucasian Mountains. They have a general resemblance to some others of the languages of Northern Asia, and particularly to the Samojedic dialects, spoken on the mountains between Siberia and the Mongols. Except the Armenian and Georgian, they are scarcely ever employed in writing; and principally, perhaps, from this cause, they exhibit as great a diversity, in the space of a few square miles, as those of many other nations do in as many thousands. It is only conjectured that most of the inhabitants of these countries are derived from the miscellaneous fragments of expeditions of various nations, left behind in their passage through them at different periods.

[The use of the term Caucasian in ethnological physiology (the *Caucasian* race of Blumenbach, containing Arabs, Jews, Europeans, &c.) as a class-name for a heterogeneous group of families, engenders ambiguities. The present writer has suggested the name *Dioscurian*; *Dioscurias* being the name of a town of Caucasus, not only mentioned by ancient writers, but mentioned with reference to the remarkable multiplicity of languages and dialects spoken in its neighbourhood—this being a notable characteristic of modern Caucasus.

The *Dioscurian* class he arranges as follows:—

1. Circassian or Tsherkess, falling into the Abassian, Tsherkess, and Kabardinian divisions.
2. The Lesgian, falling into—
 - a. The Tshetsh (Kistic)—the Tshetshents, Ingush, and Tushi; and
 - b. The Lesgian Proper—the Avar, Dido, &c.
3. The Georgian—Suanic, Imiretian, Mingrelian, Lazic, and Kartulinian dialects.
4. The Armenian—ancient and modern.
5. The Iron, or Osset, leading to the Persian, and containing numerous Indo-European words.

Language. The nearest affinities of the most northern and most characteristic of the Caucasian dialects, the Circassian, are with the Tibetan, and the western monosyllabic tongues. It is only because the comparison has been most carefully made with the Samoyed, that they seem to be more akin to that family than to others. They have miscellaneous affinities with all the Turanean languages. There is no reason to believe that any of them are other than aboriginal to the soil.—R. G. L.]

The connection of the *Armenian* with the Sanscrit and the Persian is just enough to make it equally possible that the coincidences may have been derived from a common parent, or that one language may have simply borrowed detached words from the other. We find, in different parts of Mr Townsend's work, about ten Armenian words resembling some other language; these are—*Air*, a Man; Irish *Air*. *Atamn*, a Tooth; Greek *Odonta*. *Chuerk*, Four; Sanscrit *Chatur*. *Dor*, a Door. *E*, Is; Latin *Est*. *Es*, I; Russian *Iaze*. *Gas*, a Goose; German *Gans*. *Houze*, a House. *Lakeil*, to Lick; Greek *Leichein*; and *Sirt*, the Heart. Nothing is known of the history of the Armenian before the time of Miesrob, who translated the Bible into it in 405: the historian Moses, of Chorene, was his pupil. The language flourished till the year 800, and is still preserved in tolerable purity in the cloisters. The common people speak a dialect more corrupt and mixed. The fathers of the Armenian convent at Venice have been very laudably employed in the improvement of the literature of their nation by the publication of several very elegant editions of Armenian books, which have been executed at their press; in particular, of an Armenian translation of Eusebius, containing some passages which are not extant in Greek, and said to have been copied from a manuscript of great antiquity at Constantinople. It is, however, very remarkable, that, as they candidly confess, the copy, when first received by them, contained the corrections and additions of Scaliger, in conformity with the text of the printed Greek edition; and the copyist, when questioned, asserted that he had merely translated, and inserted passages of his own accord, and in silence, in order to make the work more perfect. Still the Armenian Eusebius is a very handsome book, and every way calculated to do credit to the Venetian editors and their patrons; a Latin translation of it only has been published by Angelo Mai at Milan.

[The persons of the verb, and the numerals are the points in which the Armenian most agrees with the so-called Indo-European languages; but these are just the points in which numerous languages, never considered Indo-European, also agree. The glossarial affinities are most with the Iron (Osset), and Persian. It graduates through these into the other allied groups. Nevertheless, many authorities make it absolutely Indo-European.—R. G. L.]

21. The *Georgians* are supposed to have derived their name from the River Cyrus or Gur, and to have extended formerly to Colchis, under the denomination of Iberians. Moses of Chorene, in the fifth century, mentions the Georgian translation of the Bible. The old language is still preserved in the churches, and the common dialect of the country is derived from it, together with the *Kartvelish*, *Imirettish*, *Mingrelish*, and *Suanetish*, which are varieties of that dialect; the *Tushetish* is mixed with some Kistic. The Georgians have no fewer than thirty-seven letters, and among them a variety of aspirates and sibilants, of no very agreeable sounds.

[To the Georgian dialects of the text, add the *Lazic* of the Mohammedans of the parts between Batoum, Kars, and Trebizond. Subtract the *Tushi* (*Tushetish*) which is *Tshetsh*. The *Kartulinian* is the most cultivated, the *Suanic* the rudest, of the Georgian forms of speech.—R. G. L.]

22. The *Abassic* nations seem to be the oldest inhabitants of the Caucasian country. 23. The *Circassians* are situate to the E. of them, on the promontory of North Caucasus. 24. The *Ossetes*, on the left of the Terek, N. of the mountain; the dialect of the *Dugors* is scarcely distinguishable from this. 25. The *Kistric*, spoken by the *Ingushans*, and their neighbours at the head of the Terek, is connected with the *Tushetic* Georgian. 26. The *Lesgiens*, E. of Caucasus, on the Caspian Sea, have a number of distinct dialects, or rather languages. Thus, the *Chunsag* and *Avaric*, the *Dido*, the *Kasi Kumik*, the *Andi*, and the *Akushan*, have little connection with each other, except that the *Dido* somewhat resembles the *Chunsag*, of which the *Avaric*, the *Anteug*, and the *Dzhar*, seem to be

subordinate dialects. The *Kasi Kumik* appears to have adopted some words of the Armenian, and the *Andi* and *Akushan* of the Georgian. The dialect of *Kubesha* resembles that of *Akusha*, and retains no traces of a supposed European origin.

[The *Abassic* is Circassian; the Circassian forms of speech being the most monosyllabic and uninflected of Caucasus—also most like the Tibetan.

The *Osset* (or *Iron*) is the most like the Persian, and has by many been considered Indo-European. But the Georgian is connected with it. What do we infer from this? That the Georgian also is Indo-European, or that the *Osset* is not so? The former is the inference of learned men with whom the present writer (who holds the latter view) reluctantly differs.—R. G. L.]

27. The languages of the central and elevated parts of Asia are comprehended in the order *Tartarian*; they extend from the Caspian Sea to the mouth of the Amur, through countries which have been in former ages the constant scenes of emigration and barbarism. The *Turco-Tartarians* are supposed to correspond to the descendants of the Magog of the Scriptures, and to some of the Scythians of the Greeks. The Turks of Turkestan seem to have been the Massagetæ and Chorasmi of the ancients; their country extended N. of Persia and Thibet, from the Caspian to the Altaic Mountains. In the twelfth century they were brilliant and victorious; at present, a few of their descendants only are left in the neighbourhood of the Mongols, and their language is no longer spoken; the Turcomans scattered in Persia and Arabia are derived from the same race. The Osmans, now commonly called Turks, left Turkestan in 545, and succeeded in the conquest of Persia. They were denominated Osmans, from one of their leaders, in the fourteenth century. Their language has been much mixed with Arabic and Persian. This language, with the neighbouring dialects, has been considered in the table as belonging to a family called *Caspian*, the word *Tartarian* having been previously applied to the whole order. Several of these dialects exhibit a mixture of words from the language of the Mongols, which, as well as the Calmuck, has a sufficient connection with them to be arranged as belonging to the same Turco-Tartarian family. It would, perhaps, be equally correct to consider some of them rather as distinct languages than as dialects of a single one; but it is not easy to discriminate those which are entitled to this rank; and, on the other hand, some specimens have been admitted, from the Comparative Vocabularies, which scarcely deserved to be noticed as separate dialects. The *Bucharians* are situate between the Oxus and Jaxartes, on the River Koly. They still retain some traces of a superior degree of civilization, by which they were once distinguished. Their language is little known, but it seems to be at least as much connected with the Median and Arabian families as with the Caspian. The Tartars were described by the terms *Scythians*, *Bulgarians*, *Avari*, and other appellations, before they were conquered and united by Genghiz Khan the Mongol. In the year 1552 they became subject to the Russians. The most westerly are the *Nogaic* or *Nagaic* and *Crimean Tartars*; their language is much like the Turkish, but mixed with some Mongol. Those of *Cumania* in Hungary have now forgotten their original language, and speak the Hungarian, the last person who understood the Cumanian having died in 1770. They entered Hungary in 1086, and became Christians in 1410. The *Tartarian*, or rather *Caspian*, is spoken in great purity about *Kasan*; a dialect somewhat different in *Orenburg*; and another by the *Kirghishes*, who occupy part of the ancient Turkestan. "Among the Siberian Tartars, the remains of the kingdom of Turan, some are Mohammedans; others, as the *Turalin* villagers, have been made Christians; at least the Archbishop Philophei performed the ceremony of baptizing them, by ordering his dragoons to drive them in a body into the river." The inhabitants of the banks of the *Tara*, a branch of the Irish, are said to be derived from the *Bucharians*. The *Tshulimic* Tartars enjoy the same advantage as the *Turalin*, and are considered as Christians by the Russians. The *Teloutan*, in Sonjor, are heathens, nearly like the *Shamanites* of India. The *Jakuts* extend along the *Lena* to the sea; their language contains some *Mantshuric* and some *Tungusic*. That of the *Tshuwashes*, on the *Volga*, is said to have been once completely distinct from the *Tartarian* or *Caspian*; and even at present,

Language. though more mixed with it, may require to be classed as forming a separate species.

The *Mongols* are marked by their features as a race very different from the other Tartars; the character of their countenance seems to be easily propagated from father to son, and never to be completely effaced; their original habitation appears to have been in the neighbourhood of the Altaic Mountains. The description of the Huns, found in Ammianus, Procopius, and others, agrees exactly with the present Mongols, whom the Chinese still call *K'iong nu*; and more particularly with the Calmucks. The proper names of the Huns are also found to be explicable from the Mongol language. In the first century they were driven westwards by the Chinese: under Attila they penetrated into the middle of Europe; and they were little less successful at subsequent periods, under Genghiz Khan and Timur Leng. When they were expelled from China, after having held it in subjection for more than a century, they carried back no civilization with them; nor was either of the languages permanently affected by this temporary mixture of the nations, although the physiognomy of the Chinese bears ample testimony of its having once existed. The construction of their language seems to be very indirect and figurative. Mr Townsend has copied from General Vallancy a long list of words, in Strahlenberg's *Mongol Vocabulary*, which agree very remarkably with the Irish; among these we find *Are* and *Ere*, man; Irish *Ar*, *Air*, Fear. *Arul*, a spindle; Irish *Oirle*. *Alemamodo*, an apple-tree; Irish *Amhalmhaide*. *Asoc*, to ask; Irish *Ascadh*. *Baiehu*, I live long; Irish *Baoth*, long life. *Bugu*, a buck; Irish *Boc*, a he-goat. *Choy*, a ewe; Irish *Choi*; and *Choraga*, a lamb; Irish *Caorag*; without going any further in the alphabet. The last two instances are very striking, and seem to point very strongly at that part of the East from which the Celts may be supposed to have originally emigrated. The *Calmuck* dialect is somewhat mixed with the neighbouring Tartarian. The Tagurians, or Daurians, between the Lake Baikal and the Mongol Hills, are said to be of Mantshuric origin; but their language evidently resembles the Calmuck. The *Burattish* is from the Russian vocabularies.

28. The *Mantshurians* are sometimes improperly called Eastern Mongols; they are subjects of the empire of China. Their language is rude, and not much like the Chinese, though evidently derived from the monosyllabic class. It has some few words in common with the European languages, as *Kiri*, patient; *Kirre*, German; *Cicour*, Latin, tame. *Furu*, *Furor*. *Lapta*, rags; *Lappen*, German. *Sengui*, blood, *Sanguis*; *Ania*, a year, *Annus*; but, considering the remoteness of their situation, we can scarcely form any conclusion from the occurrence of these resemblances. M. Abel Rémusat held the appointment of professor of this language at Paris; but it was found difficult for him to render its study very popular in the midst of so busy a metropolis. Whether the language of the island of *Sagalien*, opposite to the mouth of the Amur, is a dialect of the Mantshuric, or totally distinct, and requiring to be classed with the insular languages, appears to be not yet sufficiently ascertained. The *Corean* has been supposed to be a mixture of Mantshuric and Chinese: the Coreans do not understand either of those languages when they are spoken, but this fact is perfectly compatible with the supposition.

29. The *Tungusians*, in the E. of Siberia, subject to the Chinese, speak a peculiar language, mixed with some Mongol. The Russian vocabularies contain specimens of a variety of their dialects, besides those of the Tshapogirs, on the Jenisei; and the Lamuti, on the Sea of Ochotsk, none of them particularly interesting or remarkable.

[The Bucharian Proper is Persian; the Uzbek of the dominant stock only being Turk.

The Tshuwash is as often considered Ugrian as Turk.

The Huns are quite (if not more) likely to have been Turks than Mongolians.

The present classification of the languages allied to the Turk is as follows:—

The *Turanian*, or *Scythic* stock contains the (1.) Mongolian, (2.) Turk (Tartarian), (3.) Tungus, and (4.) Ugrian branches.

The Manchu is a section of the Tungus branch. The Corean belongs to a different division.—R. G. L.]

30. The languages belonging to the *Siberian* order occupy the principal part of the N. of Asia, between the mountainous Tartarian territory and the Frozen Sea. At the commence-

ment of this order, we find a variety of inconsiderable nations Language. in the neighbourhood of the confines of Europe and Asia, which have their distinct languages, probably formed, in times comparatively modern, out of the fragments of others. They have almost all of them some Finnish words, but none a sufficient number to justify us in considering them as dialects of the Finnish language, although the people were very probably connected with the Fins as neighbours, in the middle ages, on the banks of the Dwina and elsewhere. The *Sirjanes*, in the government of Archangel, speak nearly the same language with the *Permians*, who are partly in the same government, and partly in that of Kasan. The *Wotiaks*, on the Wiatka, also in Kasan, have a dialect which seems to be intermediate between the Permian and the Tsheremissic. 31. The *Woguls*, situate on the Kama and the Irtish, afford specimens of several dialects in the Russian collection; they seem to have borrowed a few words from the Hungarian, and much more from the language of the *Ostiaks* (32), who are also divided into several races. 33. The *Tsheremisses*, situate on the Volga, in Kasan, have a little mixture of Turco-Tartarian. 34. The *Morduins*, on the Oka and Volga, have about one-eighth of their language Finnish, and also some Turco-Tartarian words. The *Mantshuric* is a dialect differing but slightly from the Morduin. 35. The *Teptjerai* are people paying no taxes, who originated from the relics of the Tartaro-Kasanic kingdom in the sixteenth century, and who are said to speak a language peculiar to themselves. The arrangement of all these dialects must remain very imperfect, for want of a greater number of specimens of their peculiarities.

36. The *Samojedic* nations are situate N. of the Tartars, by whom they may possibly have been driven into their present habitations. Their languages seem to have some affinity with the Caucasian and Lesgian dialects, and some of them with the Wogulic and Ostiak families; the specimens in the Comparative Vocabularies seem to have been multiplied somewhat too liberally. 37. The *Camashes* are situate on the right of the Jenisei; they are Shamanites or Buddhists; their language seems to be a mixture of several others, and is divided into several very distinct dialects. The *Koibals* have been baptized; they have borrowed some words from the Turco-Tartarian family. The *Motors* are situate on the Tuba. 38. The *Ostiaks* on the River Jenisei afford us five specimens of languages totally different from those of the *Ostiaks* already mentioned, but nearly connected with each other, so that they may properly be called *Jenisei-Ostiaks*. 39. The *Jukagirs*, or *Jukadshirs*, are few in number; they are situate between the Jakuti and the Tshutshi; they have some Jakutish words mixed with their language, and some Tsheremissic.

[The Teptyar are Turk rather than Ugrian.

All the other populations of this section are Finn or Ugrian, viz., Sirianian, Permian, Morduin, Samoyed, &c. The term Siberian is not used in the sense of the text.—R. G. L.]

40. The *Koriaks* and the *Tshutshi* occupy the north-eastern-most point of Siberia; the proper Koriak is spoken on the Bay of Penshin; the *Kolymic* on the River Kolyma, the *Tigilic* on the Tigil, in Kamtschatka; and the *Karaginic* on the island Karaga: the Tshutshic has been considered as a dialect of the Koriak. 41. The *Kamtschatkans* are a little farther S.; the *Tigilic Kamtschatkan* is found, however, on the N. of the Tigil; the *Srednish* to the W., on the Bolshaia, and the *Jashnyshic* on the River Kamtschatka, and towards the South Cape. The languages of the neighbouring parts of America, according to Professor Vater, greatly resemble the Tshutshic.

The *Insular* order of the Tataric or Atactic class of languages must be understood as comprehending all the Asiatic islands E. of Borneo. 42. The language of the *Curilees* is spoken not only in the principal of these islands, but also in Kamtschatka, about Cape Lopatka; but in some of the islands the Japanese is spoken. The *Japanese* derive themselves from the Chinese, but their language contradicts this opinion; they have evident traces of Mongol extraction or relationship. The amiable islanders of *Loochoo* will long be remembered by the British public, for the hospitality they showed to the Alceste and the Lyra; their language appears to be related to the Japanese, as might be expected from their situation.

[In the opinion of the present writer, the Koriak (to which the Kamskadale belongs), the Curile, the Japanese, and the Corean, constitute a class, for which he recommends the name

Language. *Peninsular*, transitional to the Ugrian tongues on the one hand, and the American on the other.—R. G. L.]

Formosa was conquered by the Dutch in 1620, but in 1661 it was taken from them by a Chinese pirate: the next year some books were printed in the Formosan language in Holland, the recapture of the island not being yet known there; in 1682, it was finally given up to the Chinese government. 47. The *Moluccan* is considered by Dr Leyden as an original language; that of Magindanao contains some Malayan, Moluccan, Tagalish, and Bugis. The *Tagalish*, or *Gala*, is the principal language of the *Philippines*, and almost as generally understood in that neighbourhood as the Malay and Hindustanee in other parts; it is allied to the Malayan and to the Javanese, and was probably derived in great measure from these languages; it also resembles in some measure the Bugis. The *Bissayish* is a ruder dialect of the Tagalish. The *Sulu* differs but little from these dialects, being derived from the same sources. The *Bugis* is the language of Celebes; it is supposed to be more ancient than the Javanese; it seems to contain no Sanscrit, but much Malay, Tagalish, and Javanese, and some of the old Ternate, or Moluccan; it is written in a peculiar character, and some good poetry is found in it. There is a dialect called the *Mungharar*. The *Bima* somewhat resembles this dialect; it is spoken in the eastern parts of Sumbawa, and the western of Endé or Flores; it is written either in the Bugis or the Malay character; it seems to have a distant resemblance to the language of Orissa. The dialect of *Sumbawa* exhibits some slight variations. A few single words, as *Matta*, the eye, and *Matte*, death, are found to coincide in almost all the islands of the *Pacific Ocean*; the languages of which, notwithstanding their immense distances, seem to differ less than those of the inhabitants of some very small continental tracts; and they might probably be divided into a few well-defined families, if our knowledge of them were more complete. The resemblance of *Matta* to the Arabian *Mot*, and the Latin *Mactare*, is probably accidental.

[All these languages are Malay.—R. G. L.]

The number of the *AFRICAN* languages is supposed to amount to one hundred or one hundred and fifty, and as many as seventy or eighty of them have been distinguished with tolerable accuracy. The population of Africa seems to have been derived from Arabia, and, as some critics think, rather from the southern than from the northern part; a great number of its present inhabitants are negroes, but these cannot be distinguished from the rest by any infallible criterion. The account given by Ptolemy of the interior part of the country appears to be wonderfully accurate and extensive; although some of his measures seem to be erroneous, and not sufficiently reconcilable with the truth, even by adopting Major Rennell's hypothesis respecting them. It is, however, remarkable that Ptolemy followed Hipparchus in extending the eastern coast of Africa to the Ganges, although more correct ideas of its form had been entertained at Alexandria before his time.

The *Egyptians* demand the priority in treating of the inhabitants of Africa, from their early connection with ancient history, both sacred and profane. It is observable that the representations of the old Egyptians have countenances more or less approaching to the negro physiognomy, though the dry bones of the skeleton have that character somewhat less decidedly than they must have had when clothed with the thick lips and flattish noses of the generality of the representations; at the same time there are sculptures of great antiquity, which exhibit features not unlike those of correct Grecian or Roman beauty; and others have a considerable resemblance to the Arabian nation. At present the people of middle Africa in general are more or less like negroes, but they are somewhat less dark, and their noses and lips are less peculiar; the women sometimes screamed if Burckhardt made his appearance on a sudden, and called him the devil, because he was white. The Egyptians are supposed by some writers to have received their civilization from Ethiopia; but there are at present no traces of the remains of high civilization farther S. than Nubia, except a few scattered monuments about Axum, of no great antiquity. The Egyptians were at first called Copts by the Saracens, and their language has been commonly distinguished by the appellation *Coptic*, that is, as written in characters which are principally Greek, and frequently intermixed with a number of pure Greek words; but not a single frag-

ment of Coptic has yet been discovered in this form that is Language. earlier than the establishment of Christianity in Egypt; and it seems probable that the character was introduced by the early Christians at the time of the translation of the Scriptures into Coptic, which is certainly of very high antiquity. The Greek authors frequently mention an Egyptian alphabet of twenty-five letters; but no traces of any such alphabet are found in the multitudinous inscriptions or manuscripts that have been preserved by the exertions of the numerous and adventurous travellers who have lately visited the country. The Greek words mixed with the Coptic are not considered by the grammarians as incorporated with the language, nor are they admitted into the dictionaries. The genuine language bears very evident marks of great antiquity; its construction is simple, and often awkward, and a great number of its words are monosyllables. We have positive evidence of its having remained unaltered from the time of Herodotus, Plutarch, and other Greek authors; and it affords us the etymology of the name of Moses, and of some other words mentioned in the Scriptures. It exhibits a few coincidences with other ancient languages, but not enough to enable us to consider it either as the offspring or the parent of any of them, except that it gives us something like an explanation of the meaning of some of the Greek particles. Out of one hundred and fourteen original Egyptian words, there are fifty-two that resemble the Greek, twenty-seven the German and English, eighteen the Hebrew, three the Syriac, two the Arabic, two the Sanscrit, one the Slavonian, and one the Cantabrian. It is, however, probable, that a person more intimately acquainted with the languages of the Arabian family would have been able to find a much greater number of coincidences, since nations which had so much intercourse as the Jews and the Egyptians could scarcely fail to have many words in common, even if their languages had been at first completely different; and probably many of the Arabic roots, which are not Hebrew, may be found in the Egyptian. To the Cantabrian word inserted in this enumeration Dr Young added five others, the whole six being—*Berria*, new; *Ora*, a dog; *Guchí*, little; *Oguia*, bread; “*Otsoa*,” a wolf—whence the Spanish *Onza*; and *Shashpi*, seven. In Coptic, *Beri*, new; *Uhor*, a dog; *Kudshi*, little; *Oik*, bread; *Uonsh*, a wolf; and *Shashf*, seven. Hence he infers, that “if we consider these words as sufficiently identical to admit of our calculating upon them, the chances will be more than a thousand to one that, at some very remote period, an Egyptian colony established itself in Spain; for none of the languages of the neighbouring nations retain any traces of having been the medium through which these words have been conveyed. On the other hand,” he continues, “if we adopted the opinions of a late learned antiquary, General Vallancy, the probability would be still incomparably greater that Ireland was originally peopled from the same mother country, since he has collected more than one hundred words which are certainly Egyptian, and which he considers as bearing the same sense in Irish; but the relation, which he has magnified into identity, appears in general to be that of a very faint resemblance; and this is precisely an instance of a case in which it would be deceiving ourselves to attempt to reduce the matter to a calculation.” It may, indeed, be imagined that the Egyptian dominions may formerly have extended to the Straits of Gibraltar, and that Spain may have derived a part of its population from this part of Africa, which approaches so near to it; but it could scarcely have happened that no traces of Egyptian monuments should ever have been found at any distance from the Nile, if that active people had really occupied any considerable portion of the neighbouring continent. The word *Chemistry*, in Greek *Chemía*, is well known to be derived from the Egyptian; it has successively been compared, by the Quarterly Reviewer, to *Chim* or *Chem*, heat, and to *Chem*, secret; the latter being the more probable origin of the two; and a third etymon might be found, if it were required, in the *Dshem*, or *Ghem*, to find, or invention. The Coptic language has been nearly extinct for about two centuries; but the service has been read in Coptic much more lately in some of the churches, though it has now been almost entirely superseded by the Arabic. The proper Coptic, or Memphitic, which was the dialect of Lower Egypt, is supposed, from a word quoted by Herodotus, to be the most ancient; the Sahidic or Thebaic of Upper Egypt was probably

Language. preserved for a longer time, especially in some of the monasteries; there is a separate version of the principal part of the *Bible* in this dialect, fragments of which have been published by Mingarelli and Woide; a third dialect, much resembling the Thebaic, is commonly called the Bashmuric; and a fourth, the Oasitic, has been partially made known by M. Quatremère de Quincy. The Egyptians have left no traces of their language among the people who at present occupy the countries that they inhabited; the Nubian vocabularies collected by Burckhardt contain no Coptic words; the people are of different Arab races, but have acquired peculiar dialects, probably mixed with those of the neighbouring negro nations, of several of which we find specimens in Mr Salt's *Voyage to Abyssinia*. [The Coptic is an eminently agglutinate language.

As far as the hieroglyphics have been deciphered, the language given by even the earliest is Coptic.

Syllable for syllable, *Copt* = *E-gypt*.

The *Barabra* is a Nubian dialect.

The nearest affinities of the Coptic are those that geography suggests, viz., the Semitic, and the other Sub-Semitic forms of speech.—*R. G. L.*]

But one of the most learned, as well as the most adventurous and industrious, of modern travellers, has remarked some coincidences between the old Egyptian language and that of the *Barabras*, who are neighbours of the Nubians, and extend to the confluence of the Tacazze and the Nile. The Geez and Amharic have already been mentioned as descendants of the Arabian family; they seem to have introduced some traces of this extraction into several of the neighbouring dialects, probably by the translations of the Scriptures, or by the use of the Koran. Professor Vater has taken some pains to prove that the language of Amhara, the Camara of Agatharchides, is wholly independent of the Ethiopic and Arabian; but in this he appears to be mistaken. It exhibits some slight resemblance to the Sanscrit, in a few instances; thus *Tshegure* is hair, in Sanscrit *Sshicoura*. Macrizi tells us that there are, in the whole, fifty Abyssinian dialects; but he has probably exaggerated their number. We have obtained more authentic information respecting them from the collections of Bruce, and of his editor, Murray, and still more lately from Dr Seetzen and Mr Salt. Of the Mek of Dongola, the representative of a long race of the Christian kings of Nubia, little is now known, except that he is in a great measure dependent on the king of Sennaar on the one hand, and has been expelled from a part of his territories by the Mamelukes on the other. Of the Agows and the Gafats, neighbours of the Abyssinians, and situate on the Bahr el Azrek, as well as the Jewish Falashas, who are scattered over the country, especially in Dembea, we have read much in the historical romances of Mr Bruce, which certainly give a faithful picture of the countries to which they relate, notwithstanding some unaccountable inaccuracies with respect to the personal adventures of the author.

The N. of Africa is occupied by inhabitants not much differing in appearance from the Arabs. Its three principal divisions are—the coast, the country of wild beasts, and the desert. The later Arabs have expelled the earlier Africans from the first division, and partly from the second; the Berbers occupy the third, inhabiting principally the *oases*, or cultivable islands, scattered through the desert from Mount Atlas to Egypt, and speaking, as Horneman first ascertained, the same language throughout its vast extent. They were first well described by Leo Africanus: they are probably the remains of the Mauritians, Numidians, Gætulians, and Garamatians. There is no foundation whatever for the opinion of some modern authors of celebrity, that their language is derived from the Punic. We even find, from Sallust, that the Numidian language differed from the Carthaginian; and from Valerius Maximus, that it was written in a peculiar character, perhaps the same with that which is found in the inscriptions from Lebeda, now in the court of the British Museum. The language of the *Canaries* considerably resembles the Berber; thus, milk is *Acho* in Berber, and *Aho* in the *Canaries*. These islands were discovered in 1330, and afterwards conquered, with some difficulty, by the Spaniards. The inhabitants were a fine race of men, and lived in comfort and tranquillity: and they still present some traces of their original character and condition.

[The Gafat are Semitic; the Agows and Falasha Sub-Semitic. So are the Berber, or Amazingh tongues.

The Dongola forms of speech are Nubian. *Barabra* (dif-ferent from *Berber*) and Nubian are nearly synonymous — *R. G. L.*]

The country between the desert Zahara and the Niger is inhabited by a race of people who have a great resemblance to negroes, but are somewhat different from them. In the E. are those of *Soudan* or *Afmu*, and *Begermah*; in the W. the *Foulahs*; the *Fellatas* are a branch of these, extending considerably to the N.E., with a mixture of negroes.

Of the languages of the negroes, strictly so called, many interesting specimens have been collected by the zeal of the evangelical missionaries in the Caribbee Islands, and published by Oldendorp, in his *Account of the Mission*; but they do not afford us sufficient materials to enable us to trace any extensive connections or dependencies among their multifarious dialects.

There are some points of coincidence between the language of *Madagascar* and those of the Malays, the Philippine islanders, the *Beetjuana* Caffres, and the *Corana* Hottentots: there are also a few words, in many of the African dialects, borrowed from the modern Arabic, not, as Court de Gebelin would persuade us, from the Phœnician. Nor can any other of the affinities be very distinctly established.

The *Caffres* have little of the negro character except the black colour, and less of this as they become more remote from the equator. They are supposed to extend across the whole of Africa, immediately N. of the Hottentots, as far as Benguela and Quiloa. The *Hottentots*, with their neighbours the *Bosjemen*, speak different dialects of the same singular language, in different parts of their country. Of that of the *Dammaras*, little or nothing is known. Lichtenstein has classed them as Hottentots; but Barrow, who was better acquainted with them, considers them as Caffres.

[For a fuller sketch of the African languages in general, see below; here observing that—

a. The Malagasi of Madagascar is Malay.

b. There are two different populations known as *Dammaras*, one of which is Caffre, one Hottentot.—*R. G. L.*]

ADDENDA.

On the Languages of Armenia.

The *ESKIMO*.—The extent to which this language is isolate has been greatly exaggerated. It has decided and direct affinities with the north-eastern Ugrian and the Peninsular languages on one side, and the north-western languages of America on the other.

It is spoken in Greenland, Labrador, the coast of the Arctic Ocean, Russian America, the Aleutian Isles, and the parts about Tshuktsh-Noss in Asia.

It is succeeded by the languages of,—

The *ATHABASKAN GROUP*.—The vast size of the area over which the Athabaskan tongues have spread themselves has commanded less attention than it deserves. It should command attention if it were only for the fact of its touching both the oceans—the Atlantic on the one side, the Pacific on the other.

For the northern Athabaskans, the main body of the family, the philological details were, until lately, eminently scanty and insufficient. There was, indeed, an imperfect substitute for them in the statements of several highly trustworthy authors as to certain tribes who spoke a language allied to the Chepewyan, and as to others who did not,—statements which, on the whole, have been shown to be correct; statements, however, which required the confirmation of vocabularies. These have now been procured; if not to the full extent of all the details of the family, to an extent quite sufficient for the purposes of the philologue. They show that the most western branch of the stock, the Chepewyan proper, or the language of the Northern Indians, was closely akin to that of the Dog-ribs, the Hare (or Slave), and the Beaver Indians, and that the Dahodinni, called from their warlike habits the *Mauvais Monde*, were but slightly separated from them. Farther W. a change took place, but not one of much importance. The interpreters were understood with greater difficulty, but still understood.

The Sikani and Sussee tongues are known by specimens of

Language.

considerable length and value, and these languages, lying as far S. as the drainage of the Saskatchewan, and as far W. as the Rocky Mountains, are, and have been for some years, also known as Athabaskan.

Then came the Takulli of New Caledonia. This was the Nagail, or Chin Indian of Mackenzie, or nearly so. Now, *Nagail* I hold to be the same word as *Tacull-i*, whilst *Chin* is *Tshin* = *Dinne* = *Tnai* = *Atna* = *Knai* = *Man*. The Takulli division falls into no less than eleven (?) minor sections, all of which but one end in this root, viz., *tin*.

1. The Tau-*tin*, or Talko-*tin*.
- (?) 2. The Tsilko-*tin*, or Chilko-*tin*, perhaps the same word in a different dialect.
3. The Nasko-*tin*.
4. The Thetlio-*tin*.
5. The Tsatsno-*tin*.
6. The Nulaau-*tin*.
7. The Ntaau-*tin*.
8. The Natliau-*tin*.
9. The Nikozliau-*tin*.
10. The Tatshiau-*tin*, and
11. The Babin Indians.

Sir John Richardson, from vocabularies procured by him during his last expedition, the value of which is greatly enhanced by his ethnological chapter on the characteristics of the population which supplied them, has shown, what was before but suspected, that the Loucheux Indians of Mackenzie River are Athabaskan, a most important addition to our knowledge. Now, the Loucheux are a tribe known under many names,—under that of the Quarrellers, under that of the Squinters, under that of the Thycothe, and Digothi. Sir John Richardson calls them Kutshin, a name which we shall find in several compounds, just as we found the root *tin* in the several sections of the Takulli, and as we shall find its modified form *dinni* among the eastern Athabaskans. The particular tribes of the Kutshin division occupant of either the eastern frontier of Russian America, or the north-western parts of the Hudson's Bay territory, are (according to the same authority) as follows:—

1. The Artez-*kutshi* = Hard people.
2. The Tshu-*kutshi* = Water people.
3. The Tatzei-*kutshi* = Rampart people; falling into four bands.
4. The Teytse-*kutshi* = People of the shelter.
5. The Vanta-*kutshi* = People of the lakes.
6. The Neyetse-*kutshi* = People of the open country.
7. The Tlagga-silla = Little dogs.

This brings us to the *Kenay*. Word for word, *Kenay* is *Knai* = *Tnai*, a modified form of the now familiar root *t-n* = *man*, a root which has yet to appear and reappear under various new, and sometimes unfamiliar and unexpected forms. A *Kenay* vocabulary has long been known. It appears in Lisiansky tabulated with Kadiak, Sitkan, and Unalaskan of the Aleutian Islands. It was supplied by the occupants of Cook's Inlet. Were these Athabaskan? The present writer owes to Mr Isbister the suggestion that they were Loucheux, and to the same authority he was indebted for the use of a very short Loucheux vocabulary. Having compared this with Lisiansky's, he placed both languages in the same category—rightly in respect to the main point, wrongly in respect to a subordinate. He determined the place of the *Loucheux* (*Kutshin*, as he would now call them) by that of the *Kenay*, and made both Kolush. He would now reverse the process, and make both Athabaskan, as Sir John Richardson has also suggested.

The *Atna*, at the mouth of the Copper River, the *Koltshani*, higher up the stream, and the *Ugalents*, about Mount St Elias, are all held by the present writer to be Athabaskan; not, indeed, so decidedly as the Beaver Indians, the Dog-ribs, or the proper Chepewyans, but still Athabaskan.

The most southern of the Athabaskans are the Sussees, in N. latitude 51°; there or thereabouts. But the Sussees, far S. as they lie, are only the most southern of the Athabaskans *en masse*. There are outliers of the stock as far S. as the southern parts of Oregon. More than this, there are Athabaskans in California, New Mexico, and Sonora.

Few discoveries respecting the distribution of languages are more interesting than one made by Mr Hale, to the effect that the Umkwa, Kwaliokwa, and Tlatskanai dialects of a district so far S. as the mouth of the River Colum-

bia, and the upper portion of the Umkwa River (further S. still), were outlying members of the Athabaskan stock—a stock pre-eminently northern, not to say arctic, in its main area.

Yet the dialects just named were shown, by a subsequent discovery of Professor Turner's, to be only penultimate ramifications of their stock, inasmuch as further S., and further S. still, in California, New Mexico, Sonora, and even Chihuhua, as far S. as 30° N. latitude, Athabaskan forms of speech were to be found; the Navaho of Utah and New Mexico, the Jecorilla of New Mexico, and the Apatch of New Mexico, California, and Sonora, being Athabaskan. The Hoopah of California is also Athabaskan.

The KOLUSH of Sitka, &c., can be made Athabaskan by raising the value of the class, or it can stand as the sample of a separate and allied group.

The first of the populations to the S. of the Athabaskan area, who, lying on or to the W. of the Rocky Mountains, are other than Algonkin, are,—

THE KITUNAH.—The Kitunaha, Kutani, Cootanie, or Flatbow area is long rather than broad, and it follows the line of the Rocky Mountains between 52° and 48° N. latitude.

The Kutani, differs notably from the tongues with which it is in geographical contact; though, like all the languages of America, it has numerous miscellaneous affinities.

THE ATNA GROUP.—W. of the Kutanis, and S. of the Takulli Athabaskans, lie the northernmost members of a great family, which extends as far S. as the Sahaptin frontier, the Sahaptin being a family of Southern, or American Oregon.

The *Atna*, called by Mr Hale, Tshihali-Selish languages, reach the sea in the parts to the S. of the mouth of Fraser's River, i.e., the parts opposite Vancouver's Island; perhaps they touch it further to the N. also; perhaps, too, some of the Takulli forms of the speech further N. still reach the sea. The current statements, however, are to the effect that to the S. of the parts opposite Sitka, and to the N. of the parts opposite Vancouver's Island, the two families in question are separated from the Pacific by a narrow strip of separate languages—separate and but imperfectly known. These are, beginning from the N.,—

THE HAIDAH GROUP OF LANGUAGES, spoken by the Skittagats, Massetts, Kumshahas, and Kyganic of Queen Charlotte's Islands and the Prince of Wales Archipelago. Its area lies immediately to that of the S. of the so-called Kolush languages.

THE CHEMMESYAN, spoken along the sea-coast and islands of N. latitude 55°.

THE BILLECHULA, spoken at the mouth of Salmon River; a language to which I have shown elsewhere that a vocabulary, from *Mackenzie's Travels*, of the dialect spoken at Friendly Village, was referable.

THE HAILTSA.—The Hailtsa contains the dialects of the sea-coast between Hawkesbury Island and Broughton's Archipelago; also those of the northern part of Vancouver's Island.

In Gallatin, the Chemmesyan, Billechula, and Hailtsa are all thrown in a group, called *Naas*. The Billechula numerals are certainly the same as the Hailtsa; the remainder of the vocabulary being unlike, though not altogether destitute of coincidences. The Chemmesyan is more outlying still. I do not, however, in thus separating these three languages, absolutely deny the validity of the *Naas* family. I only imagine that if it really contain languages so different as the Chemmesyan and Hailtsa, it may also contain the Haidah and other groups; e.g., the ones that come next, or

THE WAKASH of Quadra and Vancouver's Island.

THE TSHINUK, or Chinuk.

THE KALAPUYA.

THE JAKON; all agreeing in the harshness of their phonesis, and (so doing) contrasted with—

THE SAHAPTIN, and

THE SHOSHONI.

The Sahaptin is separated by Gallatin from the Wailatpu, containing the Cayús or Molelé form of speech. The present writer throws them both into the same group.

The Shoshoni and Sahaptin languages are as remarkable for the apparent ease and simplicity of their phonesis as the Jakon, Kalapuya, and Tshinuk are for the opposite qualities.

Language. South of the Cavús, Wailatpu, and Wihinast, or Western Shoshonis, come—

(a.) The LUTUAMI; (b.) the PALAIK; (c.) the SHASTI, thrown by Gallatin into three separate classes. They are, without doubt, mutually unintelligible. Nevertheless, they cannot be very widely separated.

The Lutuami seems somewhat the most Sahaptin of the three, and this is what we expect from its geographical position, it being continuous with the Molelé (or Cayús) and the allied Wailatpu. It is also continuous with the Wihinast, Shoshoni, or Paduca, as is the Palaik. Both Palaik and Lutuami (along with the Shasti) have Shoshoni affinities.

Of three languages spoken in the N. of California, and mentioned in Schoolcraft by name, though not given in specimens—(1), the Watsahewa; (2), the Howteteah; and (3), the Nabitse, the first of which is said to be that of the Shasti bands.

Of the Howteteah I can say nothing.

The Nabitse is probably the language of the Tototune; at least, Rogue's River is its locality, and the Rascall Indians is an English name for the Tototune.

South of the Shasti and Lutuami areas we find—

1. The EHNİK.
2. The TAHELEWAH.

The junction of the Rivers Klamath and Trinity gives us the locality for—

The LANGUAGES AKIN TO THE WEITSPEK.—The Weitspek itself is spoken at the junction, but its dialects of the Weyot and Wishosk extend far into Humboldt county, where they are probably the prevailing forms of speech, being used on the Mad River, and the parts about Cape Mendocino.

The Weyot and Wishosk are mere dialects of the same language. From the Weitspek they differ much more than they do from each other. It is in the names of the parts of the body where the chief resemblances lie.

The MENDOCINO (?) GROUP.—This is the name suggested for the *Choweshak*, *Batendaikai*, *Kulanapo*, *Yukai*, and *Khwaklamayu* forms of speech collectively.

1, 2. The Choweshak and Batendaikai are spoken on Eel River, and in the direction of the southern branches of the Weitspek group, with which they have affinities.

3, 4, 5. The *Kulanapo* is spoken about Clear Lake, the *Yukai* on Russian River. These forms of speech, closely allied to each other, are also allied to the *Khwaklamayu*.

We may now turn to the drainage of the Sacramento and the parts S. of the Shasti area. Here we shall find three vocabularies, of which the chief is called—

The COPEK.—How far this will eventually turn out to be a convenient name for the group (or how far the group itself will be real) is uncertain. A vocabulary in Gallatin from the Upper Sacramento, and one from Mag Readings (in the S. of Shasti county), belong to the group.

The PUJUNI.—Concerning this we have a notice in Hale to the effect that, about 80 or 100 miles from its mouth, the River Sacramento formed a division between two languages, one using *momí*, the other *kik* = water.

The Pujuni, &c., say *momí*, as did the speakers of the Chepo.

For this group we have—(a.) Pujuni, (b.) Secumne, and (c.) Tsamak specimens, as also the Cushna vocabulary, from the country Yuba, the Cushna numerals, as well as other words, being nearly the same as the Secumne.

The MOQUELUMNE GROUP.—The name *Moquelumne* is proposed, inasmuch as we find a Moquelumne Hill (in Calaveras county), and a Moquelumne River within the area over which the languages belonging to it are spoken. Again, the names of the tribes that speak them end largely in *mne*, *Chupumne*, &c. As far S. as Tuolumne county the language belongs to this division.

These make a provisional division for a vocabulary called—

The COSTANO.—The tribes under the supervision of the Mission of Dolores were five in number—the Ahwastes, the Olhone, or Costanos of the coast, the Altahmos, the Tulomos, and the Romonans.

The MARIPOSA LANGUAGES.—In the N. of Mariposa county, and not far S. of the Tuolumne area, the language seems changed, and the *Coconoos* is spoken by some bands on the Mercede River, under a chief named Nuella. They are said to be the remnants of three distinct bands, each with its own distinct language.

The SALINAS GROUP.—This is a name which I propose for a group of considerable compass, and one which contains more than one mutually unintelligible form of speech. It is taken from the River Salinas, the drainage of which lies in the counties of Monterey and San Luis Obispo.

The Ruslen, Eslen, San Antonio, and San Miguel of this group are probably four mutually unintelligible languages.

The Salinas languages are succeeded to the S. by the forms of speech of—

The SANTA BARBARA GROUP, containing the Santa Barbara, Santa Inez, and San Luis Obispo languages.

The CAPISTRANO GROUP.—Capistrano is a name suggested by that of the Mission of San Juan Capistrano. The group, I think, falls into two divisions—

1. *The Proper Capistrano*, or *Netela*, of San Luis Rey and San Juan Capistrano.
2. *The San Gabriel*, or *Kij*, of San Gabriel and San Fernando.

The YUMA LANGUAGES.—At the junction of the Gila and Colorado stands Fort Yuma, in the district of the Yuma Indians. They occupy each side of the Colorado, both above and below its junction with the Gila. How far they extend northwards is unknown, probably more than 100 miles. They are also called *Cuchans*, and are a fierce predatory nation, encroaching equally on tribes of their own language and on aliens.

From these Yuma Indians I take the name for the group now under notice. It contains, besides the Yuma Proper, the Dieguno of San Diego, the Coco-maricopa, and the Cochimi (succeeded by the Waikur and Perien) of Old California.

The Coco-maricopa Indians are joint occupants of certain villages on the Gila, the population with which they are associated being *Pima*. Alike in other respects, the Pima and Coco-maricopa Indians differ in language.

That the Pima group contains the Pima Proper, the Oyata, and the Eudeve, may be seen from the Mithridates. That the language of the Papagos, or Papago-cotam, is also Pima, rests upon good external evidence. Whether the speech of the Ciris, and population of the island of Tiburon and the parts opposite, be also Pima is at present uncertain.

W. of the Pima lies the Tarahumara, and S. of it the Hiaqui, succeeded by the Tubar and Cora of Sinaloa.

The Paternosters of these four languages, compared with the Oyata dialect of the Pima, suggest the likelihood of a closer relationship than is usually admitted.

With these end our *data*, but not our lists of dialects. The names Maya, Guazave, Heria, Sicuraba, Xixime, Topia, Tepeguana, and Acaxee, all being either in Hervas, or elsewhere, as applied to the different forms of speech of Sonora and Sinaloa, to which may be added the Tahu, the Pacasca, and the Acasca, which is probably the same word as Acaxee, as Huima is the same as Yuma, and Zaque as Hiaqui. Of the Guazave a particular dialect is named as the Ahome. Add also the Zoe and Huitcole, probably the same as the Huite.

That some of these unrepresented forms of speech belong to the same class with the Pima, Hiaqui, &c., is nearly certain. How many, however, do so is another question; it may be that *all* are in the same predicament, it may be only a few.

The languages of Mechoacan are—

1. The PIRINDA.
2. The TARASCA.
3. The OTOMI.

More has been written on the Otomi than any other language of these parts, the proper Mexican not excepted. It was observed by Naxera that it was *monosyllabic* rather than *polysynthetic*, as so many of the American languages are, with somewhat doubtful propriety, denominated. A Mexican language, with a Chinese characteristic, could scarcely fail to suggest comparisons. Hence the first operation on the Otomi was to disconnect it from the languages of the new, and to connect it with those of the old world. With his accustomed caution, Gallatin satisfies himself with stating what others have said, his own opinion evidently being that the relation to the Chinese was one of analogy rather than affinity.

Doubtless this is the sounder view, and one confirmed by three series of comparisons made by the present writer.

The first shows that the Otomi, as compared with the mo-

Language. nosyllabic languages of Asia *en masse*, has several words in common. But the second qualifies our inferences by showing that the Maya, a language more distant from China than the Otomi, and by no means inordinately monosyllabic in its structure, has, there or thereabouts, as many. The third forbids any separation of the Otomi from the other languages of America, by showing that it has the ordinary amount of miscellaneous affinities.

In respect to the Chinese, &c., the real question is, not whether it has *so many affinities with the Otomi*, but whether it has *more affinities with the Otomi than with the Maya or any other American language*,—a matter which we must not investigate without remembering that *some* difference in favour of the Otomi is to be expected, inasmuch as two languages with short or monosyllabic words will, from the very fact of the shortness and simplicity of their constituent elements, have more words alike than two polysyllabic forms of speech.

The fact, however, which most affects the place of the Otomi language is the monosyllabic character of other American languages; *e.g.*, the Athabaskan and the Attakapa.

UTAH AND NEW MEXICO.—The comparative civilization of the Pueblo Indians of New Mexico has always attracted the attention of the ethnologist. Until lately, however, he had but a *minimum* amount of trustworthy information concerning either their habits or their language. He has now a fair amount of *data* for both. For philological purposes he has vocabularies for six (probably for all) of them.

Of the Pueblo languages two belong to the drainage of the Rio Colorado, and four to that of the Rio Grande. Of these two divisions the former lies the farthest W., and of the two Colorado Pueblos, the most western is that of—

The *Moqui*.—The Moqui vocabulary was procured by Lieut. Simpson from a Moqui Indian who happened to be at Chelly.

The *Zuni* country lies in 35° N. latitude, to the S. and E. of the Moqui, and is probably divided by the Sierra de Zuni from—

The *Acoma*, or *Laguna*, the most southern of the Pueblos of the Rio Grande. N. of the Acoma area lies that of—

The *Jemez*, on the San Josef.

The two that still stand over lie on the main stream of the Rio Grande itself. They are—

The *Tesuque*; and

The *Taos* or *Picuri*.—The northern boundaries of the Tesuque seem to be the southern ones of Taos. Connect these *Pueblos* with the town of Taos, and the Tesuque with Santa Fé, and the ordinary maps give us the geography.

The philological affinities of the Pueblo languages scarcely coincide with the geographical relations. The Moqui lies far W. Laying this then out of the question, the three that most strike the eye in tables, as agreeing with each other, are the Laguna, the Jemez, and the Tesuque. The other two that thus outwardly agree are the Taos and the Zuni,—two that are not in the most immediate geographical juxtaposition.

The Moqui, which is not to be separated from the other Pueblo languages, has, out of twenty-one words compared, eight coinciding with the Utah.

Neither are there wanting words common to the Pueblo languages and those of the Athabaskan Navahos, Jecorillas and Apaches.

It is convenient, in a notice of the languages of the state of TEXAS, to bear in mind its early, as well as its present, relations to the United States. In a country where the spread of the population from the other portions of the Union has been so rapid, and where the occupancy is so complete, we are prepared to expect but a small proportion of aborigines. And such, upon the whole, is the case. The displacement of the Indian tribes of Texas has been great. Even, however, when Mexican, Texas was not in the category of the older and more original portions of Mexico. It was not brought under the *régime* of the missionaries, as we may see by turning to that portion of the Mithridates which treats of the parts W. of the Mississippi. The references here are to Dupratz, to Lewis and Clarke, to Charlevoix, to French and English writers, rather than to the great authority for the other parts of Spanish America—Hervas. And the information is less precise and complete. All this is because Texas, in the earlier part of its history, was, in respect to its exploration and description, a

part of Louisiana (and, as such, French) rather than a part of Language. Mexico (and as such, Spanish).

The notices of Texas, in the Mithridates, taken along with our subsequent *data*, are to the effect that (*a.*) the *Caddo*, (*b.*) the *Adaize* or *Adahi*, (*c.*) the *Attakapa*, and (*d.*) the *Choktah*, are the prevailing languages of Texas; to which may be added a few others of minor importance.

The details as to the distribution of the subordinate forms of speech over these four leading languages are as follows:—

(*a.*) The Nandakoes, Nabadaches, Alich (or Eyish), and Ini, or Tachi, are expressly stated to be *Caddo*; and, as it is from the name of the last of these that the word Texas is derived, we have satisfactory evidence that *some* members, at least, of the Caddo family are *truly and originally* Texian.

(*b.*) The Yatassi, Natchitoches, *Adaize* (or *Adaye*), Nacogdoches, and Keyes, belong to the Caddo confederacy, but without speaking the Caddo language.

(*c.*) The Carancouas, the *Attacapas*, the Apelusas, and the Mayes, speak dialects of the same language.

(*d.*) The Tunicas speak the same language as the Choktahs.

Concerning the philology of the Washas, the Bedies, the Acoosesaws, and the Cances no statements are made.

It is obvious that the information supplied by the Mithridates is measured by the extent of our knowledge of the four languages to which it refers.

Of these, the Choktah, which Adelung calls the Mobilian, is the only one for which the Mithridates itself supplies, or could supply, specimens; the other three being unrepresented by any sample whatever. Hence, to say that the Tachi was Caddo, that the Yatassi was Adahi, or that the Carancoua was Attacapa, was to give an instance, in the way of explanation, of the *obscurum per obscurius*. Since the publication of the Mithridates, however, we have got samples of all three—Caddo, Adahi, and Attacapa.

The tendency of the Mithridates is to give prominence to the Caddo, Attakapa, and Adahi tongues, and to incline the investigator, when dealing with the other forms of speech, to ask how far they are connected with one of these three. The tendency of the later writers is to give prominence to the Cumanch, and to suggest the question: How far is this (or that) form of speech Cumanch, or other than Cumanch?

A *Washita* vocabulary, which will be referred to in the sequel, concludes the list of Texian languages known by specimens.

At present, the chief question respecting the philology of Texas is one of distribution. Given, as centres to certain groups—

1. The Choktah,
2. The Caddo,
3. The Adahi,
4. The Attakapa,
5. The Cumanch, and
6. The Washita languages—

how do we arrange the tribes just enumerated? Two works help us here,—1. *A Letter from the Ex-President Burnett to Schoolcraft on the Indians of Texas*; date 1847. 2. *A Statistical Notice of the same by Jesse Stem*; date 1851.

Stem's statistics run thus:—

TRIBES.	NUMBERS.	TRIBES.	NUMBERS.
Towacarros.....	141	Caddos.....	161
Wacos.....	114	Andarcos.....	202
Ketchies.....	38	Ioni.....	113
Tonkaways.....	1,152	Lipans.....	500
Wichitas.....	100	Cumanches.....	20,000

giving us several of the names that have already appeared; giving also great prominence to the Cumanches—numerically at least.

In Mr Burnett's *Letter* the term *Caddo* is prominent; but whether it denote the Caddo language, or merely the Caddo confederation, is uncertain. Neither can I find from the context whether the statements respecting the Indians of the Caddo connection (for this is what we must call it at present), are made on the personal authority of the writer, or whether they are taken, either directly or indirectly, from the Mithridates. The term that Burnett uses is *stock*, his statement being that the Waco, the Tawacani, the Towiah, the Aynic, the San Pedro Indians, the Nabaducho, and the Nacodochets, are all both Texian in origin and Caddo in stock.

His other tribes are—

Language. 1. The *Ketchi*, a small tribe on Trinity River, hated by the Cumanches as sorcerers, and, perhaps, the same as—

2. The *Hitchi*, once a distinct tribe, now assimilated with their neighbours.

3. The *Tonkaways*, a separate tribe, of which, however, the distinctive characters are not stated.

Whatever may be the exact details of the languages, dialects, and subdialects of Texas, the general outline is simple.

The *Choctah* forms of speech are anything but native. They are of foreign origin and recent introduction. So are certain Sioux and other dialects spoken within the Texian area.

The *Cumanch* is in the same predicament; though not, perhaps, so decidedly. It belongs to the Paduca class, and its affinities are with the Shoshoni and Wihinast of Oregon.

The *Caddo* Proper is said to be intrusive, having been introduced so late as 1819 from the parts between the great Raft and the Natchitoches, or Red River. I hold, however, that some *Caddo* forms of speech must be indigenous.

The *Witchita* is probably one of these.

The *Adahi* has already been noticed as being a comparatively isolated language, but, nevertheless, a language with numerous miscellaneous affinities.

The *Attacapa* is one of the pauro-syllabic languages of America, by which I mean languages that, if not monosyllabic after the fashion of the languages of south-eastern Asia, have the appearance of being so. They form a remarkable class, but it is doubtful whether they form a natural one; *i.e.*, whether they are more closely connected with each other in the other elements of philological affinity than they are with the tongues not so characterized. They deserve, however, what cannot be given in the present paper, a special consideration.

For the north-eastern districts of Mexico, New Leon, Tamaulipas, &c., *i.e.*, for the parts between the Rio Grande and Tampico, no language is known to us by specimens. It is only known that the *Cumanch* dips deeply into Mexico. So does the *Apatsh*.

A tribe, lately mentioned, that of the Lipans, is, *perhaps*, *Apatsh*. Burnett states that they agree with the Mescalero and Seratics of the parts about the Paso del Norte. For these, however, we still want vocabularies *is nominibus*.

For the parts about Tampico the language belongs to the Huasteca branch of—

The *MAYA*.—The *Maya* succeeds the languages just enumerated on the east. On the west, the *Otomi*, *Pirinda*, and *Tarasca* are succeeded by—

The *MEXICAN PROPER*.

The languages that, from their comparative obscurity, claim the attention of the investigator, are those which are *other than Maya*, and *other than Mexican Proper*.

Of these, the first succeeds the Huasteca of Huastecapan, or the parts about Tampico; which it separates, or helps to separate, from the northern branches of the *Maya Proper*, being—

The *Totonaca* of Vera Cruz.

Cross the watershed from Vera Paz to Oaxaca, and you come to the area of—

The *MIXTECA*.—In the ordinary maps, Tepezcolula, on the boundaries of Oaxaca and Puebla, is the locality for its chief dialect, of which there are several.

The *Mixteca* is the language of Northern Oaxaca.

The *ZAPOTECA* that of Southern Oaxaca.

South of the areas of the three languages just enumerated comes the main division of the *Maya*—the *Maya* of Guatemala and Yucatan, as opposed to the Huasteca of the parts about Tampico. This, however, we pass over *sicco pede*, for—

The *LENCA* dialects of Honduras, San Salvador, &c.; these being from the four Pueblos of Guajiquiro, Opatoro, Intibucá, and Sirmilton, those of the last being shorter and less complete than the others. They are quite recent, and are to be found only in the Spanish edition of Mr Squier's Notes on Central America. The English is without them.

As Mr Squier is the sole authority for the *Lenca* of San Salvador and Honduras, so he is for *Nicaragua*, for which we have specimens of—

1. The *CHORETEGA*;

2. The *NAGRANDA*; and

3. The *WULWA*, of the Chontal district.

The language of the Mosquito country gives us a fourth form

of speech; at least (I think) as different from the *Choretega*, *Language*, *Nagranda*, *Wulwa*, and *Lenca*, as they are from each other. This is—

The *WAIKNA* of the Indians of the coast, and, probably, of several allied tribes inland.

In Costa Rica, a *Talamanca*; in Veragua, a *Bayano*, a *Savanenc*, and a *Cholo* vocabulary carry us into South America, which must not, however, be entered before the languages of North America, to the E. of the Rocky Mountains, have been noticed.

S. of the Eskimo, and S. and E. of the Athabaskan group, come the great class of the languages called—

ALGONKIN, falling into the following (more or less) provisional divisions:—

1. The *Bethuck* of Newfoundland;

2. The *Central Group*, containing the Cree, Skoffi, Micmay, Echemin, Abnaki, Algonkin Proper, Ojibwa, Delaware, Pequod, Mohican, Narraganset, Natick, Massachusetts, Messisauigi, Pamticough, Menomini, Sauk, Potowotami, &c.;

3. The *Shyenne and Arapaho*;

4. The *Blackfoot*.

The vast area of this class extends from Labrador to North Carolina. It surrounds that of the—

IROQUOIS—the Mohawk, Oneida, Onondago, Seneca, Cayuga, Huron, Nottoway, and Tuscarora, &c.

The *SIoux*.—Winnebago, Dakota (with divisions and subdivisions), Assineboin, Upsaroka (Crow), Mandan, Minetari, Osage. The *Sioux* area lies chiefly between the Mississippi and the Rocky Mountains.

The *Woccon* (with which associate the *Catawba*) of Carolina.

The *CHEROKEE* of Tennessee, &c.

The *CHOCTAH*, *MUSKOGHE*, and *CREEK* of Florida, &c.

The *Caddo* (see notice of Texas) have all *Sioux* and *Iroquois* affinities; as have also—

The *RICCAREE* and *PAWNEE* of Kansas and Nebraska.

In Alabama, Mississippi, and Louisiana.

The *NATCHEZ*, *UCHE*, and *CHELOMACHA*, have miscellaneous affinities, but still have to be definitely fixed.

They are succeeded by the *Adahi* and *Attacapa*, already noticed.

In South America we begin with a very obscure area. In the *Mithridates* there is no specimen of any sufficient length of any of the languages of New Grenada, of which the chief was called the *Muyska*. Neither, until lately, did the present writer know of any vocabularies. He wrongly imagined that all the Indian forms of speech were extinct, and has erroneously stated as much in his work on the *Varieties of Man*. This opinion he now corrects. The *Bibliotheca Glottica* of Ludwig gives the following data. For (see *sub. voc.*)—

The *Andaqui* of the territory of Mocoa, a vocabulary taken in 1854 by the Presbyter Manuel Marca Albis.

Notices of some words of the *Coconucos*, *Polindaras*, and *Guambras*, in the province of Cundinamarca.

Vocabulary of the *Correguaje*, spoken in the territory of Mocoa.

Do. of the *Guaque*, *ibid.*

Do. of *Inganos*, *ibid.*

The *Muyska Proper*, or *Chibcha*, nearly extinct, is spoken in the neighbourhood of Santa Fè de Bogota. The chief dictionary of it is in MSS. (See Ludwig, *ad voc. MUYSKA*).

To the south the languages of New Grenada are succeeded by—

The *QUICHUA* of Bolivia and Peru, the language of the Incas, spoken from the equator to S. Lat. 28. The *Quichua* area almost surrounds that of—

The *AYMARA* of the parts about the Lake Titicaca, to which it is allied.

The *Quichua* is spoken as far inland as Tucuman; but over a great portion of its area it is an intrusive and foreign language, a fact which leads us to the consideration of the minor, and less known language, within its area, or on its precincts. These, though probably numerous, are little known by specimens. There is one of the *ZAPARA* language of the province of Mainas, which looks like an independent form of speech. There is also the—

YURAKARES of the eastern slope of the Andes, in 17° S. Lat.

In Venezuela and Demerara, the great—

Language. CARIB family takes the same prominence as the Quichua in Peru. To it belong the Chayma, Tamanak, Arawak, Accawa, Macusi, Arecuna, Maionkong, Guinai, Soerikong, Wayawara, Maopetyan, Tiverighotto, Pianoghotto, and most of the numerous languages whose names end in *ghotto*.

Akin to the Carib are several of the languages of the Orinoco, Rio Negro, and northern bank of the Amazons, of which we know by specimens the—

SALIVA, MAYPURE, YABURA, and OTTOMACA groups, of undetermined value.

With Carib and Maypure affinities, in proportions hitherto unascertained, we find on the northern affluents of the Amazons, the Uainambu, Tariana, Isanna, Barre, and Tomo-Maroa forms of speech; and somewhat more isolated (though with miscellaneous affinities), the Juri, the Javita, the Coretu, Cobeu, and Tucano, known from vocabularies in Mr Wallace's work on the Amazon and Rio Negro.

In a similar state of isolation, as compared with the definite and undoubted members of the Carib family (though still with miscellaneous affinities), are the Warow, Taruma, and Wapishana of Demerara.

In Brazil there is the great family of the GUARANI tongues, and, by the side of it, the analogues of the minor languages of the Inca and Carib districts. Thus, of the Brazilian languages

OTHER THAN GUARANI we know, by specimens, the Botocudo, Coropo, Coroado, Puri, Machacali, Malali, Camacan, Menieng, Cachriaba, Kiriri, Sabujah, Timbira, and others. Of—

THE GUARANI, the Guarani Proper (the basis of the Lingua Geral, Lingua Franca), the Chiriguano, the Omagua, the Mundrucu. The Omagua is spoken on the Napo, the Chiriguano on the La Plata; so wide is the vast Guarani area. (See *Ethnology*.)

Passing over large tracts of *terra incognita*, in the Missions of Moxos and Chiquitos, the Moxa, Movima, Cayuvaya, Sarabeca, Covareca, Pacaguara, Curuminaca, and Paicoconca forms of speech, known by specimens, with miscellaneous affinities, and leading to the languages of the Chaco, which form a class of considerable compass called—

ABIPONIAN — Abiponian Proper, Mbocobi, Toba, Payagua (?) Lengua, and Zamucu (?). The exact relations of these to the Lule is uncertain. We approach, however, another group.

THE CHILENO-PATAGONIAN—The Araucarian (Chileno Proper), the Pampa (?), the Patagonian, and the Fuegian.

A recent and valuable contribution to the philological ethnography of America, by Mr Daa of Christiania, besides giving a comparison of the Samoyed of Asia with the Dakota of America (along with much other subsidiary matter), contains more than one suggestion respecting the forces by which changes in language are effected. Great stress is laid upon the size of the community that uses it. "When language is confined to the daily use of a family, or a small knot of acquaintance, it stands in a quite contrary relation to the use of men, than when it is the common medium that combines millions of human beings. In the last case, the individual license in changing the adopted sounds and significations of words, whereby are introduced novelties of speech, is continually checked by the impossibility of making all such unnecessary changes comprehensible to the mass of those who speak. Thus we see that in the present English and French languages, this license of adding to what is the common property of millions in both hemispheres, is a privilege for only a few distinguished inventors of new things, or authors of widely-read books. The power of changing language is so much repressed, that it can only be observed by comparing two remote periods of the history of the language, as you observe the geological changes by considering generations as merely a single day. The habit of speaking distinctly is then kept up and cultivated as a necessary means to be comprehended by the many unknown persons you continually meet with.

"In a small island in the South Sea, or an insignificant tribe in the wildernesses of America or Siberia, the facility of changing language may easily be conceived to be next to unbounded. Everybody who speaks must become understood, because his hearers almost know beforehand what he is to say. The most arbitrary changes of languages are thus introduced continually, as may be proved historically.

"Almost all those languages that are spoken by nations living either in a natural (geographical) isolation, or in an arbitrary and artificial one, want a great number of letters. For one letter in one dialect is substituted another letter in the next tribe; because every word is as well understood whether you pronounce it with the letter *r*, or *l*, or *v*. Accidental and individual defects of uttering are thus changed into national peculiarities, and a general indistinctness of pronunciation is introduced. The sounds that are hardly perceptible to a stranger will, among close relatives, appear sufficiently intelligible.

"The strange practices of mutilating the nose and the lips must have contributed a great deal to disfigure the enunciation of language itself. The insertion of one or more large pieces of wood into incisions in the lips or the nose, still practised on the Pacific coast, and from which custom a tribe is called *Naz Percé*, has no doubt been more frequent formerly. These mutilations would evidently make it next to impossible to pronounce any labial consonant, and they would in return introduce a nasal articulation. Now a paucity of labial, and a superfluity of nasal sounds, is just what we observe in many American languages.

"Similar permutations of letters of course happen among all languages of the world, and in fact form the basis and the principal means by which the differences in language are introduced and produced. Only among those nations who lead an isolated life are these changes more violent, and appear to separate tribes that evidently, from their general habits and manners, must be very closely related. Thus the Dakotas, forming only a nation of 25,000 individuals, are split into tribes divided by such considerable differences of dialect as these—one tribe changes *d* into *t*, and *h* into *r*; another changes *h* into *k*; a third changes *h* into *g*; *d* is altogether rejected, and *l* substituted in its place; another band only uses *g* at the end of syllables, and *l* does not occur; thus, the word *hda*, 'to go home,' becomes *kda* and *gla* in different dialects.

"In the syllabic alphabet invented for the Cherokee tongue by a native, the whole number of possible syllables is merely seventy, besides the vowels. In the excellent Dakota Dictionary of Mr Riggs we see abundant proofs how a scarcity of radical words and simple ideas is made to expand into a language of endless compositions. But, from the variety of objects to be expressed, these composed words in a great measure must contain the most arbitrary descriptions of things: a continual make-shift of substitutes for the thing that is thus obscurely brought before the mind. For instance, the word *maza* means 'metal of any kind,' *gadi* 'merchandise;' hence are derived, by addition of other substantives, or adjectives and particles, compositions expressing an *anchor*, *iron pot*, *bracelet*, *bell*, *trap*, *chair*, *gun* and all its parts, *pistol*, *cannon*, *lock*, *ramrod*, &c., *nail*, *steelyard*, *blacksmith*, *spade*, *fingerring*, *stove*, *skates*, *sword*, *iron*, *silver*, *money*, *dollar*, *shilling*, *bank-note*, *medal*, *gold*, *lead*, *bullet*, *moulds*, *copper*, *pewter*, *button*, *spoon*, *pan*, *brass*, *file*, *hammer*, *pincers*, *tongs*. In like manner the syllable *ta* comprehends all ruminating animals and their parts.

"The state of small isolated tribes or clans in which the half-savage nations live will as easily introduce an endless change of significations. In a family, or amongst the inmates of the same house, it is quite as easy to make arbitrary expressions or slang words understood and ultimately accepted of as an indistinct utterance of the common words. Instead of *father*, you may say *master*, *governor*, *husband*, *the old one*, and the original word *father* you may restrict to *God* only; instead of *child* you may use any word signifying *little* or *dear*, &c. We have special accounts of two remarkable instances of the action of this principle among the rude tribes. One is the superstitious custom of the South Sea islanders, on the death of a king whose name is composed of a couple of common words, to abstain altogether from the use of those words that form his name, and to substitute others. The practice is either ascribed to a reverence for him, or to some religious sentiment connected with omens. Such a custom will, of course, in many instances, lead to a permanent instead of a temporary change of language. The other fact upon this head is the sacred languages employed by the conjurors or priests. As far as this has been accurately found out, for instance, in the Greenlandic, it seems to be chiefly an arbitrary pervers-

Language. sion of the significations of old and known words. It is then the same principle as in Europe has formed any slang, for instance, among vagrants and thieves. Yet these words of the conjurers have been so far altered that any double meaning is sufficiently avoided.

"From the effect of these causes it appears probable that as one savage tribe may, from trifling occasions, suddenly split into two, that separate widely from each other, thus also their language may, in a comparatively short time, deviate into two very different dialects. If there were means of investigating the state of a given language of savages in different periods, it would perhaps be demonstrable that its formation as a peculiar dialect, or a variety of speech, does not require those thousands of years, as one might suppose, who starts from the fact, that a great many Greek and Hebrew words have been preserved uncorrupted for thousands of years, through the influence of literature and civilization."

ON THE LANGUAGES OF AFRICA.

Our data for the investigation of the African languages are greater than we expect *à priori*. Many unexplored districts are known in respect to their philology. This is because missionaries, and other investigators, have taken down the accounts of slaves transported from the more inaccessible portions of the continent to either localities on the coast, or to America.

The general distribution of the African languages is that of the languages of the rest of the world, viz., irregular in respect to the different areas of the different tongues. This means that sometimes a single form of speech, with either a paucity of dialects and sub-dialects, or else with a slight amount of difference between its extreme forms, is spread over a large extent of country; whereas, on the other hand, a small tract of land shall contain several mutually unintelligible tongues. The Berber, the Fulah, and the Kaffir tongues are remarkable for the ground they cover; all the parts S. of the equator, with the exception of the Hottentot, being Kaffir, and all the parts N. of Negroland, with the exception of the Arabic and Tibboo districts, being Berber.

The small areas with the greatest number of mutually unintelligible tongues, are the alluvial tracts between the Gambia and Cape Mount, *i.e.*, the deltas and valleys of the Casamansa, Rio Grande, Nunez, &c., then certain districts in Abyssinia.

The areas of moderate or intermediate magnitude are those of the Hausa, Woloff, Mandingo, &c.

The evidence that all the languages of Africa are related to each other is, in the mind of the present writer, though not, perhaps, to the majority of investigators, conclusive. This rests upon two series of facts—the accumulation of new materials and the breaking down of distinctions which at first sight appear more definite and trenchant than they really are.

This latter process has taken place most especially with the tongues of the extreme N. and the extreme S.

To begin with the former. The languages akin to the Hebrew and Arabic—Semitic as they are called—were long either isolated, or, if connected with those of any other class, connected with the so-called Indo-European forms of speech. This was on the strength of the higher civilization, greater historical importance, and superior physical organization of the nations which spoke them. Writers, however, were not slow to observe that the populations of Northern Africa in general were, to a great extent, possessed of the same characteristics. Such were the Egyptians, whose language was the Coptic, a language which was one of the first to be recognised as one exhibiting Semitic characteristics. This was not doubted. It was only doubted whether the Coptic was, in the ordinary sense of the word, African.

Then came a language to which the French conquest of Algeria gave prominence, whilst it also made it accessible; the language of the Kabyles, Tuaricks, Siwans, and Canary islanders. This was recognised, if not as actually Semitic, as what was designated by the new term, *sub-Semitic*.

That other tongues, especially those in geographical contact with the Kabyle (Berber or Amazirgh), were, more or less, what the Berber was, was shown by even the Berber scholars; the foremost of whom recognised, in the Hausa of Sudania, Berber elements. (See a paper by Francis Newman in the Appendix to Pritchard's *Physical History of Man*.)

VOL. XIII.

Then came the turn for the tongues to the south of the Coptic area to be considered as, more or less, Coptic; *e.g.*, the Bisharye, the Nubian, and the Galla; and, finally, that for the languages of Abyssinia in contact with the recognised Semitic tongues (such as the Tigre, Amharic, &c.), but not themselves Semitic. Of these, the Agow and Falasha forms of speech are the chief.

With this relation between the Semitic and sub-Semitic classes—a relation made patent by the name itself—the question as to the relations of the African languages at large must either remain stationary, or one of two alternatives be resorted to.

Either languages like the Hausa, Nubian, Agow, &c., must lead to the true Negro tongues, or they must be wholly separated from them. It is not too much to say that, on the part of the proper Semitic philologues, the tendency was towards separation. This, however, was impossible. Whoever knew anything of the other African languages knew that for every step from such languages as the Coptic and Berber, towards the Hebrew and Arabic, a similar advance could be made in the opposite direction, *i.e.*, towards the Fellatah, Mandingo, and Woloff, and through these to the most Negro languages of the whole continent.

On the south there are the same apparent differences, and the same abrogation of them; two languages coming more especially under notice,—

1. *The Hottentot*.—It is doubtful whether the presumed isolation of the Hottentot forms of speech rests on purely philologic grounds; indeed, it is pretty certain that it does not. The same is the case with the Semitic and sub-Semitic tongues, wherein physical difference has as much to do as glossarial. The contrast between the Bushman, and not only the so-called higher races in general, but his immediate neighbours, is great. At the same time, there are many more transitional and intermediate forms than is generally believed, especially in the northern parts of the Hottentot area. The articulate sound described as a *click* characterizes the Hottentot languages. Like most points of phonesis, its import has been overvalued. It is not limited to the Hottentot, and would not prove isolation if it were. More than one Kaffir dialect has it. Then there is a kind of gender in the Hottentot grammar; a fact which has led some able philologists to the preposterous doctrine, that it has an affinity with the more cultivated tongues of Europe. It has some Kaffir affinities too, and others (perhaps more numerous) with the languages N. of the Kaffir area—a matter that should by no means surprise us, inasmuch as the amount of displacement along the whole frontier has been great.

The comparison of the scanty specimens of a scanty language gives us the following miscellaneous Hottentot (*H*) affinities with the other languages of Africa (*A*):—

<i>English</i>	sun.	<i>English</i>	mountain.
<i>H. S</i>	<i>i'kora.</i>	<i>H. Corana</i>	<i>teub.</i>
Hottentot	<i>sorre.</i>	<i>A. Falasha</i>	<i>duba.</i>
Corana	<i>sorob.</i>	<i>English</i>	ear.
<i>A. Agow</i>	<i>quorah.</i>	<i>H. Corana</i>	<i>i'naum.</i>
Somauli	<i>ghurrah.</i>	<i>A. Bullom</i>	<i>naimu.</i>
Kru	<i>gruro.</i>	<i>English</i>	star.

In respect to the so-called genders, the following table shows how little they are those of the European languages. The forms are simply compounds. They are taken from the *Abriß der Formellehre der Namaqua-Sprache* (Barmen, 1854); the German *ich, dur, &c.*, being translated into Latin:—

I.			II.

¹ Mulier ego, &c., as *Homo ego*.

² *Homo ego* (Mensch), &c., as with the other two.

By turning to the Lexicon, we find, *aub*, man; *aus*, woman; *awi*, person; *taras*, woman; *koib*, man; *kois*, woman; *koii*, person (Germ. *mensch*). There is an expression of sex here, but no true gender.

The *Kaffir* tongues have two notable characteristics,—(1.) Alliteration; (2.) The system of prefixes.

According to the former, when two words stand in certain

grammatical relations to one another, the initial letter of the subordinate is changed to that of the governing term, just as if we said, in English, *bun-beam* instead of *sun-beam*.

According to the latter, every noun has, as its concomitant, some non-radical prefix, so necessary, that when the missionaries would introduce such English words as *priest* or *pharisee*, the form they gave them in Kaffir was *um-priest*, *um-pharisee*.

These two characteristics give a very remarkable physiognomy to the language. Doing this, they have a tendency to create broad and definite lines of demarcation. Hence the separation between the Semitic tongues on the N. and the inland and western dialects, is repeated in the S. between the Kaffir and the non-Kaffir languages.

The ethnological import of the two characteristics in question has never been very closely considered. They may mean much; they may mean little.

Their absence may separate languages, otherwise like, from the Kaffir; their presence may connect languages otherwise unlike. So, at least, was the opinion of many investigators; for the fact suggested is a real one.

Both have been discovered elsewhere. The Timmani is a language of the parts about Sierra Leone. It is a language of Northern Africa. That it exhibits the so-called characteristics of the Kaffir tongues of South Africa, is notified by Bishop Vidal in the preface to his edition of Crowther's *Toruba Grammar*. Mr Norriss had, by independent researches, arrived at the same conclusion.

The import of this coincidence is another question. That the most northern of all the Negro languages, the Woloff, exhibited a remarkable series of euphonic initial changes, had been known since the time of Dard. The Woloff changes, however, were not so Kaffir as the Timmani.

But there is another series of facts. The language of all the languages of Africa, wherein the Kaffir characters are at a minimum, is the Mandingo—at least in the proper Mandingo dialect. Writers who have made everything that was Kaffir-like Kaffir, have still left the Mandingo undisturbed. The most that has been done towards even approximating it to Kaffir-like languages has been done by Mr Norriss and Dr Bleek. The former has suggested the likelihood of the signs having been lost—obscure traces of them still being discoverable. The latter has, at one and the same time, pronounced the Grebo dialects to be Mandingo, in respect to the class to which they belong, and South African (Kaffir) in their structure.

But the Timmani is connected by its vocabulary with the Mandingo,—not directly, but still as a member of the same class; that class being one of no inordinate magnitude, and one which does not contain the Kaffir; one, too, which the geographical conditions indicate as likely. How does this affect our classification? Much more than it ought to do. The present tendencies are to make everything Kaffir. True criticism only tells us to look twice before we allow a single characteristic to become the basis of a classification. Naturalists know this. Philologists have yet to learn it. In the mind of the present writer, the Timmani, and other languages in the same category, are Kaffir, in the way that an eel is a snake, a whale a fish, or a bat a bird.

There is another preliminary to the classification of the languages of Africa. We cannot treat them as we treat those of Europe. Everything in Europe is definite; i.e., it is Latin or Greek, German or Celtic, Sarmatian or Turkish,—there being no such thing as an intermediate, transitional, or equivocal form. Hence, we can classify by *definition*, separating tongue from tongue. In Africa we must classify by *type*; i.e., group certain forms of speech round certain others, without being able to separate the outlying members of one class from the outlying members of another. This makes the place of many forms of speech equivocal,—equivocal rather than actually doubtful or obscure. They may belong to two classes at once.

Thus guarded against the expectation of finding greater definitude than the nature of the inquiry will allow, we begin with the parts where Asia and Africa join, and where the (so-called) Semitic touch the (so-called)---

I. *Sub-Semitic* form of speech:—

- (1) Berber (which leads to the Hausa, Tibbu, and Bornui.
- (2) Coptic (which leads to the Bishari, Nubian, and Galla.
- (3) The Gafat, Agow, and allied tongues of Abyssinia.

Language.

- II. The *Nubian* group, containing:—
 (a.) The Kensy, Noub, and Barabra of the specimens, the Dongolawy of Dongola.
 (b.) The Koldaji of Kordovan.
 (c.) The Shelluk, Denka, Takeli, Tumali, Shabun, and Fer- tit of the parts to the S. of Kordovan.
 (d.) The Furian of Darfur, allied to—
 III. The *Bisharye*, between the Nile and Red Sea; and,
 IV. The *Fazoglo* and *Qamamyl* of Bertat.
 To the west of Darfur follow—
 V. The *Borgho* (of Wadai or Darseleh).
 VI. The *Begharmi*.
 VII. The *Mandara*.
 VIII. The *Bornui* or *Canowry* group; which will, prob- ably, when better known, be more closely connected with each other, and also with—
 IX. The *Tibbu* of the eastern part of the desert.
 To the W. of Bornu lie the languages of—
 X. The *Hausa*; and—
 XI. The *native* language of the parts about Timbuctu.
 XII. The *Fulah* groups, leading to the complex philology of the languages known to us on the coast of the Atlantic. Between the southern boundary of the desert and the equator we find, passing from N. to S.—
 XIII. The *Woloff* of the Gambia.
 XIV. The *Mandingo* of the Senegal.
 XV. The *Felup*, &c., for the mouths of the Nunez, Río Grande, &c.
 XVI. The *Grebo* or *Kru*, of the parts about Cape Palmas; passing through—
 XVII. *Avekvom*, of the Ivory Coast, to—
 XVIII. The *Gold Coast* group, containing,—
 (a.) The Fanti (Ashanti);
 (b.) Acra (Cape Castle);
 (c.) Whidah (of Dahomey).
 Akin to which are—
 XIX. The *Yoruba*.
 XX. The *Ibo* (of the Lower Niger).
 XXI. The *Nuñi* (of the Tshadda) leading through—
 XXII–XXIII. The *Efik* of Old Calabar, and the Fernando
 Po language, to—
 XXIV. The *Empoonga* of the Gaboon.
 XXV. The *Bati* of Adamova has miscellaneous affinities with the language last mentioned, and with—
 XXVI. The great *Kaffir* class, which reaches to—
 XXVII. The *Hottentot* area. On the E., Kaffir languages are spoken as far N. as (there or thereabouts) the equator, where they are contemporaneous with a transitional form of speech.
 XXVIII. The *Ukuañi*; and also with—
 XXIX. The *Galla*, which leads us up to Nubia and Abyssinia.
 In the interior, a class of languages spoken by the negroes of Abyssinia is represented by—
 XXX. The *Darmichegan*; and—
 XXXI. The *Tacaze* vocabularies of the specimens; and further inland still, to the S.W. of Abyssinia, we find consti- tuting a class conveniently called—
 XXXII. The *Gonga*, the *Kaffa*, *Woratta*, *Wolaita*, and *Yangaro* forms of speech.
 It is not pretended that the value of all these groups is the same. It is only submitted that there is no African language, hitherto known (and, with few exceptions, all are known), which cannot be referred to some of the previous groups. It is also added, that they have all miscellaneous affinities; in other words, there is no such a thing as isolation.
 The preceding arrangement is a modification of one laid before the British Association for the Advancement of Science in 1844, and expanded (with slight modifications) in 1847, the original form being as follows. It is given for the sake of foreshadowing the more complex classification of divisions and sub-divisions of higher and lower groups, &c., which a more advanced state of our investigations will require.
 1. The Coptic class, containing the extinct dialects of Egypt.
 2. The Berber class, containing the *non-Arabic* languages of northern Africa.
 3. The *Hottentot* class.
 4. The *Kaffir* class, extending from the limits of the Hot- tentot country as far northward as Loango, and the River Juba W. and E.

5. The fifth and last class, which was left unnamed, fell into Language. eleven subordinate groups?—

- | | |
|------------------------|----------------------------|
| 1. The Nubian group. | 7. The Hawssa group. |
| 2. The Galla group. | 8. The Mandingo group. |
| 3. The Borgho group. | 9. The Woloff group. |
| 4. The Begharmi group. | 10. The Fulah group. |
| 5. The Bornu group. | 11. The Ibo-Ashanti group. |
| 6. The Mandara group. | |

Of these groups the ten first were undivided; whilst the eleventh fell into the following sub-divisions:—

- | | |
|--------------------------------|-------------------------------|
| α The Fantee division. | δ The Ibo division. |
| β The Acra division. | ϵ The Nuñi division. |
| γ The Dahomey division. | ζ The Yoruba division. |

Notwithstanding these sub-divisions, the following languages remained unplaced:—

- | | |
|---------------------------|-----------------|
| 1. The Agow dialects. | 4. The Sereres. |
| 2. The Bisharye dialects. | 5. The Akvambu. |
| 3. The Serawoolli. | 6. The Kru. |

These last are now distributed as follows:—The first is sub- Semitic; the second allied to the Nubian and Coptic: the third and fourth Mandingo, with Fulah elements; the fifth Fanti; the sixth intermediate to the Mandingo and Fanti.

The Mandingo, Kru, Ashanti, Woloff, and Fulah will, prob- ably, be brought by future researches more closely together.

That this classification is right in its main elements is ren- dered probable by the confirmation it has received from sub- sequent investigations. The *Polyglotta Africana* of Mr Kölle (published in 1854), as far as it goes—which is to the extent that specimens collected at Sierra Leone carried the writer— gives the same groups, though under different names, the in- vestigation being (I believe) independent. Thus Kölle's:—

I. *North-western Atlantic* languages fall into four groups, represented by the (a.) Felup, (b.) Pepel, (c.) Biafada, and (d.) Timmani languages, respectively each falling into dialects and subdialects.

II. The *North-western High Sudan*, or *Mandingo* lan- guages, constitute the second group.

III. The *Upper Guinea*, or *Middle-coast* languages, the third. This means, the forms of speech akin to (a.) the Kru, (b.) the Dahomey, (c.) the Yoruba.

IV. The *North-eastern High Sudan* languages are spoken inland, at the back of the Ashanti country, and along the eastern range of the Kong Mountains. They are akin to the (a.) Mosee, (b.) Kouri, (c.) Koama, and (d.) Yula forms of speech.

V. The *Niger-delta* group falls into the (a.) Isoama, (b.) Sobo, and (c.) Okuloma divisions.

VI. The *Niger-Tshadda* languages as those akin to the Nuñi.

VII. The *Central African* division contains the languages allied to (a.) the Bornui, and (b.) the Pika.

In Part II. we have the *South African languages distin- guished by an initial inflection*, as has been already stated. It excludes the *Hottentot*, and includes the Old Calabar, Came- roon and Gaboon languages. Doing this, it coincides with the so-called Kaffir class of tongues, in its latest form, i.e., in the form it has taken since it was shown that the Poongwe, the Isubu, the Efik, and other languages, exhibit a similar series of initial changes to those of the Kaffir and Bichuana.

There are of course some differences of detail; the main groups, however, are the same. The first is one for which de- tails were especially wanted. The fourth also is important. It should probably form a separate substantive division of the group called Ibo-Ashanti.

If the foregoing is what the writer believes it to be, viz., the sketch of the classification into which the languages of Africa ought to fall, it is far from being that which the very newest investigations have suggested. The very newest investigations are those of which Mr Norriss, Dr Bleek, and Mr Kölle are the chief representatives; and, in a less degree, perhaps, Professor Lepsius. It is the overvaluation of the Kaffir characteristics (along with certain other points of less importance) that makes these arrangements exceptionable; and it is this against which the preliminary criticism of the previous pages is directed.

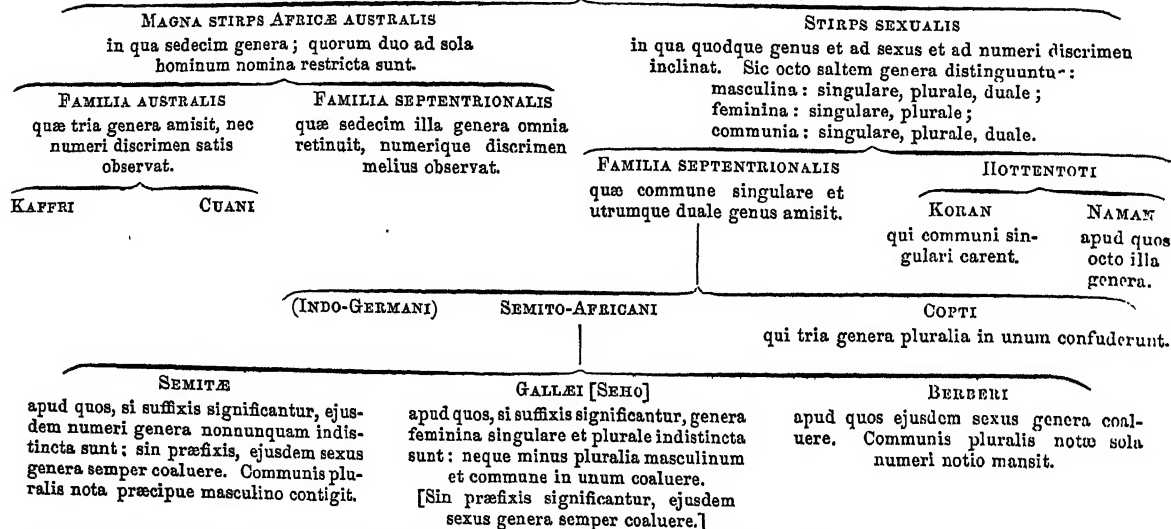

Lest it should be thought unnecessary, I subjoin the follow- ing table from Dr Bleek's paper, *De Nominum Generibus*:—

Language.

LINGUA MATER

Language.

in qua pronomina e nominum particulis derivativis petita sunt, ideoque nomina
in genera dispersa quæ cum naturæ discriminibus non congruunt.

One of the best measures of the truth of a principle, is to be found in the result to which it leads. Here we have one, which, separating the Hottentots from the Kaffirs, connects them with the Egyptians, Algerians (Berberi), Gallas, Jews, and Arabs (Semitæ), and, finally (though more indirectly), with the Sclavonians, Germans, Greeks, and Latins (Indo-Germani). This is what it comes to when we classify on the strength of a single characteristic. The actual details of the ethnographical philology of Africa are important. The principle, however, on which investigators arrive at them is much more so.

To conclude: The preface of a work, not two months old,—*The Languages of the Mozambique, or Vocabularies of the Dialects of Lourenço Marques, Inhambane, Sofala, &c.*, from the MSS. of Dr Peters, by Dr Bleek,—contains the following passage: "The languages of these vocabularies all belong to that great family which, with the exception of the Hottentot dialects, includes the whole of South Africa, and most of the tongues of Western Africa, &c. If so, and if the table be equally accurate, the affinities of the Bushman are with the Parisian, the Londoner, and the Athenian, rather than with the Negro of the Gold Coast, or Sierra Leone.

It is the old error—a bat has wings, therefore it is a bird; an oyster lives in the sea, therefore it is a fish; and so on through the whole range of possible misnomers.

On the so-called Indo-European Class.

As this stands, it contains, according to *all* authorities, the Keltic, the German, the Sarmatian, the Classical (the Latin and Greek), and Sanscrit groups. To these many (perhaps most) add the Armenian and Ossete; some the Albanian. In respect to the import of these terms, the ordinary views make *Gothic and German* nearly synonymous, and Sanscrit the name of a language of *Asiatic* origin, to which the Zend was allied, and out of which and its congeners some Indian and Persian forms of speech have been developed, and to which they are allied, as the Italian, &c., is to the Latin. The greater part of this is believed by the present writer to rest on an illegitimate amount of assumption.

Firstly, that the Keltic was not isolated, but allied to the German, Sclavonic, &c., was shown by Dr Prichard, and excellent service he did in showing it. But that it is allied to these tongues, *as they are to each other*, has never been shown. Yet this is what is wanted, in order to make an addition to a class *without raising its value*. This, however, should never be done without consideration. The principle upon which the value of a class is raised, in order to admit one addition, may be extended so far that, by successive increases of value, it may be no class at all; as the so-called Indo-European class is in a

fair way of becoming. Good reasons can be given for limiting rather than widening it. It can, of course, when thus limited, be subordinated to some other.

Secondly, In respect to the German division, a vast superstructure totters as soon as we inquire for evidence to the assumed fact of any German population whatever having been called *Goth* anterior to its settlement in the country of the Getæ. No such evidence exists. On the contrary, the Germans were Goths as they were Britons, *i.e.*, occupants of British soil, but no Britons at all—nor yet Goths.

Thirdly, The philological evidence of the Sanscrit being of Asiatic origin is that of the Latin of Spain having been Hispanian; certainly no better. It consists in the fact of its appearing on the soil at an early (admittedly a very early) period; a literature indigenous to the Indian soil having existed in it, along with inscriptions, and a certain amount of influence upon the later language. In India, the appearance of the Sanscrit on the soil is earlier than that of the Latin in Spain. On the other hand, no one has doubted the Latin origin of the Spanish language, whilst more than one competent judge has doubted the Sanscrit origin of the Hindui, Bengalee, &c. Yet we know from history that the Latin of Spain was not only not indigenous to the Peninsula, but that it was not even derived from the next country. All that rests upon legitimate inference, in respect to the Sanscrit in India, are the facts of its early introduction and the greatness of its subsequent influence. Its Indian origin, its Persian origin, and the like, are all based upon covert, but undue, assumptions.

Akin to these are the explanations of the affinity between the Sanscrit on the one side, and the Lithuanic, Slavonic, Latin, Greek, and German on the other. The latter are deduced from Asia, *i.e.*, five species of a genus are deduced from the scite of one, instead of the one from the scite of the other five. This is all improbable, except so far as it can be shown that the Dnieper and Danube are nearer to the Indus and Ganges than the Ganges and Indus are to the Danube and Dnieper.

The Asiatic origin of the Greek, Latin, Lithuanic, Slavonic, German, and Keltic, has been assumed at once, without any consideration whatever of the other alternative, *viz.*, the European origin of the Sanscrit. This is over-hasty.

The recent deductions from the Ossete, and its Indo-European affinities, verify what has been said concerning the Keltic. Whatever the Ossete is, the Georgian is also; and the Georgian has been made Indo-European. But what the Georgian is, the Circassian is; which is more Chinese than Greek, more Tibetan than Latin, more Burmese than German. Classifications of this kind prove too much.

It is held that the class in question is most conveniently limited to (1.) the German; (2.) the Classical (Greek and

Language. Latin); (3.) the Sarmatian; and (4.) the Sanscrit groups,—the two last, perhaps, belonging to the same division.

At any rate, the principles upon which the ordinary division has been formed, along with its name, and many important details in the way of fact, require revision.

(T. Y.) (R. G. L.)

LANGUEDOC, (the ancient *Narbonensis Prima*), an old province of the S. of France, of which Toulouse was the capital, now forming the departments of Haute-Loire, Lozère, Ardèche, Gard, Hérault, Aude, and Tarn, the greater part of Haute-Garonne, and a part of Tarn-et-Garonne. As a Roman province, it enjoyed the freedom of Italy. It formed part of Gallia Narbonensis, but, in the middle ages, was known as Septimania from the seven cathedral churches which it contained. From the hands of the Romans, it passed into the possession of the Goths; and, being wrested from them, it was occupied by the Saracens till 725, when they were expelled by Charles Martel. It afterwards came under the sway of Philip the Bold, and became a part of the French kingdom in 1361. During the old Bourbon monarchy, Languedoc had a kind of parliament of its own, of which the archbishop of Narbonne was the perpetual president. The canal of Languedoc is 153 miles in length, commencing in the Garonne, near Toulouse, and terminating in the Lake of Thau and the Mediterranean. See FRANCE.

LANNION (the ancient *Lanium*), a town and river-port of France, capital of a cognominal arrondissement in the department of Côtes-du-Nord, on the right bank of the Guer, near its mouth, 35 miles W.N.W. from St Brieuc. It has manufactures of linen fabrics, leather, hats, ropes, and refined wax; and carries on a trade in flax, hemp, thread, corn, cider, wine, timber, and colonial produce. Its harbour admits vessels of a burthen less than 200 tons. Pop. (1851) 6075.

LANTAO, a small island of China, at the mouth of the Canton River, about 10 miles W. of Hong Kong. It is 15 miles in length from E. to W., by 5 in breadth; has a very uneven surface, and a coast indented by numerous bays.

LANUVIUM, now CIVITA LAVINIA, an old and important city of Latium, on the Appian Way, about 20 miles S. of Rome. Tradition describes it as a colony from Alba, but it first rose to importance in the fifth century B.C., when it took part against Rome as one of the thirty cities of the Latin League. After this date its name does not again appear in history, till, in the long wars between Rome and the Æqui and Volsci, it is found siding with Rome. For some unexplained reason, it changed sides in B.C. 383, but was leniently treated by its old ally at the end of the war. In

the great Latin war, B.C. 340, it again took part against Rome, and, in the general settlement at the close of hostilities, it obtained the Roman civitas, but without the suffragium. At a later period it obtained the suffrage also. After the time of Cicero, Lanuvium became a mere municipal town, and was only important as the chief seat of the worship of Juno Sospita, whose rites were celebrated first by the Lanuvians, and afterwards by the Romans, with great pomp and splendour. Lanuvium was the birthplace of the Emperor Antoninus Pius, who often went to live there, as did also his successors, M. Aurelius and Commodus. The little town of Civita Lavinia occupies part of the site of the old Lanuvium. Some shapeless ruins in the neighbourhood are supposed to mark the site of the temple of Juno; and a small portion of a theatre has also been brought to light.

LANZEROTE. See CANARY ISLANDS.

LANZI, LUIGI, a celebrated Italian archaeologist, and the historian of Italian art, was born in 1732, at Monte dell' Almo (*Ulmodynamum*), near Fermo, in the States of the Church. He was carefully trained at home, and made great and rapid progress, especially in the classics. Cicero was his favourite author. He used to boast that he knew nearly all his works off by heart. In his eighteenth year he joined the Jesuits, studied at their college in Fermo under the celebrated Boscovich, taught publicly in various schools, and made himself a considerable name as a teacher and elegant writer. When the order of Jesus was suppressed, he adopted the career of letters. In 1775, Leopold, Grand Duke of Tuscany, made him sub-director, and, in the following year, *antiquario*, or conservator, of the Florentine Gallery. The next six years of his life were spent in preparing his *Guida della Galleria di Firenze*, in which the history of the objects in the collection is traced with great learning and critical skill, and, at the same time, so agreeably as to interest the mere pleasure-seeker. In 1789 he published his *Saggio di lingua Etrusca*. His design in this essay was to draw the attention of scholars to the archaeology of Tuscany; and he may be said by it to have created this difficult branch of erudition. Before his day native antiquarians had been in the habit of elevating the civilization of Etruria, by maintaining that its religion and mythology owed nothing to Grecian influence. Lanzi, taking a different

Lanzerote
||
Laocoon.

view, claimed a Greek origin for both, and his opinion has been followed by continental scholars. His *Saggio* was a work of immense erudition and research, and placed him at the head of the antiquarians of modern Italy. In the course of his wanderings through Italy in quest of materials for these works, Lanzi had conceived the idea of a general history of Italian art. He was encouraged in the idea by his old friend and colleague, Tiraboschi, who had some time before completed his own history of Italian literature. The *Storia Pittorica della Italia* came in time to supply a want that had long been felt. There was no general history of painting, and the histories of particular epochs, as well as the biographies of individual artists, merely recorded the private opinions and prejudices of their authors. They were all partial, and without method, or a philosophical standard of taste and criticism. Lanzi, following out the plan of Winckelmann, gives a separate history of each school. After giving its general character, he distinguishes it into three, four, or more epochs, according as its style underwent changes with the change of taste, in the same way that the eras of civil history are deduced from revolutions in governments, or other remarkable events. A few celebrated painters, who swayed the public taste, and gave a new tone to the art, are placed at the head of each epoch; and their style is particularly described, because the general and characteristic taste of the age was formed upon their models. Their immediate pupils and other disciples follow the great masters; and, without a repetition of the general character, reference is made to what each has borrowed, altered, or added to the style of the founder of the school. This method, though not susceptible of strict chronological order, is much better adapted to a history of art than either an alphabetic arrangement or a body of separate lives. The first portion of the *Storia Pittorica*, containing the schools of Lower Italy—that is, the Florentine, Siennese, Roman, and Neapolitan schools—was published in 1792. The publication of the rest of the work was delayed by the author's bad health, and only appeared in 1796, at Bassano, whither he had gone to recruit. There is a good translation of it in English by Thomas Roscoe. When the French became masters of that part of Italy, Lanzi retired to Treviso, and afterwards to Udine. In the latter city he remained till 1801, when he returned to Florence, and resumed his duties in the ducal gallery. Soon after his return, he was made president of the Cruscan Academy. His next literary undertaking was three dissertations upon *Ancient Painted Vases, commonly called Etruscan*, which he followed up with his learned and pleasantly written *Inscriptionum et Carminum libri tres*. Among his latest productions may be mentioned his edition of Hesiod's *Works and Days*, with valuable notes, and a translation in *terza rima*. It had been begun as far back as 1785; but was re-cast and completed in 1808. The list of his works closes with his *Opere Sacre*, a series of treatises on spiritual subjects. Lanzi himself attached more importance to these than to any other of his writings, and was often heard to say that he would gladly renounce all kind of literary honours for the pleasure of being assured that his sacred works had in any degree promoted the cause of Christianity. Lanzi died of apoplexy, March 30, 1810, in the seventy-eighth year of his age. He was buried in the church of the Santa Croce at Florence, by the side of Michael Angelo.

LAOCOON, in *ancient mythology*, a Trojan hero, was a priest of Apollo, or, according to some, of Neptune. While the Trojans were hesitating whether they should convey into the city the wooden horse which the Greeks had left at their pretended departure, Laocoon urged them to destroy it, and, at the same time, pierced its side with his lance. The horse had been consecrated to Minerva, who punished the sacrilege. Soon after, when Laocoon was sacrificing a bullock to Neptune on the shore, two enormous ser-

pents issued from the sea, and attacked his two sons, standing beside the altar. The father, rushing to their aid, was likewise involved in their coils, and all three perished. This story, so often sung by ancient poets, is interesting to us, chiefly from being the subject of a magnificent piece of sculpture, which was found, in 1506, among the ruins of the palace of Titus, was bought by Pope Julius II., and placed in the Vatican. It represents three persons (of whom the middle one, Laocoon, is the tallest) struggling in the folds of two monster serpents, and with intense agony visible in all parts of their bodies. According to Pliny, with whose description it has been identified, it is the work of three Rhodian sculptors, Agesander, Polydorus, and Athenodorus, and stood in the palace of Titus. He also supposes it to have been made out of one stone, but minute examination can discover five pieces, artfully joined together. The right arm of Laocoon, which was wanting when the group was dug up, has been skilfully replaced. The date of the work is not fixed. Lessing places it in the reign of Titus, and Winckelmann in the time of Lysippus and Alexander. This group has been made the subject of an essay by Lessing, and has been described by Heyne and others.

LAODICEA, a name common to four places,—one in the western part of Phrygia, on the borders of Lydia; a second in the eastern part of the same country, denominated Laodicea Combusta; a third on the coast of Syria, called Laodicea ad Mare, and serving as the port of Aleppo; and a fourth in the same country, called Laodicea ad Libanum, from its proximity to that mountain. The first-named, lying on the confines of Phrygia and Lydia, about 40 miles E. of Ephesus, is the Laodicea of Scripture.

Laodicea was the capital of Greater Phrygia, and is supposed to have received its name from Laodice, wife of Antiochus Theos. Before this time it had been called Diospolis and Rhoas. It was a very considerable city at the time it was named in Scripture (Strabo, p. 578); but the frequency of earthquakes, to which this district has always been liable, demolished, some ages after, great part of the city, destroyed many of the inhabitants, and eventually obliged the remainder to abandon the spot altogether. Smith, in his *Journey to the Seven Churches* (1671), was the first to describe the site of Laodicea. He was followed by Chandler and Pococke; and the locality has, within the present century, been visited by Mr Hartley, Mr Arundell, and Colonel Leake.

Laodicea is now a deserted place, called by the Turks Eski-hissar (*old castle*), a Turkish word equivalent to *Paleókastro*, which the Greeks so frequently apply to ancient sites. From its ruins, Laodicea seems to have been situated upon six or seven hills, taking up a large extent of ground. To the N. and N.E. runs the River Lycus, about a mile and a half distant; but nearer it is watered by two small streams, the Asopus and Caprus, the one to the W., and the other to the S.E., both passing into the Lycus, which last flows into the Mæander (Smith, p. 85).

Laodicea preserves great remains of its importance as the residence of the Roman governors of Asia under the emperors.—namely, a stadium, in uncommon preservation; three theatres, one of which is 450 feet in diameter; and the ruins of several other buildings (*Antiq. of Ionia*, part ii., p. 32; Chandler's *Asia Minor*, c. 67). Colonel Leake says, "There are few ancient sites more likely than Laodicea to preserve many curious remains of antiquity beneath the surface of the soil; its opulence, and the earthquakes to which it was subject, rendering it probable that valuable works of art were often there buried beneath the ruins of the public and private edifices (Cicero, *Epist. ad Amic.*, ii. 17; iii. 5; v. 20. Tacit. *Annal.*, xiv. 27). And a similar remark, though in a lesser degree, perhaps, will apply to the other cities of the vale of the Mæander, as well as to some of

Laodicea.

Laodicea those situated to the N. of Mount Tmolus; for Strabo (pp. 579, 628, 630) informs us that Philadelphia, Sardis, and Magnesia of Sipylus, were, not less than Laodicea and the cities of the Mæander, as far as Apameia, at the sources of that river, subject to the same dreadful calamity" (*Geography of Asia Minor*, p. 253).

LAODICEA AD MARE. See **LATAKIA**.

LAON (*Landunum*, or *Lugdunum clavatum*), a city of France, and capital of the department of Aisne, stands on an almost isolated hill, commanding an extensive view over the surrounding plain, 74 miles N.E. from Paris. The town is surrounded by old walls and ramparts. Among its public buildings are the noble cathedral of Notre Dame, built in the twelfth century, and surmounted by two square towers; the church of St Martin, and the Hotel de Prefecture, established in the ancient Abbey of St Jean. There are also the Hotel Dieu, a library containing 20,000 volumes, and a college. Corn and wine form the staples of its trade, and woollen cloths, blankets, hats, and worsted caps are its principal manufactures. Laon is the see of a bishop. Under the early French kings it was a place of note, and was the last possession of the Carolingian dynasty. In 1411 it was captured by the Duke of Burgundy; the English took it in 1419, and lost it in 1429. In 1594 it surrendered to Henry IV.; and in 1814 it was the scene of the defeat of the French under Marmont, by the allied army under Blücher. Pop. (1851) 8043.

LAOS, a country in S.E. Asia, extending from N. Lat. 15. to 24., and E. Long. 96. to 103., bounded N. by China, W. by the Birman Empire, E. by Cochín-China, and S. by Cochín-China and Siam. Little is known of this extensive country, or its inhabitants, by Europeans. Numerous mountain-chains traverse it from N. to S., forming an equal number of valleys, through which the rivers flow. These rivers (the principal of which are the Saluen, the Mackhaun, and the Menam), from their frequent overflowings, form extensive tracts in the plains. The soil, however, in these level tracts is fertile, produces rice, cotton, tea, and other fruits, and is covered in many parts by extensive and luxuriant forests. The mountains contain gold, silver, iron, and copper, and some tin and lead have also been discovered. Of wild animals, the tiger and the rhinoceros are the most numerous. The history of the people is very obscure. About the end of the eighteenth century they were subject to the Birmans. Since that time, although yielding a nominal submission to China, they have been gradually regaining their freedom, and are now under a number of small native governments. Though speaking the same language, the various tribes differ considerably in civilization and character. The divisions of Laos are three—Upper Laos, the northern; Lactho, the middle; and Lanchang, the south-eastern part. Kemalatain is the capital of the first; Zaenmae, or Changmai, the capital of the second; and Lanchang is said to be the capital of the third. A considerable commerce is carried on by the natives with China, Burmah, and Siam. They export cattle, fruits, precious stones, gold, silver, cotton, wool, lac, rhinoceros' horns, ivory, benzoin, hides, and tiger skins, salt, and silk stuffs. The chief articles imported are iron-ware, sandal-wood, chintzes, opium, musk, and chowry tails. They have a national literature, and are Buddhists in religion. Except for the purposes of trade, they have little communication with foreigners.

LAPIDARY, a name given to the artist or artisan whose business it is to cut, grind, and polish gems, small stones, &c., for the purposes of jewellery, and also for mineralogical specimens. The name, derived from *lapidarius*, pertaining to stones (from *lapis*, a stone), would seem to include the various modes of working or finishing stones in general; the technical use of the word, however, is limited as above noticed.

Minerals differ greatly in the physical property of *hardness*; and this is so marked a feature, that a scale has been formed in which certain well-known minerals are arranged as standards of comparison; they increase gradually in hardness from No. 1 in the scale, represented by talc, which is very easily cut, to No. 10, the diamond, which nothing will cut. No. 2 is compact gypsum, No. 3, calc-spar; No. 4, fluor-spar; No. 5, apatite; No. 6, felspar; No. 7, quartz; No. 8, topaz; No. 9, sapphire.

Stones are usually cut or polished by means of harder stones, in the form of powder, applied to the edge, or on the surface of certain disks of metal, wood, &c., revolving horizontally, on vertical axes, and called *mills*. The annexed figure represents the lapidary's bench, consisting of a stout

plank, supported on a frame. The top is formed into two unequal compartments, and a rim rises above it to prevent the dispersion of the waste emery and water. In the compartment A is a hole and collar, through which passes the vertical spindle of the driving-wheel W, which is about 18 inches in diameter, and is worked by the handle represented in A. In the compartment B is another vertical spindle, carrying the mill M, which is 8 or 9 inches in diameter, and also the pulley P, which causes it to revolve by its connection, by means of a cord, with W. D is a square wooden rod, supporting a horizontal iron arm, in which the top conical end of the spindle works. At C is an iron support, called a *gim-peg*, or *germ-peg*, the use of which is to support the arm of the workman in grinding the edges of small stones, and also as a guide for the vertical angle in cutting facets, for which purpose a wooden socket C is slipped over the upper part of the peg, and held by a wedge, while holes or notches in the side of the socket enable the operator to place at the proper angle the stick S, upon which is cemented the stone to be cut.

Diamond powder is preferred as the cutting material, even where sand or emery might be employed. It does its work far more rapidly than any other material; it lasts much longer, it can be used with very thin plates, which not only expedite the process, but waste much less of the material in the cutting than thick slicers. Diamond powder is prepared from *dort*, as diamond fragments are called, or from imperfect stones; they are crushed in a mortar of hard steel, a process rendered easy by the brittleness consequent on the crystalline structure of the diamond. If not made sufficiently fine by this means, the powder is mixed with oil of brick, placed on a flat piece of iron, and worked with another piece of iron as a muller.

The slicer is of planished iron, 8 or 9 inches in diameter, and $\frac{3}{16}$ th of an inch in thickness. The diamond powder is formed into a paste with oil of brick, and is applied to

Lapis-
Lazuli
||
Laplace.

the edge of the slicer with a piece of stick or a slitted quill, and the particles of diamond are pressed into the iron with a piece of agate or flint applied to the edge. This *seasoning*, as it is called, will last several hours. The stone to be cut is applied lightly to the edge of the slicer, which, to prevent heating, is made to revolve with moderate velocity by turning the handle, shown in A; the slicer during the cutting being well supplied with oil of brick.

The flat surfaces produced in the above arrangement, which is called a *slitting-mill*, are ground upon what is called a *roughing-mill*, which consists of a lead lap, charged with emery and water. It is polished in the *polishing-mill*, on a lead or pewter lap, supplied with rotten-stone and water.

When a stone is to be worked into a definite shape, a pattern is cut out in card, and this being laid upon the stone, the outline is marked with ink. The stone is then roughly worked into shape by means of flat nippers of soft iron. The stone is then cemented to a stick, and the exposed portion is ground by holding the stick upon a flat mill, and imparting to the stone certain peculiar motions, which are well understood by working lapidaries, who produce rounded, elliptical, and other faces and edges, with surprising accuracy. The numerous forms of facetting are performed with the assistance of the gim-peg, as already explained.

Diamonds are, for the most part, cut at Amsterdam, where the steam-engine is used to give motion to the mills. (C. T.)

LAPIS-LAZULI. See MINERALOGY.

LAPITHES, in *Grecian mythology*, the son of Apollo and Stilbe, was the brother of Centaurus, and the husband of Orsinome, daughter of Euronymus. From him the descendants of his sons, Periphas and Phorbas, who dwelt among the mountains of Thessaly, were called the Lapithæ, and the name was afterwards extended to all the inhabitants of the country under their rule. The most notable event in their history was their quarrel with the Centaurs. See CENTAURI.

LAPLACE, PIERRE SIMON, MARQUIS DE, the greatest of recent physicists, was born March 23, 1749, at Beaumont, near Pont l'Évêque, in Lower Normandy. His father, a small farmer in the Vallée d'Auge, was too poor to send him to school, but some rich friends took an interest in the young scholar and sent him to the college of Caen, and afterwards to the military school of Beaumont. Though mathematics were at this time his favourite study, he seems to have paid a good deal of attention to theology. In his eighteenth year he went to Paris, furnished with introductions to D'Alembert and others. D'Alembert took no notice of his letter, till Laplace sent him an essay involving some of the higher principles of mathematics, when he invited him to his house, and shortly afterwards procured him a mathematical mastership in the military school of Paris. Laplace soon justified his choice by his papers read before the Academy of Sciences, of which, in 1773, he became an associate, and in 1785 a member. Before he was thirty years of age he had begun that career of discovery which only terminated with his life. It is not necessary here to recapitulate the details of his studies and their results, which are given in full in the PRELIMINARY DISSERTATIONS of Sir John Leslie and Professor J. D. Forbes. When the Revolution broke out, Laplace became ambitious of political distinction. In 1796 he was one of the deputation which, in presence of the Council of Five Hundred, swore eternal hatred against royalty. A little later he dedicated to this same body his *Exposition du Système du Monde*. On the return of General Bonaparte from his campaigns in Italy, Laplace paid his court to him and secured his admission into the Institute. His good will was rewarded at a later period with the portfolio of the interior. But, as Napoleon afterwards said, "he carried into government the principles of

the calculus," and managed matters so ill, that after six weeks of office it was found necessary to promote him to a sinecure in the senate. This occurred in 1799. Four years later he was made successively vice-president and chancellor of that body. Though he had sworn eternal hatred against kings and tyrants, he cheerfully took the oath of allegiance to Napoleon when he mounted the throne in 1804. His complaisance was rewarded with numerous honours. He received the grand-cordon of the Legion of Honour in 1805, the title of count in 1806, the cross of grand-officier of the Legion of Honour in 1813, with many other distinctions. Yet when his benefactor's power began to wane, Laplace was among the first who voted for the overthrow of the imperial throne, and the restoration of the Bourbons. He even displayed a spirit of pusillanimous ingratitude to his fallen patron. He had dedicated to him, in very fulsome terms, his *Théorie des Probabilités*; in 1814, on the downfall of the empire, he suppressed this dedication. Shame or remorse for this time-serving may perhaps have prevented him from visiting the Tuileries during the Hundred Days. It is all the more creditable to him, however, that he did not go, as he had been assured of a kindly welcome. He carried a somewhat similar spirit into his writings, in which he withheld nearly all mention of any who had preceded him in his own branch of science, though liberal enough of praise to the great names in other departments of inquiry. On this point, however, it is unnecessary to dwell, as it has been already discussed in Professor Forbes' DISSERTATION. In 1816 Laplace was named by Louis XVIII. president of a commission for the reorganization of the Polytechnic School, and in the following year became president of the Academy of Sciences. Before this date he had been elected a member of all the leading learned societies of Europe. At the time of his death, March 5, 1827, exactly a century after that of Newton, he had nearly completed his 78th year. The last words he was heard to utter were, "Ce que nous savons est peu de choses; ce que nous ignorons est immense."

Laplace.

The following list of Laplace's works is taken chiefly from *La France Littéraire*, by M. Quérard, and includes not only his separate publications, but also numerous memoirs, with which, during a period extending to rather more than half a century, he enriched the collections of the Academy and the Institute, and the Journal of the Polytechnic School:—

1. *Essai Philosophique sur les Probabilités*, Paris, 1814, in 4to. Another edition of this work was published the same year in 8vo, and the work was reprinted in 1816, 1819, and 1825. The *Essai Philosophique* is merely an abstract of the large work on the same subject.

2. *Exposition du Système du Monde*, in five books, the fifth edition, revised and augmented by the author, Paris, 1824, in 4to, and in two vols. 8vo. The first edition of this work appeared in 1796, in two vols. 8vo. In five books the author treats, 1st, of the apparent motions of the heavenly bodies; 2d, of the real motions of those bodies; 3d, of the laws of their motions; and, 4th, of the theory of universal gravitation. The fifth book contains an abridgment of the history of astronomy.

3. *Précis de l'Histoire de l'Astronomie*, Paris, 1821, in 8vo. This is merely the fifth book of the fifth edition of the *Exposition du Système du Monde*, published separately.

4. *Théorie Analytique des Probabilités*, third edition, revised and augmented by the author. The first edition of this work appeared in 1812, in 4to. From 1816 to 1825, M. de Laplace published four supplements, which the publisher, after having sold them for some years separately, added to the volume to which they now serve as a complement. These supplements treat, 1st, of the application of the calculus of probabilities to natural philosophy; 2d, of the application of the calculus of probabilities to geodesical operations; and, 3d, of the application of geodesical formulæ of probability to the meridian of France. The fourth contains an abridgment of the theory of probabilities.

5. *Théorie des Attractions Sphéroïdes, et de la Figure des Planètes*, Paris, 1785, in 4to. This is a memoir extracted from the collection of the Academy of Sciences.

6. *Théorie du Mouvement et de la Figure elliptique des Planètes*, Paris, 1784, in 4to. This work was printed at the expense of Pre-

Laplace. sident Bochart de Saron, who only caused 200 copies to be struck off. for the purpose of being distributed gratuitously.

7. *Traité de Mécanique Céleste*, in sixteen books, Paris, 1799–1825, in five volumes 4to, with four supplements published at different times. The first book treats of the general laws of the equilibrium of motion; the second, of the law of universal gravitation, and the motion of the centres of gravity of the heavenly bodies; the third, of the figure of the heavenly bodies; the fourth, of the oscillations of the sea and the atmosphere; the fifth, of the motions of the heavenly bodies around their proper centres of gravity; the sixth, of the theory of the planetary motions; the seventh, of the theory of the moon; the eighth, of the theory of the satellites of Jupiter, Saturn, and Uranus; the ninth, of the theory of comets; the tenth, on different points relative to the system of the world; the eleventh, on the figure and rotation of the earth; the twelfth, on the attraction and repulsion of spheres, and the laws of the equilibrium and motion of elastic fluids; the thirteenth, on the oscillation of the fluids which cover the planets; the fourteenth, on the motions of the heavenly bodies around their centres of gravity; the fifteenth, on the motions of the planets and comets; and the sixteenth, on the motions of the satellites. A second edition of the first two volumes of this work was published at Paris in 1829, 1830. In this country no attempt has yet been made, so far as we know, to translate the *Traité de Mécanique Céleste* into English; but, in 1830, an English translation of the first volume, with a commentary, was published at Boston, in the United States of America. Both the translation and the commentary are by Dr Bowditch of Boston; but the amount of the latter is out of all proportion to the text, being intended to enable persons but moderately skilled in the mathematics to comprehend the profound analytical investigations of the great astronomer, and to follow him to his beautiful and striking results.

8. Besides the works which we have just enumerated, M. de Laplace is also the author of a series of very important Memoirs, in which, from 1772 to 1823, he published the collections of the old and the new Academy of Sciences, that of the Institute, and the Journal of the Polytechnic School. The subjects of these Memoirs are exceedingly various. We give the following list in the chronological order of their impression, viz.:—1. On the Particular Solutions of Differential Equations, and on the Secular Inequalities of the Planets, 1772; 2. On the Integral Calculus, and on the System of the World, 1772; 3. On the Integral Calculus of Partial Differences, 1773; 4. On recurring Series, and their Uses in the Theory of Chances, 1774; 5. On the Probability of Causes afforded by Events, 1774; 6. On some Points in the System of the World, 1775 and 1776; 7. On the Integration of Differential Equations with Finite Differences, 1776; 8. On the Mean Inclination of the Orbits of Comets, id.; 9. On the Use of the Calculus of Partial Differences in the Theory of recurring Series, 1777; 10. On the Precession of the Equinoxes, id.; 11. On the Integration of Differential Equations by Approximation, id.; 12. On Probabilities, 1778; 13. On Series, 1779; 14. On the Determination of the Orbits of Comets, id.; 15. On Heat, id.; 16. On the Electricity which Bodies absorb when reduced to Vapour, 1781; 17. On the Approximations of Formulæ which are functions of very great numbers, 1782, 1783; 18. On the Figure of the Earth, 1783; 19. On the Births, Marriages, and Deaths at Paris from 1772 to 1784; 20. On the Population of France, and the Number of Inhabitants in the Country, 1783–1788; 21. On the Secular Inequalities of the Planets and of the Satellites, 1784; 22. Theory of Jupiter and of Saturn, 1787; 23. On the Secular Equation of the Moon, 1786; 24. On the Theory of Saturn's Ring, 1787; 25. On the Secular Variations in the Orbits of the Planets, id.; 26. Theory of the Satellites of Jupiter, 1788, 1789; 27. On the Theory of the Satellites of Jupiter, 1789; 28. On the Flux and Reflux of the Sea, 1790; 29. On the Determination of a Plane which remains always parallel to itself, in the movement of a system of bodies acting upon each other in any manner whatsoever, and free from all foreign action, 1798; 30. On Mechanics, id.; 31. On the Motions of the Heavenly Bodies round their Centres of Gravity, id.; 32. On the Secular Equations of the Motions of the Moon, of her Apogee, and of her Nodes, 1799; 33. On the Motion of the orbits of the Satellites of Saturn and Uranus, 1801; 34. On the Theory of the Moon, id.; 35. On Different Points of Analysis, 1809; 36. On the Motion of Light in Diaphanous Media, id.; 37. On the Approximations of the Formulæ which are functions of very great numbers, and on their application to Probabilities, id.; 38. On the Figure of the Earth, 1817; 39. On the Flux and Reflux of the Sea, 1818; 40. Addition to the Memoir on the Figure of the Earth, id.; 41. On the Developments of the true Anomaly, and of the Elliptical Radius Vector, in series, arranged according to the powers of the eccentricity, 1823. Lastly, the Marquis de Laplace contributed, in the mathematical department, to the *Leçons de l'École Normale*.

(See *Eloge Historique de M. le Marquis de Laplace*, by Baron VOL. XIII.

Fourier, in the *Mémoires de l'Académie Royal des Sciences de l'Institut de la France*, tom. x., p. lxxxii.; Quérard, *La France Littéraire*, art. LAPLACE; *Revue Encyclopédique*, tom. xxxiii., p. 880; *Edinburgh Review*, vol. xi., p. 249, et seqq., vol. xv., p. 396, et seqq., and vol. xxiii., p. 320, containing masterly criticisms on the *Mécanique Céleste*, the *Exposition du Système du Monde*, and the *Essai Philosophique sur les Probabilités*; and Dissertations Fourth and Sixth, prefixed to the present work.) (J. B.—E.)

Lapland.

LAPLAND, the most northerly country of Europe, is bounded N. by the Arctic Ocean, S. by Sweden, E. by the White Sea, and W. by Norway and the Atlantic Ocean. Its limits are not very accurately laid down by geographers; but it seems to be divided from the rest of Scandinavia by a line nearly corresponding with the polar circle, in latitude 66. 32., and is consequently almost entirely an arctic region. North Cape, its most northerly point, is situated in N. Lat. 71. 10. 15., consequently its length from N. to S. is about 330 miles. and not 500, as is usually stated. From Cape Orlov, on the White Sea, to the Atlantic on the W., it extends about 700 miles; but besides this continental territory, there are a vast number of islands, which are included in the general name of Lapland. The whole country is divided into three parts, called Russian, Swedish, and Norwegian Lapland or Finmark, and is recognised by the Swedes and Norwegians by the name of Lapmark, *mark* signifying, both in Swedish and Norse, land or tract of country. The very early writers, however, do not notice any country under the name of Lapmark, whilst Finmark is alluded to, though not with such clearness as would admit of our defining the exact extent of country which went by that appellation. It has been conjectured that, in former ages, the parts of the north now known by the names of Swedish and Russian Lapland were distinguished as Russian and Swedish Finmark previously to the period when the Finns obtained the name of Lapper, or Laplanders. Throughout Norway and Finmark they are uniformly termed Finns, which was their ancient and most proper designation; it is only in Sweden, and Swedish and Russian Lapland, that the name of Lap is given to the inhabitants of the country. They were called Lappes by Laxo in the twelfth century; but still the etymology of the word is thus very obscure, though circumstances seem to favour the supposition that the term Lap was applied to this race of people by their neighbours the Swedes, and hence was transferred to the country which they inhabited. In the old Russian annals they are always styled Lepori, a word most probably of Finnic origin. Finmark, which forms the most northern part of this wild and extensive territory, constitutes one extremity of the kingdom of Norway, to which it now belongs, though doubtless in ancient times it was a separate kingdom, governed by its own sovereigns. Its present boundary on the W. is Loppen, the first island in Finmark, and which forms a line between it and the Nordlands, a part of Norway sometimes erroneously confounded with Lapland. On the N.W. and N.E. it is washed by the Polar Ocean, whilst to the E. it is bordered by Russian Lapland, which also, with Nordland, bounds it to the S.; the boundary line between the two countries being the River Tana. Its extent from N. to S.,—that is, from the borders of Russian Lapland to the North Cape,—is nearly three degrees of latitude; its greatest breadth being from W. to E., namely, from the western side of Faroe to the coast above Waranger, near the borders of Russian Lapland. At the eastern extremity of Finmark there is a considerable tract, to which both Norway and Russia lay claim. It lies between the acknowledged boundaries of each of these powers, and being now considered as neutral ground, is free to the Laplander of both countries to hunt and fish in. This district extends a little to the westward of Bugefiord, stretching nearly S. to the Enara Lake, where it bends to the E., and afterwards to the N.E., where it joins the coast. Russian Lapland lies to the S. and E. of the debateable ground above

Lapland. mentioned. The river Muonio, which for a considerable portion of its early course receives the name of the Kōngärnälf, constitutes the boundary between Sweden and Russia. The circle of Kola, and the northern part of Eastern Kemi, constituted at one time Russian Lapland; but, by subsequent treaties, two extensive districts, all the Lapmark of Western Kemi, and the greater part of the Lapmark of Torneo, have been ceded to Russia. Thus nearly two thirds of the regions inhabited by the Laplanders are included in the dominions of the emperor of Russia. Swedish Lapland, the most southerly division, occupies the interior part of the country to the west of the river Torneo; the maritime district of Nordland, a portion of Norway, being situated between it and the North Sea. How much of the northern part of Sweden is entitled to be called Swedish Lapland, it is impossible to say. If the arctic circle be taken as the boundary line, only that portion of Sweden called North Bothnia can be considered as belonging to Lapland; but Pitea Lapmark and Umea Lapmark are sometimes mentioned as forming part of the latter country, and these are situated in West Bothnia. The cause of error may be traced to the circumstance of these nomadic tribes frequently inhabiting, at least for a portion of the year, districts of country far down in the interior of Sweden and Norway. Thus, in the latter country, the Roraas Mountains, situated between Christiania and Drontheim, are inhabited, during summer at least, by a family of Laplanders, with the never-failing herd of rein-deer. But the exact boundary line is not very material, as it has reference only to different portions of a tract of country which is under one government.

Mountains.

Lapland is not intersected by alps or very high mountains, as is sometimes asserted; but, from Nordland onwards, the whole region is a table-land, crowned only on its western frontier with a mountainous chain, which forms the extremity of the Scandinavian Alps, and descends from Sulitelma, of which the elevation is 6200 feet, to the height of Norwegian Finmark. These are about 3600 feet high on the continental coast, and nearly 4000 on some islands. The sea-coast presents a remarkably bold and rugged, if not magnificent appearance. Mountain is seen piled on mountain in stern grandeur, and white with the snows of ages; and the sublimity of the scene is enhanced by the myriads of islands which are scattered in an extraordinary manner along the Norwegian and Lapland coast, as far as North Cape. Ravines and valleys intersect the interior; the elevation of the highest plains has been estimated at about sixteen hundred feet, but towards the east and the south they descend. Rocks and hills rise from the table-land, varying, to the east of 18° west longitude, from 2000 to 2400 feet above the level of the sea, but only from 500 to 600 feet above their base. These hills are rather isolated groups than a continuous chain; and at twenty leagues to the south of them the streams and rivers separate in different directions between the North Sea and the Bothnian Gulf, and between the Gulfs of Alten and Torneo. The central ridge is supposed to descend without interruption to the entrance of the White Sea, and that part of Lapland consists of extensive marshes, studded with rocks. These have been called the Koelin Mountains, and, strictly speaking, may be said to form one great chain; but the branches which it casts off to the right and to the left, the mountainous isles of Lofoden, which are merely the summits of some of its branches, and the mountains which terminate near Lake Enara in Russian Lapland, entitle it to the name of a group. Other ranges of hills, which traverse Lapland, and are connected with Finland, are lost round the numerous lakes in that country. Sulitelma, already mentioned, is the highest mountain in Lapland. The islands of Waag and Hurd have each heights rising 4264 feet above the level of the sea; and a glacier on the island of Seyland is 4155 feet high. The mineralogical structure of the

Lapland Mountains has not been thoroughly ascertained. Lapland. M. de Buch informs us that the hills which he examined on the higher part of the table-land are composed of granite and gneiss. The latter rock is said to be by far the most abundant in Scandinavia, all the other primitive rocks appearing in some degree subordinate to it. Quartz is very abundant on the island of Mageröe. On the Dovrefield, and other mountains, it is met with in scattered blocks; but at the North Cape the surface of the ground is wholly covered with it. M. de Buch also observed, in an excursion which he made towards the Gulf of Bothnia, a succession of calcareous and schistose rocks. These substances likewise abound in the country between the last-named gulf and that of Kandala. The land is intersected with ravines, but its elevation is inconsiderable. The whole region is supposed to rest on a base of red *decomposable* granite, or, as it is generally called by the natives, *rapakivi*. There is abundance of metal found in Lapland, particularly iron, of which whole mountains exist in that part of the country belonging to Sweden. Copper, lead, zinc, silver, and even traces of gold, have been found; but iron ore is the chief mineral treasure of the country, and might assist in introducing cultivation and an extensive trade into this desert portion of Europe, did not the scarcity of timber, and the great difficulty of conveying goods, constitute insuperable obstacles to the working of the mines in the inland and eastern parts of the country, where it would appear to be most abundant. The marshy lands are impregnated with this valuable metal, and in gneiss it occurs in beds which are sometimes nearly forty feet in thickness. Numerous minerals are found in Lapland; rock crystal in particular is very common, and the inhabitants occasionally dispose of it for amethysts and topazes.

There are numerous lakes and rivers in Lapland. Of Lakes, the latter, several take their rise in the Koelin Mountains, rivers. and flow in various directions into the Atlantic Ocean or the Gulf of Bothnia. The principal rivers of the country are the Tana or Tarna, which takes a north-eastern course through Finmark, and empties itself into a bay or sound of the same name; the Alten or Alata, which is very rapid, forcing its way through the mountains of Finmark in a north-westerly direction, empties itself into a bay of the same name; the Torneo, which issues from a lake so named, and, after being enlarged by a number of streams uniting in one channel and running nearly due south through a long course, falls into the northern extremity of the Bothnian Gulf at Torneo; and the Muonio, which rises from the Killpis Jaure, at the foot of the alpine chain of Norway, is a considerable stream, and constitutes the boundary line between Sweden and Russia, till it unites with the river Torneo, when the latter marks the limits of either country in this quarter. There are also other rivers which take their rise in Lapland, and fall into the Gulf of Bothnia, such as the Lulea, Pitea, Kalix, and others. In Russian Lapland there are several considerable streams, but these have not been so well defined, nor has this part of Lapland been so fully described, as the others. The Kemi takes its rise amongst the Kemi Mountains, situated near the centre of the country, and flows into the Gulf of Bothnia. It has many imposing cataracts, of which the *Taival Koski*, or the fall of the heavens, is the only one which the adventurous boatmen never attempt to cross. The *Passe*, or holy stream, is the outlet of the great lake Enara, flowing thence to the Arctic Ocean. The eastern declivities of Russian Lapland are watered by the Panoi, which discharges itself into the White Sea. The Tuloma falls from a great height, enters the lake Kola, which name it afterwards takes, and falls into Kola Bay, on the Arctic Ocean. Besides these, there are numerous other rivers which traverse the country in various directions, and either give rise to lakes, or issue from them. The abundance of

Lapland. lakes is the most prominent feature of Lapland, as it generally is of all countries situated in such latitudes. Sometimes these sheets of water occur singly, sometimes in chains, and many of them are of considerable size; but there exists such a confusion of nomenclature, that it is difficult to distinguish one from another, and apply to each its proper designation.¹ Very often the rivers, such as the Muonio, become so broad in some parts, as often to assume the appearance of lakes, and there is little doubt they have occasionally been so termed. The most considerable lakes are, the Enara, in Russian Lapland, which is about forty miles in length by sixteen in breadth; the Imandra, which has an elevation of four hundred feet above the level of the sea, and is discharged into the Gulf of Kandala; the Biggi Lobe, and Biggi Jaure, one or other of which, Sir Capel Brooke supposes, is that designated by Von Buch the Jess Jaure; and many others which do not require to be enumerated. Besides these inland bodies of water, the shores are indented by extensive *fjords* or arms of the sea, which frequently run thirty, or even forty miles into the heart of the country.

Vegeta-
tion.

Finmark and Swedish Lapland, including all the modern provinces belonging to Russia, have been carefully examined by Wahlenberg and Von Buch, and the vegetable kingdom distinguished into six zones, concentric with the Gulf of Bothnia, each differing from the others in climate and productions. The first or lower region of the forests rises from the level of the sea to the height of five hundred feet, forming a zone generally eighty miles in breadth; and here the spruce and Scotch fir abound. The second is higher and colder than the first, rising from five hundred to eight hundred feet, and being generally only from six to eight miles in breadth. This portion has been denominated the upper region of the forests, and here the Scotch fir is still found, but the other plants disappear. The third is higher than any of the preceding, rising from 800 to 1200 feet, and for the most part about twelve miles in breadth, excepting at one place, where this becomes very great. The fir here is rarely seen, but pines are abundant. The fourth or subalpine region, rising from 1200 to 1800 feet, is a zone of about the same dimensions as the preceding, and contains birch, but coniferous trees do not grow there. The fifth is called the alpine region, or the country of the dwarf birch; and the sixth, which is the highest and most northern of all, varies in breadth according as it is indented by the sea. It is the region of perpetual congelation and eternal snow, producing no trees, and scarcely any vegetation whatever. The vegetable scale in Norwegian Lapland has been marked by Von Buch. The following table is intended for seventy degrees of north latitude:—Limit of the red pines, 730 feet; of the birch, 1483; of the *vaccinium myrtillus*, 1908; of the dwarf birch, 2576; of the *salix myrsinites*, 2908; of the *salix lanata*, 3100; and of perpetual snow, 3300. The species of plants which constitute the *Flora Laponica* are not numerous, but they abound in individuals, and the vegetation here is decidedly superior to that of the other countries round the Frozen Ocean. Mosses and lichens cover the plains and rocks which are elevated more than a thousand feet; and were the inhabitants more industrious, these might be rendered useful as dye-stuffs. The rein-deer's lichen is of a bright yellow colour, which, however, is fugitive, the yellow giving place to white as the plant dries or withers. The mosses

and lichens constitute the food of the cattle, and from a species of the latter a wholesome and nutritious flour is extracted. The rocky country is the region of these cryptogamia. The *rubus chamaemorus*, and the *vaccinium myrtillus*, occur in the neighbourhood of the extensive marshes; but reeds or aquatic plants are found on the banks of lakes or rivers. A plain surrounded by rocks, and covered with moss and other alpine herbage, forms a Lapland meadow. Rein-deer moss is quite indispensable to the Laplander's herd. It is hardly to be met with on the Finmark coast, but on the continent it is found in abundance, though not so plentifully as in the interior parts. It thrives best in a flat extent of low ground, consisting of morass or forest well saturated with moisture. On this account Finmark, which is rocky and mountainous, does not abound so greatly in this moss as the level plains and morasses of Russian Lapland, where it grows in the greatest profusion, immense tracts of country being wholly covered with it. Of trees, twenty-six kinds have been enumerated, including the *salices*. There are no less than nineteen species of willows; the others consist of Scotch and spruce fir, birch, alder, poplar, mountain ash, and bird cherry. Apples, pears, plums, and cherries, scarcely grow at all, although carefully cultivated; but considerable varieties of berries are spontaneously produced, amongst which are black currants, and raspberries of an exquisite fragrance. It may be stated, that in Swedish Lapland the vegetable productions bear a nearer resemblance to those of Siberia than the plants of the western part of Lapland, which, towards the sea, are analogous to those of Scotland and Iceland. The most abundant indigenous vegetables are the sorrel, which is prized on account of its antiscorbutic properties; the angelica, a highly-relished article of food; and the *lichen rangiferinus*, the staple of the rein-deer during winter. Towards the south are gardens in which the vegetables of the temperate zone are cultivated; and various flowers, including roses, carnations, and the like, also adorn these enclosures. Potatoes reach the size of poppy-heads (those of Finmark are very sweet, and of a waxy consistency); French beans, broad beans, and tobacco, where care is taken with it, are raised, but neither peas nor white cabbage come to perfection.

With respect to the climate and vegetable productions of Alten, Sir Arthur de Capel Brooke observes, "in speaking of its horticulture, it might be supposed that the produce of a country under the latitude of 70° would be extremely scanty. This, however, is not the case. Most kinds of vegetables succeed perfectly well, and are cultivated in sufficient abundance for the wants of the inhabitants." This traveller then proceeds to mention the cultivation of the potato, which is raised to some extent in Finmark.

Most of the wild animals common to Norway and Sweden are found in Lapland. Bears are numerous; and though the rein-deer evades destruction by the rapidity of its flight, yet cows, goats, and sheep frequently fall victims to their rapacity. These animals are extremely partial to a certain kind of berry which is abundant in the country; but they likewise feed on grass. Wolves and foxes are plentiful, and the former are likewise very destructive to the tame animals; the skins of the latter are much prized in the north of Europe. The glutton, which is strongly furnished with teeth, as well as very sharp

Lapland.

Animals.

¹ Much confusion exists regarding the names of places and things in Lapland, and every writer must experience difficulty and be exposed to error in describing any portion or feature of that country or its inhabitants. Mountains, lakes, and rivers have frequently, indeed in almost every instance, more than a single appellation assigned to them; so that what is called by one name in any given work, will be found described under another designation in every other. This is particularly the case with regard to rivers, which, from their source to the sea, sometimes change their names two or three times.

Lapland. nails, is common; and its skin, on account of a white shining streak with which the neck is marked, is held in great estimation. In the woods the glutton frequently surprises the rein-deer, by suddenly descending upon it from the branch of a tree, and killing it by mangling the neck with its teeth. Otters of different kinds, ermines, a species of white weasel, squirrels whose skins are beautiful and much valued, the *mus lemmis*, a species of marmot peculiar to the country, and field-mice in vast numbers, are all natives of these high latitudes. The beaver is found in some parts, but seldom on the rivers. The wool and the skin of this animal are marketable commodities. Hares are bred in great numbers; and they are distinguished by the striking peculiarity of changing their colour from gray to white during winter. Coverlets are made from their skins. There are three species of martens found; the *steen-maar*, which inhabits the rocks; the *birfe-maar*, which makes the birch-tree thicket its home; and the *furr-maar*, which haunts the fir-trees. There are said to be a few elks, but of wild rein-deer the number is very great. From these to the individuals of the race which have been domesticated, the transition is natural. The most valuable part of a Laplander's possessions, and the chief object of his care, is the rein-deer. It unites in itself the best qualities of almost every other animal which has been found essential to the comfort of man in other countries to which it is a stranger, being at once the horse, the cow, the sheep, and the stag of Lapland. Its milk is so rich as to require being diluted before it is used. Its flesh is superior to that of the sheep; and, from its tractability and natural power of endurance, it drags the sledge of the Laplander with extraordinary speed and perfect safety over the desolate and chilling regions of snow which he inhabits. It is, moreover, easily maintained, finding its food, the favourite moss which goes by its name, amongst the frozen wastes during winter with perfect ease. These animals are also said to feed on frogs, snakes, and mountain-rats, and to be very partial to human urine, which they lick up with avidity whenever it comes within their reach. But the possession of this invaluable quadruped is very uncertain, for the wandering herds sometimes disperse themselves in the woods, from which it is difficult for the shepherd to dislodge them. They are, besides, not easily milked, and yield but a small quantity at a time, so that a large flock is necessary before the head of a family can be supplied with a sufficiency of food and milk. In shape they resemble stags; and their hair, at first gray, becomes blanched before it falls off. They cast their horns annually; those of the male are often two feet and a half in length, and their points are frequently as far asunder. They are generally four feet in height from the foot to the top of the back; and the length from the shoulder to the tail is two feet. A crackling noise is heard when they walk, which is asserted by some writers to result from the hoofs striking together when the foot is raised, but there are other opinions upon this subject.

The rein-deer is subject to various diseases from which other animals appear to be exempt, and during summer they are attacked by the *æstrus tarandi*, a large kind of bee, whose eggs, deposited in the skin, produce ulcerations not unfrequently destructive to the fawns. This great enemy of the rein-deer will pursue it for many miles; and in hot weather the Laplander takes a journey of some hundred miles to the sea-coast, principally for the purpose of avoiding its attacks. The *æstrus nasalis*, another tormentor of the rein-deer, makes small punctures within the nostrils, and there deposits its eggs. It is a singular fact, observed by Sir Arthur de Capel Brooke, that the rein-deer increases in size the farther north it is found. Cows, sheep, goats, and horses, have been naturalized in Lapland; but the management of these animals,

together with other particulars regarding the rein-deer, **Lapland.** we will afterwards have occasion to recur to.

Of birds there are many found in Lapland which are **Birds.** unknown in other countries, such as the Lapland woodcock, the Swedish mock-bird or nightingale, called, from its melodious notes, "the bird of an hundred tunes," together with a peculiar species of the owl, magpie, woodpecker, woodcock, and others of the feathered races. Flocks of birds of passage resort to Lapland during summer for the purpose of breeding, amongst which may be enumerated the eagle and falcon tribe, owls larger than common, and occasionally white, crows or rooks in great numbers, ravens, partridges, large bustards, magpies, pigeons, plovers, ptarmigans, swans, wild geese, eider ducks, cocks of the wood, varieties of grouse, curlews, and various other feathered frequenters of the field or lake. Only a very few species of birds remain during winter, there being little subsistence for them in such chilly wastes of snow and ice. Common frogs and lizards are the only amphibious animals found. No venomous animal is to be met with in Lapland, but insects are in hot weather as numerous and annoying as in tropical climates. Besides the two already mentioned, the interior forests of Lapland swarm with gnats, which attack both man and beast with the greatest fury. The rivers abound in excellent salmon, and the lakes in perch, pike, trout, char, and other fish. The seas are also well replenished with the finny tribes, such as cod, tusk, and ling; and whales, particularly that species called the fin whale, so difficult to be captured, abound upon the Lapland coast. These enormous animals are very plentiful about Cape North; and Sir Arthur Capel Brooke was informed by the Laplanders that they are extremely partial to cows and horses, and will pursue a boat in which these are until they are landed.

The climate of Lapland is of course very cold, but it **Climate.** is milder than that of any other region on the same parallel, the coasts of Siberia, for instance. The temperature of the air is regulated by the height above the level of the sea, and the distance from the Gulf of Bothnia, and may be divided into two regions, the inland and the maritime. It may be laid down as a principle which generally holds true, that in the former the winter is severe and the summer hot, whilst in the latter the winter is comparatively mild and the summer cold. An open and ever agitated sea is one great cause of the mildness of temperature which is experienced on the northern coasts of Finmark; but the maritime climate is much colder on the other side of Cape North, and the harbours on the coast of Eastern Lapland are sometimes blocked up in the middle of June. In the inland parts the summer is short; but in the sixty-six days during which there is no night, the crops are sown, ripened, and reaped. At this time the enlivening songs of birds are heard, and the earth is in some places covered with flowers. There is no darkness, and the coolness of evening is never felt. The heat is thus very oppressive, particularly in confined places, such as valleys. At this time insects are exceedingly troublesome. Acerbi, a traveller in Sweden and Lapland, found the degree of heat fifty-two of Fahrenheit in the shade, and eighty-one in the sun. The ground was so hot as to give uneasiness to the feet, whilst it oppressed the lungs; and the shrubs which were met with at distant intervals afforded little or no shelter to the traveller. In various parts of Lapland the days during summer are in brightness, geniality, and serenity, equal to those of more propitious latitudes, and both delightful and healthy. Von Buch found the mean temperature of the month of July nearly sixty-three degrees at Altengaard, in north latitude sixty-nine degrees. In winter the cold is so excessive, that mercury, and even brandy, frequently freeze

Lapland. in the open air. All the lakes and rivers are covered with ice of great thickness, and the whole face of nature is buried beneath a sheet of snow several feet in depth. During the winter solstice the sun continues seven consecutive weeks below the horizon, when only a partial twilight prevails; but this "darkness visible" is to a considerable extent compensated by the superior brightness of the moon and stars, and the vivid beams of the aurora borealis, the light of all these luminaries being augmented by the whiteness of the snow, which keeps up a perpetual reflection from the earth's surface. Thunder storms sometimes occur during the depth of winter. When a thaw comes on, the atmosphere is filled with vapours; but during the prevalence of the north wind the air is clear and the sky is serene.

Vegetation depending more upon the heat of summer than the cold of winter, Enontekis is superior to the North Cape in bringing the productions of the ground to maturity, notwithstanding that the mean temperature is lower, because the heat during the summer is higher at the former than at the latter place. The covering of snow here also, as elsewhere, serves to retain the heat which the earth has imbibed during the warmer months, and preserves it in a better state for vegetation. At Enontekis the snow continues on the ground from October till May, whilst at the North Cape, being open to the sea-breezes, it is exposed to frequent thaws; nor is it likely, under such circumstances, it can ever lie so deep. On some of the inland elevations, particularly in Finmark, if the summer be very cold, it lies during the whole year, and entirely prevents vegetation from making its appearance, with the exception of some of the *cryptogamia*.

Agriculture.

The soil of Lapland is generally sterile. The greater part of the country is covered with rocks or moss, or gravelly plains, or a kind of turf composed of mosses decayed by the frost, and impregnated with standing water. There are a few tracts of tolerable soil, especially in the more southern districts. The agriculture of Lapland is hence very trifling, for the soil yields but a very inadequate return for the labour which the hardy native bestows upon it; and in general he finds a more ready means of supplying himself with what he requires, by barter with the Russians. The following quotation, however, from Sir Arthur de Capel Brooke, presents a more favourable view of the climate and its productions than might have been anticipated. After mentioning the culture of the potato, already alluded to, and which is likely to be very beneficial to the country, as rendering it less dependent upon Russia for a supply of bread corn, he proceeds: "To this it may be added, that barley and rye are cultivated to some extent in parts of Finmark, particularly at Alten, although no agriculture is carried farther north; and this circumstance alone would induce us to form no unfavourable opinion of the climate of a place situated near four degrees beyond the polar circle. The Scotch fir, too, reaches Talvig in seventy degrees; and the *moltebær* (*rubus chamæmorus*) flourishes to the very verge of the North Cape, in 71. 10. 15. where the winter night is ten weeks in length."

Origin of races.

Much obscurity veils the origin and early history of the inhabitants of Lapland. The Samoyedes, Esquimaux, Greenlanders, and Laplanders, appear to have been originally the same people. The more immediate ancestors of the latter were probably the ancient Finns, for the description which Ptolemy and Tacitus give of the Finni exactly corresponds to that of the highland Laplanders of the present day. There is also a race of people inhabiting Finmark, quite distinct from the Laplanders, called the Quäns.

Professor James D. Forbes, who visited Finmark in 1851, thus speaks of the Quäns:—"A stranger has some diffi-

culty to understand their relation to the Laplanders, with whom they are easily confounded, both being often called Finns. It is, indeed, in Finmark itself that the Lapps are most frequently, but inaccurately described as Finns. The Quäns, however (who, like the Lapps, are foreigners), properly come from Finland, whilst the Lapps belong principally to the opposite or western side of the Gulf of Bothnia. Their appearance (excepting, however, their dress), their habits, and even their language, are essentially distinct; the Lapp is dwarfish in the extreme, and the form of the countenance resembles that of the Tartar tribes. The Quän, or Finlander, or Esthonian, with some features in common, is moderately tall, and has a skull more of the usual European type. Their habits are absolutely diverse: the Quän being domestic and fond of agriculture, the Lapp essentially nomadic and incapable of steady labour; so much is this the case, that some writers consider the distinction as referring rather to occupation than to race. Of the capacity of the Quäns some difference of opinion exists. Von Buch considers them to have done much more for Finmark than the Norwegians themselves, and that they are even now its most civilized inhabitants, and by far its best agriculturists. The report of the Alden Company's officers is less favourable; but it is quite possible that mining industry is unsuited to their tastes and habits. The language differs as much from the Lappish as Swedish does from the German. Though their costume is similar, their houses, substantially built of logs, are roomy, comfortable, and of course permanent, unlike the Lapps. The appearance of the Quäns in Norway is believed not to date earlier than the commencement of the last century. They are stated by Von Buch to have been driven out of their native country by the wars of Charles XII."

The Finmark Laps have been divided into two classes, the fishing or Shore Laplanders, and the rein-deer or Highland Laplanders. From their different habits of life, there is a marked distinction between the two; and there is yet another class of poorer Laplanders, who are numerous in all parts of Swedish and Russian Lapland. These are called *Shogslapper*, or Wood Laps, dwelling almost entirely in the wooded parts of the country, their herds of deer being too small to enable them to live in the mountains. During summer they live in tents; in winter they construct sod-huts, resembling the *gammies* of the coast Laps.

This kind of Laplander is unknown in Finmark, the country being mountainous, and nearly destitute of forests. The mountain Laps of the latter country are for the most part wild and savage, both in appearance and habits. They exhibit a degree of haughtiness and proud independence of spirit, which is wanting in individuals of the race who inhabit the plains of Russian Lapland or the shores of the northern coast. Until softened by a present, they are surly and morose in disposition; and their suspiciousness of temper detracts much from any hospitality which is apparent in them. The stranger must therefore remove this natural mistrust of the Lap before he can expect to receive from him any attention; and brandy, above all things, is the most potent softener of his feelings. This, or a present of tobacco, is so efficacious as to render him quite a different person, and willing to perform any service to the donor.

The dress of the mountain Laplander of Finmark does not materially differ from that of the inhabitants of other parts of Lapland. In winter they are entirely clothed in rein-deer skins, consisting of a *pæsk*, or frock of rein-deer fur, or, what is more common, a *muadda* or sheep-skin garment. This is belted up by the leathern girdle (*buagan*), to which is suspended the knife, the tobacco pouch, and shooting apparatus when they follow the chase. The first is a long knife, not unlike that of a butcher, the handle of birch root, and the blade of great substance and strength.

Lapland.

character.
&c. of the
people.

Lapland. The driving *pæsk* is composed of the thickest and best skins his deer afford; and, as a further protection whilst travelling, a broad bear-skin tippet covers the shoulders, and reaches nearly as low as the elbows. The lower part of the dress consists of the *bællinger*, a sort of loose spatterdashies or leggins, which, being drawn over a pair of long, loose deer-skin pantaloons, reach from the ancles high up the thigh. These are whole, and fastened or tightened at the top by a running string, and covered over at the bottom by the *skallkomager*, or high rein-deer shoes, and the *komager baand*, which is a long, narrow band, going several times round the ancle, keeping the whole tight together, and preventing the possibility of any snow from getting in; for the upper parts of the *bællinger* are of course covered by the *pæsk*, which, when girded up, reaches just below the knees, but, when loose, falls down nearly to the ground. In summer, the heat of the weather compels them to make an alteration in their dress, and the rein-deer *pæsk* is exchanged for a round frock of wadmal cloth. This *gappe* or summer frock, which is generally made of the skins of young deer, extends below the knees. On the head is worn a small low cloth cap (*gappir*), turned up all round, with a facing of fine rein-deer fur. No shirt is worn next the skin, linen being a luxury with which the Laplanders are entirely unacquainted. The use of stockings is likewise unknown, but a substitute is found in the soft dried grass called *sena*, with which the shoes are well stuffed. The hands are protected by rein-deer gloves, or rather mittens, being without fingers, but stuffed with the same kind of grass as the shoes. Almost every part of the winter dress of the Laplander is thus furnished by the useful animal which is the companion of his wanderings. The *pæsk* is made from the whole hide of the deer killed during winter; the *bællinger* and gloves, of the skin covering the legs and thighs of the animal; and the shoes are taken from the skin between the horns, and covering the crown of the head. The fur is worn on the outside, and, from the peculiar closeness and thickness of its texture, it is impossible for the cold to penetrate it. Every part of a Laplander's dress is worn loose, and thus the blood is allowed to circulate freely, an advantage which could not be enjoyed were the clothes tight on the skin. The dress of the coast Laplander is entirely similar to that of the mountaineer, except that when the weather is not warm, he usually wears a sheep-skin garment called *muadda*; and the wool being next the skin, it is rendered nearly as warm as the rein-*pæsk*, though this also he commonly wears in winter. The former, however, being the produce of his own flock, and made up by himself, is naturally in more general use. The rein-deer skins are obtained by barter from the highland Laplanders, and being made into garments by the inhabitants of the coast, who are expert at this kind of work, are again sold or exchanged for silver money, or the necessities they may require. The women have some skill in embroidery, and collars and cuffs of the wadmal dresses, both male and female, exhibit their taste in the art of adorning. The dress of the females very much resembles that of the men. In winter a frock or *pæsk* of sheep-skin, worn with the woolly part inside, is bound to the waist by a belt, to which a small knife is suspended. In summer the sheep-skin frock is exchanged for one of wadmal cloth. The cap is sometimes made of various kinds of cloth, and it is usually encircled by a ribbon. The fondness of these people for anything gaudy is very conspicuous in their summer dress, for the necessities of winter compel them to keep it more unvaried. During the hot months the Lapland costume is very picturesque, from the variety of colours combined in it. It is then, particularly on the sabbath-day and on holidays, that he shows his pride, by making his appearance in all the finery that his means will afford. The usual colour of Lapland. his *koften* or daily frock is white, with several edgings of blue and red cloth round the bottom and cuffs, but his Sunday garment is of a more ornamental nature, and frequently of thin cloth, richly embroidered in party colours round the cuffs and collars. In some parts of Lapland *koften* of black cloth are met with, and those that are wealthy sometimes array themselves in scarlet ones. On extraordinary occasions, other parts of their dress are also of a finer nature than what is commonly worn. As may be supposed, even the best species of cloth which finds its way to these regions, is of a very inferior quality; it is chiefly of German manufacture, although cotton from England is also found here. Those of the women who can afford it, adorn their persons with rings, and ribbons of the gayest colours flutter around their bonnets. Like the Greenlanders, and other inhabitants of high latitudes, females wear pantaloons like the men, a practice which was in all probability had recourse to for personal comfort, in regions where open garments would have unnecessarily exposed the body to the cold. It may be mentioned, that the dresses of the families of the merchants who live on the coast are very superior, in point of elegance, to the garments of the native Laplanders.

The difference of character between the highland and coast Laplander has already been adverted to. The former is known by his haughty expression of countenance, and proud independence of demeanour. The more domestic habits of life of the coast Laplander, render him a more quiet and inoffensive being, and give to his features a milder and a somewhat vacant expression. Speaking of the Laplanders in general, they must be considered as a diminutive race, though not such pigmies as is commonly supposed. The Norwegian Laplander is superior in stature to the rest of the race, and this difference is probably to be attributed to the freer and purer air of his mountains rendering him more hardy and robust. The average height of the highland Laplander may be considered as varying from five feet to five feet two inches. They sometimes, but very rarely, exceed this stature. The characteristic features of the race are small elongated eyes, high cheek-bones, wide mouth, and a pointed chin, with little or no beard. Their hair is generally brown, or dark coloured. Their bodies, from their habits, are naturally spare, and devoid of corpulence, though in general they are ill made. They are bony and muscular, possessing greater strength than their stature would seem to indicate, active, and capable of enduring almost any fatigue. Their hands and feet are remarkably small; their voice is weak, and its tones have a squeaking effect upon the ear of a foreigner. In their moral character the Laplanders exhibit some marked peculiarities. Their passions partake of the torpor of the climate, and flow in a slow, cool, and regular course, unbroken by those sudden ebullitions and transports which characterize the men of warmer latitudes. Love, or the amatory feeling, is but a lingering spark, only sufficient to answer the purposes of nature. They possess in a remarkable degree the virtue of continency, and the conjugal relation is rarely or never violated, although both their parental and filial affections are weak. Anger and bloodthirstiness are unknown to them; and Sir A. Capel Brooke found, in 1823, that, during the space of twenty years, only one murder had been committed in Finmark. Although they are generally cautious, mistrustful, and suspicious, especially of strangers, as well as cunning in their commercial dealings, yet theft is almost unknown amongst them. The absence of this vice is proved by the fact, that locks, bolts, and other safe-guards, are considered as unnecessary appendages to a door. They have been accused of avarice, but without any just reason; for whatever strictness they may

Lapland. observe in bargain-making does not arise from a wish to hoard up money, but that they may be more bountifully supplied with their favourite beverage, brandy, of which they are excessively fond. Drunkenness is not only common, but may be said to constitute a feature of their character. In temper the coast Laplander is of a kinder nature than the mountaineer, and he is more inclined to hospitality, although this virtue is by no means very conspicuous in either. They are generally passive, without much courage, and altogether of a very peaceable and inoffensive disposition. They now exhibit little of a warlike spirit, although in former ages they were frequently the cause of terror to the Norwegians. Notwithstanding their ebriety, health is a blessing which the inhabitant of Lapland enjoys in a high degree. They were formerly addicted to degrading superstitions; and the witchcraft in particular which was exercised amongst them has passed into a proverb. Milton alludes to this circumstance when he speaks of dancing "with Lapland witches." They were famous for their empire over the winds, which they disposed of in bags to the credulous mariners. In performing their infernal rites, the instrument used was the magical drum, by beating which as an accompaniment to other ceremonies, they fancied they had the power of foretelling future events, curing diseases, and exorcising evil spirits. Their mythology was distinguished by an universal idolatry, in which the elements were typified, and a polytheism, by which every object in nature was changed into a god. But on these wild creations of the human mind in a state of ignorance and barbarism it is unnecessary to dwell. The rites by which the worship of their deities and idols were celebrated are now unknown, being supplanted by those which have their origin in the milder and purer genius of Christianity.

Habitations,

The habitations of the Laplanders now demand description. The mountaineers live in tents, which differ in no respect in summer and winter, and are of very simple construction. They are formed by six beams of wood rising in a pyramidal form, and meeting nearly at the top, covered with thick and coarse cloth, a flap of which, left loose between two of the beams, constitutes the door. The height of the tent is generally about six feet, and the whole circumference of the inside seldom exceeds fifteen or eighteen feet. The floor is strewed with rein-deer skins, having the hair upwards, and which thus serve for either lying or sitting on, the tent being too low to permit of the occupants assuming the erect posture, except in one place. A stone frame is made in the middle for the fire, and there is a hole at the top to which the smoke must find its way; but its speedy egress is by no means considered as necessary to comfort. The fumes thickly impregnate the whole tent, as well as "all which it inhabit;" a species of jappanning highly valued, as affording a protection in winter against the cold, and in summer against the swarms of musquitoes. Cabined and confined in this limited domicile, it is here that the Laplanders, seated on their heels in the manner of the eastern nations, or squat like toads, spend in all the beatitude of idleness the moments which they can spare from their pastoral avocations. The different provisions are kept in boxes attached to the stakes; and boxes are ranged on the inside round the cloth or covering; but these precautions are often unavailing against the impetuosity of the blast, whilst the thinness of the tent naturally exposes the inmates to the severity of the weather. In regard to habitation, the shore Laplanders have a decided superiority over those of the mountains. The gammie or hut of the former is usually about five feet in height. It is generally of a circular or oblong form, having the appearance of a large rounded hillock, which name it may be said to deserve, being composed of turf laid on branches of the birch, and supported underneath by a

wooden frame-work of stronger materials, to bear the weight of the whole. The entrance is by a low, narrow passage, at the extremity of which is the door communicating with the part inhabited. Around them are generally enclosures for the cattle, and several racks of coarse fodder for their winter food. The farming stock of the coast Laplander consists of a few sheep, and sometimes a cow or two, which are kept in the enclosure during the summer season, and in winter occupy the same buildings with their owner, being supported during the latter partly by the coarse fodder which he has been able to collect, but chiefly by the remnant of his fishing produce.

Necessity has rendered the highland Laplander a wanderer, and habit has made that mode of life a second nature to him. It is upon the rein-deer that he almost entirely, if not altogether, depends for subsistence; and hence their welfare is the chief object of his care, in promoting which he is compelled annually to take long journeys to the seashore for the purpose of avoiding the attacks of insects. His habits of life are thus in a great measure formed; and the year is divided between his abode on the mountains and his migrations to the coast, whilst his life as a whole consists of the extremes of bodily fatigue and total inaction, plenty and want. When he is hungry, and has the power of gratifying his appetite without restraint, he is perfectly ravenous, and devours a quantity sufficient to support him for several days. Those who inhabit high latitudes, where subsistence is precarious at certain seasons, seem all to have a remarkable capacity of stomach, and to be capable of eating an enormous quantity at a meal, so as to serve them for five or six days, without being annoyed by the load. The necessities of their situation have compelled them to practise this frequently, and custom has rendered it easy. The Laplander's household economy, it may readily be imagined, is simple in the extreme. His food during the period of his summer rambles is spare and frugal, and without any indulgence in rein-deer venison, his favourite food and the luxury of the winter season. In summer he is intent only on increasing the number of his flock, and on providing against his future wants. He contents himself then generally with milk, and the remains of the curd and whey after making his cheese. The first is taken sparingly, on account of the small quantity which a single deer yields, as well as of the great importance it is to him to secure a good quantity of cheese for his winter stock, and to guard against any disaster that might befall his herd and reduce him to want. As he milks his herd during the summer season only, when this approaches a close, some milk is generally preserved for the purpose of being frozen. This serves not only for his own individual use during the winter, but, being highly prized for its exquisite delicacy in this state, it constitutes an article of trade; and the merchants with whom the Laplander deals, and who then repair to the interior, gladly purchase it at any price. Though the rein-deer milk is thus of a very rich quality, yet the cheese made from it is extremely bad, and unpalatable to any one but a native. It is made by simply placing the milk in a large iron pot over the fire, which, with the addition of rennet made from the stomach of the deer, quickly coagulates. The curd is then pressed, and the whey, being separated from it, is put into shallow moulds of about the size of a small plate. Bad as it is, the hardy Laplander is very partial to it both raw and roasted; in the latter state it appears at the tables of the merchants, and is rather more eatable than when unprepared. When heated, an oily juice exudes from it, which is found of great use in removing the effects arising from being frost-bitten. Butter is seldom if ever made of rein-deer milk by the Laplanders, but it is so by the Finland settlers, who in many parts of Lapland keep herds of rein-deer, the colour of which, it is said, is peculiarly white. The Laplanders sometimes vary

Lapland.

Habits and modes of life.

Lapland. their dishes by mixing different kinds of wild berries with the whey, the latter being previously boiled till it acquires some degree of consistency. They are no less fond of the roots of the angelica, which has an agreeable taste, and likewise possesses antiscorbutic properties. Much value is set upon the blood of the rein-deer, from which a variety of dishes is prepared, care being always taken to preserve it when the animal is killed. It is also supposed to possess antiscorbutic properties. Those who reside upon the coast subsist chiefly on fish, with a little beef and mutton occasionally. The furniture consists of horn spoons, pots and kettles made of brass or copper, and sometimes of stone, wooden bowls capable of holding about twelve quarts, a basket for holding cheese, and a barrel for oil and other liquids. Some of the richer natives possess the more showy utensils, such as pewter plates, and spoons of silver. The highland Laplanders obtain all the artificial light which they require from the fire alone, but those on the coast use a rude sort of lamp. One or two shelves for cheese run along the upper part of the house; and a few rennet bags, containing the milk for winter use, are suspended from the roof. Oval fir boxes, answering for panniers, are employed in transporting their goods; two of them, weighing about two pounds each, are carried by one rein-deer. The most ornamental article of furniture is the cradle, which is a piece of wood hollowed out, and having a recess for receiving the head of the child, and being provided with cords, by which it is fastened to the mother's back when she travels. In shape it somewhat resembles the sledge, with the lower part open, and the upper protected by an arched covering made of leather, which shelters the head of the infant. It is stuffed with soft moss, is portable and safe, and, when slung on the back, the head of the child appears above the shoulders of the mother, whose hands are left at liberty, and who is otherwise little incommoded by her burden in travelling.

Herds. The herds of the Laplanders vary much in size, and this circumstance constitutes their riches or poverty. He who has 1000 rein-deer is accounted rich, though instances are by no means rare of one individual possessing 1500 or 2000 animals of this description. With three hundred a family may live in tolerable comfort, but with one hundred subsistence is precarious, and fifty reduces a Laplander to the state of a menial. He is no longer independent and able to keep a separate establishment, but generally joins his herd to that of a richer proprietor, whom he serves in the capacity of a servant, milking and tending the herd. Sometimes when thus reduced he migrates to the sea-coast, where he supports himself by fishing or otherwise. If successful in his efforts, he returns, purchases a herd, and resumes his pastoral habits. It more generally happens, however, that having once become a coast Laplander, he remains so to the last, being naturally too thoughtless and improvident to carry his views beyond the exigencies of the moment. Should the herd of the mountain Laplander be at all numerous, it rarely happens that the possessor is aware of the exact number, there being a superstition prevalent amongst them, that counting the flock, like numbering the heads of the Israelites, will be attended with evil. During the day they are allowed to wander over the hills where they please, but watched by a shepherd, who observes their motions, and is assisted in his duties by several dogs. These are in readiness not only to guard against any attack of wolves, but also to prevent the herd from being too widely dispersed, and to assist in bringing them to the fold in the evening to be milked. After they are brought into this enclosure, and secured by a cord attached to the horns, and held either in the hands, or fastened to some shrub, the women bring their bowls from the tent, and proceed in the operation in the usual way. Many of the deer are very refractory whilst this is going on, and, butting with

their horns, not unfrequently overthrow the female in attendance. The Laplander justly sets a very high value upon his dogs, the services of which are invaluable. The breed is remarkable for the smallness of its size, resembling the arctic fox in every thing but colour.

The employment of the highland Laplander may be said to be entirely confined to the care of his deer; and when not actively engaged in tending them, he most frequently stretches himself in his tent in a state of listless ease, or amuses himself by fashioning a rein-deer's horn into a spoon. But this monotony is occasionally broken by a hunting excursion, in which he pursues the bear and other animals. Ptarmigans, foxes, gluttons, martens, and other animals, he either shoots, or catches by means of traps and snares. He has several kinds of sledges, both for the conveyance of himself and of his effects. The pulk, which is intended for the use of merchants and other travellers, in form resembles a boat, and is about seven feet in length by sixteen inches in breadth, and generally about eight inches in depth, the back board or stern part being about sixteen. The head of the pulk comes to a point like a canoe; the stern is flat, and the bottom or keel convex. Above it has an oval half deck in front, covered with seal-skins. This is the close pulk; the open sledge wants the deck, but its general dimensions are similar to the other, and it is made, like it, of birch wood, although of ruder construction, and finished with less care. For the conveyance of goods, there is another open sledge of much larger dimensions, being about eight or nine feet in length, and of proportionate breadth. One deer is sufficient for a sledge, to which it is attached by a very simple harness, consisting of a collar of rein-deer fur for the neck, a trace which passes between the legs of the deer, and through a broad belly-band of cloth fastened round the body of the deer. There is of course a bridle and rein, and round the neck is a loose band of cloth, to which a bell is suspended, the sound serving to keep the party together. Although the difficulty of preserving the equilibrium of the pulk is at first very great, yet, so expert is the Laplander in guiding it, that the chief accidents that happen to him in his winter expeditions arise either from losing his way, or being caught by snow-storms or snow-drifts. Without these convenient vehicles it would be impossible to traverse a country so rugged and broken as Lapland, and even with this advantage as to locomotion, the difficulty is very great. The speed with which the animal travels is remarkable, ten miles an hour being easily accomplished at a trot, and probably double that space at a gallop. In the interior parts of Lapland travelling is suspended during summer, roads being unknown here; and it is only in winter that, by the aid of this invaluable animal, the country can be traversed. In some parts of Lapland, rein-deer have been made available for agricultural purposes, such as ploughing and harrowing; but this only happens when the proprietor is very poor. They are likewise employed during the winter season in drawing hay and fodder loaded upon trays. The Laplanders, especially those of Finmark, have a mode of travelling by means of the *skie* or snow-skait. It is made of wood, is very narrow, but frequently more than seven feet in length. In many parts of Lapland the greatest use made of them is in pursuit of wild rein-deer, and the other animals with which the country abounds. With these he makes rapid progress, and undertakes very long journeys without any other means of locomotion.

Various reasons induce the mountaineer to repair to the coast during the summer season. First, that his herd of deer may escape the gad-fly, with which, in June, July, and August, the rein-deer are much tormented; and secondly, to sell or barter the disposable commodities which he has collected during winter. These consist of the skins and horns of the deer which he has killed for the support of

Lapland his family during winter; and the skins of other animals which he has succeeded in capturing, such as the bear, fox, glutton, and marten, and the feathers of the ptarmigans which he has shot or ensnared. All these are valuable articles of commerce to him; and, by bartering them with the merchants of the coast, he is enabled to procure others that are necessary to his comfort in winter, such as coarse cloth, meal, gunpowder, and tobacco. It is also a matter of belief with the Laplander that it is absolutely necessary to the existence of his rein-deer, that they should once during the summer drink salt water; and this forms another and a very strong inducement for him to visit the coast. The deer eagerly drink salt water, and the draught is said to be efficacious in destroying the larvæ of the gad fly, which lays its eggs in the hide of the animal previously to quitting the forest. The annual migration of the Laplander commences in June, by which time the snow is generally off the ground, and consequently his mode of travelling is no longer in sledges. These, with all his winter necessities, are left behind him in his summer expedition, and he commonly deposits them in the storehouse which almost every highland Laplander possesses, near his church, in the neighbourhood of which he generally remains during the winter. The distance which he has to travel varies according to the situation of the coast to which he is bound, but sometimes exceeds three hundred miles. Sir Arthur de Capel Brooke, speaking of migrations, observes, "the Swedish Laplanders that repair to the coasts of Tromsö and Senjen belong chiefly to Tornea Lapmark, inhabiting the shores of the Tornea Träsk. These parts are also the resort of those from Enontekis, in Russian Lapland. The Laplanders from the other Lapmarks make for other parts of the Norwegian coasts which are nearest to them; and, though the distance may be less, they do not, I believe, ever bend their steps toward the Gulf of Bothnia, preferring the coasts of Norway, from the absence of wood, the freshness of the breezes, and the freedom from the insects which swarm in the forests that skirt the shores of the gulf, as well as in their own."

In studying the health and safety of their herd, they generally make choice of the numerous islands on the western coasts of Norway and Lapland, from their superior coolness, as well as from the absence of bears and wolves. These also present a great advantage in being very convenient stations for fishing, and possessing good harbours; whilst fish likewise resort in great numbers to the numerous fiords or bays, and narrow channels between them. This is the reason why on the whole of the northern line of coast the mainland is nearly uninhabited, with the exception of the borders of the fiords, though the only supply of wood is to be found there; whilst almost all the rocky isles so profusely scattered along the coast possess inhabitants, although generally barren in the extreme. After the mountain Laplander has reached his fishing station, he erects his tent of coarse wadmal cloth, and proceeds to barter his skins, furs, and other articles of commerce, for necessities which he requires, but principally for brandy, which he drinks to excess. Indeed it sometimes happens, that when he is about to return to his winter quarters, he is occasionally obliged, though reluctantly, to part with his deer, in order to supply himself with what is absolutely necessary to his existence. The mountain Laplander makes it a point to be paid in silver in all his dealings with the merchants; and he frequently amasses a considerable quantity of dollars, which he usually buries in the ground in some spot near his tent. In September, he breaks up his summer quarters, and gradually retires into the interior parts of the country. The circumstances which oblige him to return is the want of rein-deer moss on the islands, and also of fuel, both of which are readily procured in the in-

terior parts of the country. The want of the latter is said to have led to the gradual and almost entire depopulation of the Finmark coasts. His stock of necessities and household utensils are packed in a kind of wicker pannier, one of which hangs on each side of the deer, and, by slow and easy stages of six or seven miles a day, he reaches that part of the continent where he intends to fix his winter abode. Venison constitutes the principal article of food of the highland Laplander in winter, the only season when he kills his deer for supporting himself and his family.

The coast Laplanders support themselves entirely by the Fisher fishery, which is astonishingly productive, 2000 lbs. weight &c. of cod-fish being caught in a day by means of lines alone. From the great number of small Russian vessels which frequent the coast at certain seasons, they find a ready sale for the fruits of their industry, receiving in exchange chiefly meal, brandy, tobacco, and the like. Whales are abundant, particularly what is called the fin whale, which is long, active, swimming with great strength and speed, and consequently difficult to capture. It is usually killed by darting the harpoon into the body, and then breaking it close off. No more notice is taken of it at the time, but the wound generally proves mortal, and in a few days the animal is found cast upon some part of the neighbouring shore. The value of a good whale of this kind is about L.150, or 1000 specie dollars. The owner is known by a mark on the barb of his harpoon, by which he identifies his property; but law entitles the finder to one third of the booty. Great quantities of other kinds of fish, particularly the sey or coal-fish, are likewise caught. The latter are taken by means of nets, and this fishery constitutes one of the most lucrative branches of the Finmark trade, as does the down of the eider-duck. Plaice of a huge size, halibut, and echini of all hues and sizes, are likewise amongst the fish taken; but of shell-fish there are few or none, the northern shores, from their nature, being particularly barren of testacea. Halibut of 500 lbs. weight is frequently taken, and it is esteemed a great delicacy. The farming stock of the coast Laplander consists of a few sheep and goats, and sometimes a cow or two; but pigs are little known in Finmark, and do not constitute part of his property, sheep being of superior utility in furnishing him both with food and raiment; and his wants are, besides, very limited. On the approach of winter the whole of the cattle are brought from the mountains, where they are sent to graze during summer, and are shut up in stables. The weight of the cattle is not considerable. During winter, as a substitute for fodder, they are almost entirely fed upon fish, to which they are very partial. Some of the shore Laplanders keep rein-deer, but these animals very rarely constitute part of their property.

In their manual arts and manufactures, that is, making the various utensils which their mode of life requires, the Arts, manufactures, Laps display some ingenuity. Their sledges and canoes are very strongly and closely put together, so as to be entirely impervious to water. They tan hides with the first inner bark of the birch, make strong cordage and thread of the sinews of the rein-deer, weave coverings for their tents, knit gloves, fashion wooden utensils for domestic purposes; and the women prepare the skins of foxes, fawns, otters, and other animals for sale, by stripping off the membranous parts, and curing them with fish-oil. The Laplanders have a few amusements, but the chief is hunting, which, however, rather constitutes a part of their professional avocations, than of their choice pastimes. The bow and arrow, which formerly constituted their offensive weapons, are now supplanted by fire-arms, particularly rifles, in the use of which they are very expert. A taste for music and poetry have been attributed to the Laplanders; but this, Sir Arthur de Capel Brooke observes, is a mistake, arising from travellers mistaking Finns for Laplanders, a circumstance which very frequently takes place. Amongst the

Lapland. amusements of the Laplanders may be mentioned their occasionally assembling at feasts, where the favourite beverage, brandy, freely circulates, and mirth and noisy loquacity prevail. At marriage-feasts hundreds meet, and the ceremony is conducted with great formality and decorum; but the more solemn ritual of a funeral is characterized by an appropriate want of anything like parade or show.

Russian Lapland begins at the Waranger Fiord, under N. Lat. 70., and extends as far as the White Sea. Admiral Litke, in surveying its northern coast, in the years 1822-3, has noted down many interesting particulars, from which we derive the following notes:—

It may appear surprising, but it is nevertheless true, that this coast, navigated for three centuries by the first maritime nations, was, before Admiral Litke's survey, less known to us than many of the most distant and uninhabited parts of the globe. Vessels trading to Archangel had, for a long time, only the *Zeefahel* of the Dutch for a guide. Litke, June 1822, began his survey of the Lapland coast at Cape Orlov, in about N. Lat. 67. This, the eastern extremity of Russian Lapland, consists of high, steep, and bare rocks. Near Sviatoi Nos (in N. Lat. 68.) the coast has an inviting appearance; the S. side of the islands, or indentations, being covered with beautiful turf, wild leek, and a number of strawberries, but there were no bushes. On the main shore, however, were seen low dwarf birch and juniper bushes, and numerous tracks of rein-deer. During summer, as Admiral Litke was here informed, there is no land route through Lapland; and all who are then necessitated to travel,—as, for example, clergymen, the judges, or officers of judicial courts, &c.,—pass by *shnakes* along the shore, by stations, from Kola, round the whole peninsula, as far as Kandalaksha, in the extreme north-western point of the White Sea. Between Kandalaksha, however, and Kola, they manage to travel in the usual manner.

A little to the W. of Sviatoi Nos is the mouth of the Yukanka River, which is navigable for 3 to 4 sea miles up, when rapids commence, and prevent navigation, even for small boats. On the left bank of this river lies a Lopar village, called the Yukanka Lodge; for all places of the Lopares, both for summer and winter residence, are called by the Russians *pagosti* (lodges). The summer houses are entered about the beginning of May, and are inhabited until the first snow, when the winter quarters are re-entered, which are 150 to 200 wersts farther inland. The rein-deer, which the Lopares bring with them to this coast, are then let loose on the islands, or on the bogs, and in autumn they are found again by their tracks in the snow. Sometimes, however, rein-deer are lost on the bogs, or are devoured by wolves. On the islands, on the contrary, they are secure; but they would not all find food there. The Lopares are occupied during summer with fishery, and those on the Yukanka River chiefly take salmon, the neighbouring sea being poor in other fish. The fish taken is either used by themselves, or bartered for flour and other necessities, brought to them from various parts of the White Sea. Sometimes they lease for a summer the whole river, or part of it, to Archangel traders. One of their most important occupations during summer is the making of their *keroschki*, i. e., winter sledges, which resemble a pointed trough. During the winter, the Lopares are employed with fishery in the lakes, and with the chase. The Yukanka lodge consists of eleven vyeyi, inhabited by about sixty persons of both sexes. These vyeyi are made of wattles, of a conical shape, covered with thorn-bush branches and moss, and are from 7 to 10 feet wide, and 5 to 7 feet high. A small opening on the ground serves at the same time for window and door, whilst the smoke escapes through another hole at the top. In the middle of the vyeya is a hearth made of stones, where a fire is burning for the purpose of heating, cooking, and bread-baking: the latter is done in a most simple way, by

making a dough of flour and water, and forming it into a flat cake, which, with one side, is laid on a hot stone, and with the other, is turned to the fire, and, when done, is called bread. The place between the hearth and the wall is filled with branches, and covered with rein-deer skins, and there the inhabitants sleep, wrapping themselves up in other rein-deer skins. Around these vyeyi prevails a filth and disorder that is frightful: the entrails of fish, heaps of bones, dogs, kettles, sledges, and keroschki, are lying about pell-mell, spreading most offensive smells. The appearance of the Lopares themselves, however, is quite pleasing. The men are dressed in short woollen overcoats, mostly of blue colour, with a similar coat underneath, worsted stockings, and shoes. The women wear Russian *sarafanes*, and around the head the Russian *kakoshnik*, or handkerchiefs.

About 30 miles N.W. from Yukanka is Cherni Nos, or Black Cape; and near it, Noknev Island,—in earlier charts, called Nagel, or Nagol. Here Admiral Litke found that the needle showed no variation. On the main shore, near Noknev Island, the principal fishes caught are salmon, bib, *paltus*, and *piksha*. The *peshchanka* (sand-eel) is caught in a remarkable manner. Some time before ebb, the Lopares set about digging up the wet sand close above the strand line; with almost every step they dig out such a fish, to which, however, they must not allow a second's time, as otherwise it would be sure to dig itself in again, and escape. As soon as they perceive it, therefore, they seize it with a handful of sand and throw it violently on the ground. The fish, thus stunned, are collected in baskets or casks. It is strange that this fish is found only at ebb during the day, and never at night. The people of this place had also some sheep, which had abundant food in the adjoining pastures.

The chief island on the coast of Russian Lapland is Kildin, —not Kilduin, as the Dutch call it,—and lies 11 miles E. from the mouth of the Kola Bay. It is 9 miles long, and $1\frac{1}{2}$ to $3\frac{1}{2}$ miles broad. Its shores are high and precipitous on the N. side, and terminate abruptly in a perpendicular rock on the W., while on the S.E. side it slopes down gently to the sea. The appearance of the S. coast is most peculiar, rising as it does in four most regular terraces, forming an amphitheatre of 500 feet in height, with a flat table-like top. This coast is everywhere clothed with the richest verdure, forming a most striking contrast with the bare granite crags on the main shore. The island consists of primary slate, and thus differs from both the islands and the main shore to the south-eastward, which show only granite.

Rein-deer, belonging to Mr Popow, merchant in Kola, are pastured on this island. He introduced them here about twenty-five years ago, and since then their number has increased from two or three couples to several hundreds. Mr Popow permitted the Lopares to use these rein-deer on condition of delivering to him the skin of every beast killed, and paying him for the meat one *pud* of salmon, or other fish they may take during the winter in the lakes. Excellent mushrooms, called *mochoviki* (bog-mushrooms), grow in great abundance.

Kola, the capital of Russian Lapland, is situate at the confluence of the Rivers Kola and Tuloma, about 30 miles from the sea. As determined by Mr Rasumowski, who, in the last century, observed in this place the transit of Venus over the sun, the latitude of the city is 68. 52., the longitude 33. 1. E. from Greenwich. It appears that Kola was founded long before 1533, as English and other mariners traded already about the middle of the sixteenth century to Kola as to a well-known place. It was at first only a *wolash* (capital of a district), became under Peter the Great an *ostrog* (fortified place), and since the foundation of the stadtsholdership, the capital of a government. The place extends 530 fathoms along the River Kola, and 175 fathoms along the River Tuloma. Except a church built of stone,

Lapland. all the houses are of wood. The streets are paved with planks. On the bank of the Kola, near the centre of the town, lies a wooden fort, being a square with five towers: since the rupture with England, in the year 1800, the cannon of this fort were removed to the priory of Solowez, in order to put the latter in a state of defence; and since then, the walls of the fort serve only as a fence for the cathedral, and the towers are transformed into storehouses. The number of inhabitants of both sexes were estimated by Litke, in 1822, at about 800, but recent official data show that it was, in 1849, only 642.

As famous names like London, Paris, &c., call forth involuntarily the idea of incomparable splendour, uninterrupted pleasure, and constant happiness, so one thinks, at the name of Kola, of a direful place, the seat of extreme poverty, entirely separated from the civilized world, enveloped in enduring night. Human imagination seldom knows the middle course, and, accordingly, the latter notions are as incorrect as the former ones. The officials and merchants of Kola live in a style varying little from that of the capital. In external appearance, Kola is that of a clean town; and the houses, consisting frequently of two floors, are neat. The view of the town from the N.E. is most charming; it stands on a high and abrupt bank, from which a wide plain extends, bordered on three sides by high hills.

The principal trade of Kola is in fish, particularly in bib (*treshka*) and *paltus*. The Kolaers are not themselves engaged in fishing, but obtain the fish by barter, mostly from the Russian fishers trading on the Lapland coast, partly from the Norway ports of Wadsö, Wardhuus, Hammerfest, and even from Tromsö, to which ports the Kolaers are permitted to export about 2000 *tehetwert* of rye flour every year.

Kola *lodji* go to Archangel to barter their cargo of fish for the various merchandise they require, and some of them venture to set out from the latter place on their return home as late as October. Whilst the men of Kola are thus occupied, their wives and daughters do not remain idle. They cross in little boats to the islands to gather *moroshka*, the berries of *Rubus chamæmorus*. A boat contains usually but one young and able man, and from twelve to twenty women. Among the islands near the Bay of Kola, the Koreline Islands are considered to give the best produce of *moroshka*; they lie 5 miles W. from the mouth of the bay. The Kola women, however, will go still farther, to Motov Bay, and even to the Ainova Isles, at least 100 miles from Kola, in a boat. The *moroshka* from these isles are said to surpass in size and flavour all others, and are mostly destined for the imperial court.

The Bay of Kola, near the town, is so shallow, that even the smallest vessels can approach it only at high water. The River Kola ceases altogether to be navigable at the town; but the Tuloma is navigable for about 40 miles, namely, to its origin from the lake. Its banks are densely wooded with splendid fir.

There is a small and bare island in the middle of the Bay of Kola, called Solnoi Ostrow (Tallow Island), from the immense number of seals which formerly used to come ashore here, but which have entirely disappeared about the end of the last century.

W. from Kola is the Bay of Motov, and Ribachi, or Fisher's Peninsula, in old maps mostly presented as an island. This difference must not, however, be altogether attributed to the inaccuracy of the old charts; for it is not merely possible, but even highly probable, that this peninsula was once separated from the mainland; and this hypothesis is the more probable, because the rising of the Scandinavian peninsula has been noticed before. Almost throughout the whole extent of the coast of Lapland, traces were found by Litke, in a height from 4 to 9 fathoms, that the sea once attained that height. On the isthmus grow very straight

and thick birches; and in case of necessity, fuel can be procured from this wood, although with some difficulty. *Moroshka* grow in great plenty, and of exceeding beauty, on the shores of the peninsula.

The Bay of Motov is very remarkable on account of the whales which are driven in thither every year, in greater or smaller numbers. Sometimes, in the course of the summer, as many as ten whales are cast up; generally fewer, but they are seldom totally wanting. All the shores are covered with bones of these animals, or remains not yet thoroughly decomposed, which emit an insupportable stench to a great distance, and by which bears and other beasts of prey are attracted to the strand. The Lopares, to whom this district belongs, consider as their property everything that is cast up by the sea, and this forms one of their contested privileges. They sell the cast-up whales to the Pomarov, who come to them, for fish and fat. The usual price of a whale is 60 rubles, which is exceedingly moderate, when we consider the quantity of train oil to be obtained from a whale. These whales are probably the *Balæna physalus* and *B. mysticetus*.

On the western side of the Fisher's Peninsula is the Waranger Fiord, which has in its eastern portion the River Petchenga, celebrated, because on its banks dwelt St Triphon, the miracle-performer, who converted the Lopares to Christianity. The abode of this saint still exists at the embouchure of the River Triphonov into the Petchenga, 8½ miles from the mouth of the latter. In the sixteenth century stood there the convent of the Life-bringing Trinity, to which, in the year 1556, the whole coast of Lapland W. of the Gulf of Kola, with all the inhabitants, were given for an ecclesiastical district by Czar Joan Wasilevitch. In the deed of grant, the Bays of Motov, Liza, Ura, Patrez, and Nyawden, are mentioned, and also whatever the sea casts up, such as the whale, walrus, or similar animals. In the year 1589 this convent was destroyed by the Swedes, and afterwards transferred to Kola, but subsequently entirely abolished and combined with the convent of Archangel. On the Petchenga, the church alone remained, adorned, as we are told, with rich pictures of the saints. It has no minister of its own, but one comes there annually from Kola. Petchenga is the Mecca of the neighbourhood; for every Lopar of respectability considers it a duty to worship, at least once in his life, the relics of the God-pleasing saint. In times of danger, they make vows to go to Petchenga to pray.

In the Waranger Fiord, Russian Lapland ceases; and according to Admiral Litke, Cape Weres forms the boundary. It lies in N. Lat. 69. 58., and E. Long. 29. 50. from Greenwich.

One of the latest travellers who have added to our store of knowledge of Lapland generally, is Professor J. D. Forbes, already quoted. He visited a Lap encampment near Tromsö, and gives the following interesting description:—"We at length extricated ourselves from the wood, and crossing the stream, saw the Lap camp before us on a dry and pleasant grassy space, about 2½ English miles from the sea. Some piles of sticks and mounds, which seemed like no human habitation, first attracted attention. The piles of sticks form a sort of skeleton shed, which can be covered in bad weather by a kind of rude tarpaulin. They contain barrels, clothes, and many nondescript utensils and stores, which in fine weather are exposed suspended from the bare poles. Two low round mounds of turf, overlaid with sticks and branches in a most disorderly fashion, composed the habitations of a multitude of men, women, and especially children, who seemed at first sight to be countless. Their appearance—uncouth, squalid, and diminutive in the extreme—was, I thought, decidedly unprepossessing. But an attentive survey brought out some more favourable features. The countenance was altogether unlike any I had seen, but by no means devoid of intelligence, and even a certain sweetness of expression. Notwithstanding that our party was

Lapland.

tolerably numerous, they exhibited no signs either of distrust or shyness; and whilst some of them entered into conversation with one of the gentlemen from Tromsø, who knew a little of their dialect, and others went attended by several small active dogs to fetch some rein-deer for our inspection, from the heights, the greater part remained quietly engaged in their huts, as we had found them, quite regardless of our presence. On inquiring into their occupation, we were surprised to find them possessed of some excellently printed and well-cared-for books, particularly a bible in the Finnish tongue, and a commentary, each forming a quarto volume. We found some of them also engaged in writing. This was a matter of surprise, where we had been led to expect something approaching barbarism; and we had soon a proof that their pretension to religious impressions was not merely theoretical, for they positively refused to taste the spirits which were freely offered to them, and of which our party partook; though it is well known that excessive and besotting drunkenness used to be the great sin of the Lappish tribes, and still is of those who have not been converted to habits of order and religion by the zealous efforts of the Swedish missionaries who have indefatigably laboured amongst them.

"The Lap hut is formed interiorly of wood, by means of curved ribs, which unite near the centre in a ring, which is open, and allows free escape for the smoke, the fire being lighted in the centre of the floor. The exterior is covered with turf. The door is of wood on one side. The inmates recline on skins on the floor, with their feet towards the fire; and behind them, on a row of stones near the wall of the hut, are their various utensils. Their clothing—chiefly of tanned skins and woollen stuffs—looked very dirty. Their whole wealth consists in rein-deer. The two families who frequent this valley possess about 700 deer. We saw, perhaps, about one-fourth of that number. A few of them were driven, for our inspection, into a circular enclosure of wooden paling, where they are habitually milked. One of the men dexterously caught them by the horns with a *lasso*, or noose. The deer are small; but some of them carry immense branching horns, the weight of which they seem almost unable to support. At this season their long winter coat of hair came off by handfuls. They make a low grunting noise, almost like a pig. The milk is very small in quantity and excessively rich."

Population.

The whole population of Finmark does not exceed 45,000. The degrading superstition in which they were formerly sunk, has now in a great measure disappeared, along with those numerous deities which they worshipped: the wild creations of unenlightened nature have been superseded by Christianity, and a knowledge of the true God. Regular clergymen are established in the country by the different governments, and the Laps exhibit much reverence and devotional feeling during divine service, although its purport is only known to them through an interpreter. Finmark, in regard to ecclesiastical regulations, is under the jurisdiction of the Bishop of Norland and Finmark, both of which form one diocese. Swedish Lapland has a population of only about 12,000.

Language.

The language of the Laplanders is a Finnish dialect, with so great an infusion of foreign words, that the inhabitants of the two nations require an interpreter before they can understand each other's meaning. "The numerous cases," says Malte-Brun, "the varied terminations of nouns and compound verbs, the method of expressing pronouns by *affixes* joined to verbs, and, lastly, the negative conjugations, are characteristics equally applicable to the languages of Finland, Esthonia, and Lapland. The last is in some respects still poorer than the other two; thus there are five words for snow, seven or eight for a mountain; but honesty, virtue, and conscience must be expressed by a periphrasis. The Lapponic has been mixed, perhaps

still more than the other Finnic tongues, with the German and Scandinavian, which were spoken by the conquerors, who were too often the tyrants of the Finnic race." Some old Hungarian roots are also found in it, from which circumstance, as well as from others, it has been inferred that the Laplanders are the descendants of a Hunnic mixed with a Finnic people, or perhaps a distinct branch of the great Finno-Hunnic race. The principal roots and derivatives in the Lapponic tongue certainly bear less affinity with those of the languages of Upper Asia than any other Finnic dialect. See also *Leemii de Lapon. et Finmar. Commentatio.*

(J. F. S.) (A. P.)

LAR, a town of Persia, the capital of the province of Laristan, and formerly of an Arabian kingdom, is situate in a spacious plain at the foot of a range of hills, in N. Lat. 27. 30., E. Long. 52. 45., 180 miles S.E. from Shiraz. The inhabitants are chiefly employed in the manufacture of gunpowder, arms, and cotton fabrics. Among its buildings are a dilapidated fort, a handsome bazaar, said to be the best of the kind in Persia, and the fortified mansion of the klan, or governor. Pop. about 12,000.

LARCHER, PIERRE-HENRI, a learned Greek scholar, was born at Dijon in 1726. At an early age he gave himself up to the study of Greek and English, and made himself known by translations from both of these tongues. He greatly extended his fame by his controversy with Voltaire on the subject of that writer's *Philosophie de l'Histoire*. This work was thought highly dangerous by the orthodox, and Larcher was urged to reply to it, which he did in his *Supplément à la Philosophie d'Histoire*. He was thought to have the best of the argument; but his antagonist, in a rejoinder, entitled *Défense de mon Oncle*, overwhelmed him with ridicule and persiflage. Larcher incautiously adopted the same style in his *Réponse*, but in that vein he was no match for his opponent, and to all the future sneers of Voltaire he did not dare to reply. In 1775 he published his *Mémoire sur Venus*, which was crowned by the Academy of Belles-Lettres. Three years later he became a member of that society, and contributed to its Transactions some valuable papers, chiefly on the vases and festivals of some of the nations of ancient Greece. When the Imperial University was instituted, Larcher was made titular professor of Greek; but he was then eighty-three years of age, and could only do duty by deputy. He died in 1812 of the effects of a fall.

Of Larcher's translations may be mentioned the *Electra* of Euripides; Xenophon's *Apologia* and *Anabasis*; Pope's *Martinus Scriblerus*. His name, however, is kept alive chiefly by his *Herodotus*, which appeared in 1786. From the first it was condemned as clumsy and inelegant, though correct in the main; but the value of the geographical and chronological notes was acknowledged as great. Even these have been now, to a great extent, superseded by the later researches of Rennell, Niebuhr, Dahlmann, Jäger, and Bähr.

LARDNER, NATHANIEL, D.D., author of the *Credibility of the Gospel History*, was born in 1684 at Hawkhurst, in Kent. On leaving the school of his native town, he went to study in London, in the academy of Dr Oldfield, a Presbyterian dissenter; and at the age of sixteen, according to a custom then common among the English dissenters, he went over to Holland, and studied there for three years under Burmann, Grævius, and D'Uries. He returned to England in 1703, spent six years more in the special study of theology, and took license in 1709. He was not popular as a preacher. His elocution was bad, chiefly from deafness, being such that he could not modulate his voice properly. In 1713 he entered the family of Lady Treby as private chaplain and tutor to her son, and remained with her till she died in 1721. From this time till his death he devoted himself almost wholly to the writing of those works, which have given him a foremost place among the

Lar
||
Lardner.

Lares
||
Laristan.

theological scholars of Britain. His public duties were limited to occasional lectures in the Presbyterian chapel at Old Jewry. Though the value of his writings was freely acknowledged, he was very meanly remunerated for them. A small property which he possessed in his native town secured him against the worst evils of poverty. At the time of his death, which happened at Hawkhurst, in 1768, he had completed his eighty-fourth year.

The most important of Lardner's works is his *Credibility of the Gospel History*, in which proofs of the truth of Christianity are brought together from innumerable sources in religious history and literature of the first five centuries. It was published between 1730 and 1757, and still holds its place as one of the strongest bulwarks of revealed religion. The *Supplement* to this work, and the *Large Collection of Jewish and Heathen Testimonies*, are in an equal degree distinguished by profound learning and close and cogent reasoning. The composition of these works occupied the better part of forty-three years. Of the less elaborate essays thrown off during this time, the most important was his *Letter concerning the question, Whether the Logos supplied the place of the Human Soul in the Person of Jesus Christ*, in which he openly professed himself a Socinian. There are two complete editions of Lardner's works, one in 11 vols. 8vo, edited, in 1788, by Dr Kippis; and another in 5 vols. 4to, Lond. 1815.

LARES, the household gods of the Romans, whose images stood on the hearth in a little shrine (*ædes*) or a small chapel (*lararium*). The name is of Etruscan origin, and signifies kings or heroes. The Lares seem to have been identical with the Manes, but it was only the spirits of good men that were worshipped as such. Of the domestic Lares, the *Lar familiaris*, as founder of the family, was the chief, and was always taken with the family in its changes of abode. In every household there were generally two Lares at least, and they were either clad in the skin of a dog, or represented with a dog at their feet. In their hands they held a cornucopia; and on their festivals, which fell on the first of May, they were crowned with garlands, and worshipped with sacrifices. Besides the *Lares domestici et familiares*, there were also *Lares compitales et viales, militares et marini, urbani, rurales, &c.*

LARGS, a port and watering-place of Scotland, county of Ayr, on the Firth of Clyde, 22 miles W.S.W. from Glasgow. Weaving and fishing form the chief occupation of the industrial classes. Adjacent to the town is the battlefield of Largs, where Alexander III. defeated Haco, King of Norway, in 1263. Tumuli and cairns still mark the ground. Pop. (1851) 2824.

LARISSA (Turkish *Yenitche*), a town of European Turkey, the ancient and modern capital of Thessaly, on the right bank of the Selembria, here crossed by a bridge of ten arches; 37 miles E. by N. from Trikala; N. Lat. 39. 52., E. Long. 22. 40. 23. It is composed of unsightly miserable houses, built of clay and wood, and forming streets narrow, crooked, and filthy. Manufactures of silk, morocco-leather, and cotton. A Greek metropolitan church, several mosques, and some bazaars occupying an open area in the centre of the town, are worthy of notice. Pop. about 25,000, three-fourths of whom are Turks.

LARISTAN, a maritime province in the S. of Persia, extending from N. Lat. 26. 30. to 28. 25., and from E. Long. 52. 30. to 55. 50., is bounded S. by the Persian Gulf, W. and N. by Fars, and E. by Kirman. Its greatest length from E. to W. is 210 miles; its greatest breadth from N. to S., 120 miles. Area 16,000 square miles. It consists of two parts: the northern and upland part, skirted by a long chain of mountains running from S.W. to N.E.; the southern and lowland part, consisting of steppes of sand and salt, interrupted at intervals by rocky mountains. The only important river is the Nabou, in its western corner. On the

Larne
||
Lascaris.

coast, the inlets of the sea are numerous. Among the northern mountains there are some fertile tracts, yielding dates and other fruits. Of the products of the rest of the province, the chief are camels, salt, and silk. The coast is inhabited by independent Arab tribes. The capital of the province is Lar.

LARNE, a sea-port and market-town of Ireland, county of Antrim, on the N. shore of Lough Larne, 18 miles N.N.E. from Belfast, of which it is an out-port. The manufactures are cotton, sails, ropes, and leather; and the trade carried on is almost exclusively in slate, lime, timber, and coals. The chief object of interest is the ruined castle of Oldfleet, erected in the reign of Henry III. It is the seat of a poor-law union, and of a petty sessions court. Edward Bruce landed there in 1315. Pop. (1851) 3074.

LARNICA, or LARNECA, a town on the S. coast of the island of Cyprus, on a marshy plain, about a mile from the shore, and 23 miles S.E. from Lefkosia. The houses are built of mud, and only one storey in height, through fear of earthquakes. It has a citadel, a cathedral, two convents, a mosque, and several cisterns. Larnica is the chief place of trade in the island, and the residence of the European consuls. The principal exports are wine, silk, wheat, cotton, and drugs. Rice and sugar are imported from Egypt; cloth and hardware from Malta and other places. Larnica is near the site of the ancient Citium, the birthplace of Zeno the Stoic, and contains many vestiges of antiquity. Pop. about 4000.

LASCARIS, CONSTANTINE, an eminent Greek scholar of the fifteenth century, was a member of the royal house of Lascaris, and was born at Constantinople, but in what year is not known. When the Turks became masters of that city in 1453, he sought an asylum in Italy, where Francesco Sforza, Duke of Milan entrusted him with the education of his daughter Hippolyta, afterwards married to Alfonso, King of Naples. On leaving Milan, he went first to Rome and afterwards to Naples, in both of which cities he taught Greek and rhetoric. A few years later, when on a visit to Messina, he was so cordially received by the inhabitants that he determined to settle there. The school which he established enjoyed a great reputation till his death in 1493. Among his pupils was the celebrated Bembo. Lascaris bequeathed his library and valuable MSS. to the senate of Messina. They were afterwards carried off to Spain, and are now preserved in the Royal Library of the Escorial. His published works are—*Grammatica Græca, sive Compendium octo Orationis partium*, Milan, 1476, in 4to, being the first book printed in Greek; *Two Opuscula* on the Sicilians and Calabrese, who had written in Greek, published, for the first time, by Maurolico in 1562. A Dissertation on Orpheus, printed in the first volume of the *Marmora Taurinensia*, from a manuscript in the library of the King of Sardinia. These works, though now of little value, were useful in their day, by reviving the study of the Greek tongue in countries where it had long been dead.

LASCARIS, *Andreas Joannes*, a learned Greek, of the same family with the preceding, and surnamed *Rhyndacenus*, because he was born on the banks of the Rhyndacus, in Bithynia. On the Turkish conquest of Constantinople, he took refuge at the court of Lorenzo de' Medicis, who sent him to Greece to collect valuable MSS. in that country. Lascaris returned with a large number, and a few years afterwards, made a second voyage to Greece for the same purpose. Before his return, Lorenzo died, and Lascaris, on the invitation of Charles VIII., removed in 1495 to Paris, and began to teach Greek publicly. Among his pupils were Budæus and Danes. In 1503, and again in 1505, Louis XII. appointed him to the embassy of Venice; and at a later period Leo X. invited him to Rome, to take charge of the Greek college newly founded there. In 1515 the pope sent him on a mission to Francis I.; and this prince,

Las Palmas sensible of his merits, endeavoured to retain him in France. Lascaris, however, returned to Rome the same year; but he revisited Paris in 1518, and, along with Budæus, was employed to form the Royal Library of Fontainebleau. Francis I. then appointed Lascaris his ambassador to Venice, as his predecessor had done; and he remained in that city until Pope Paul III. urgently pressed him to settle at Rome. Though suffering seriously from bad health and the infirmities of old age, he immediately set out; but he only survived his arrival at Rome for a few months, dying in 1535, at the age of nearly ninety.

The principal works edited by Lascaris are—*Anthologia Epigrammatum Græcorum, libri vii.*, Græce, Florence, 1494, in 4to; *Callimachi Hymni Gr. cum scholiis Græcis*, ibid. in 4to, the *editio princeps*; *Scholia Græca in Iliadem, in integrum restituta*, Rome, 1517, in folio, a very rare edition; *Homericarum Quæstionum liber, et de Nympharum antro in Odyssea opusculum*, ibid. 1518, in small 4to, the *editio princeps*; *Commentarii [Græci] in septem Tragædias Sophoclis*, ibid. 1518, in small 4to. He also translated into Latin some treatises of Polybius on the military art. The following smaller works are also ascribed to him—*Epigrammata Græca et Latina*, Paris, 1527, in 8vo, and 1544, in 4to; *De veris Græcarum Litterarum formis ac causis apud Antiquos*, Paris, 1536, in 8vo; *Orationes, Francfort, 1575*. The *Nuova Scelta di Lettere*, by Bernardo Pino, contains one of Lascaris. (J. B.—E.)

LAS PALMAS. See CANARY ISLANDS.

LASSA, or **H' LASSA** (*Land of the Divine Intelligence*), the capital of Tibet, is situate in a fertile plain on the banks of the Dsang-tsu, 30 miles above its junction with the Dsang-bo, in N. Lat. 29. 30., E. Long. 91. 40. The city is composed of wide and regular streets, lined with houses built of mud, brick, or stone, and having their walls whitened, and their doors and window-frames painted with the sacred colours, red and yellow. Lassa is the chief seat of commerce in Tibet, and the resort of merchants from all parts of Asia. The principal articles of its trade are linens, woollen cloth, Cashmerian shawls, sable furs, raw silk, musk, sugar, dried fruits, sweetmeats, bullion, glass, and cutlery. Foreign merchants and workmen reside in parts of the city allotted to them, according to their nations. The women of Lassa cover their faces with a thick dark varnish before appearing in public. The town is walled, and contains some fine public edifices, the chief of which is the lamasery of Moru. In the suburbs are situate the four largest lamaseries in Tibet—Prasbung, Sera, Samie, and Pobrang-Marbu. The last of these, built on Mount Botala, to the N.W. of Lassa, is the residence of the Dalai-Lama, is 367 feet in height, and said to contain 10,000 rooms. These lamaseries are attended by thousands of students from different parts of Asia. Pop. of city and suburbs, about 50,000.

LASUS, or **LASSUS**, a Greek poet and musician, respecting whom only a few facts have been transmitted to us. He was the son of Charbinus, a native of Hermione, in Argolis, and flourished about the sixty-ninth olympiad (B.C. 504), during the reign of Darius I., King of Persia. Some of the ancients put Lasus in the number of the seven wise men of Greece, to the exclusion of Periander of Corinth. He was the first who wrote on the theory of music, and joined example to precept, being also an excellent musician. According to Clemens of Alexandria, he was the inventor of dithyrambic verse; he was at least the first to introduce it at the public games, and instituted prizes for the successful candidates. (Suidas, *Aristoph. Schol. Vesp.* 1401.) We are informed by Herodotus (vii. 6), that Lasus caused the poet Onomacritus to be banished from Athens by Hipparchus, because he interpolated the poetry of Musæus with false prophecies. He was the contemporary of Simonides, and the instructor of Pindar.

(*Thom. Mag. Vit. Pind.*) Athenæus (viii. 20) has preserved some witticisms of Lasus, which do not tend to raise him in our estimation. He quotes also a hymn to Ceres of Hermione, and an ode entitled the *Centaurs*, in neither of which he had made use of the letter S (x. 455; xiv. 624). (See *Les Remarques de Burette sur le Dialogue du Plutarque touchant la Musique*, in the *Mém. de l'Acad. des Inscrip.*, xv., p. 324.) (C. T. R.)

LASWAREE, a small village of Hindustan, in the rajpoot territory of Macherry, or Alwur, the scene of a desperate battle fought between the British army and Scindia on the 1st November 1803, in which the former obtained a complete victory. In this engagement the Mahratta force, consisting of 9000 infantry and 3000 cavalry, under the command of General Dudermaigne, a French adventurer, was attacked by Lord Lake with his cavalry, which he had, by a forced march, brought on in advance of his infantry. The British cavalry suffered dreadfully, especially from the well-served artillery of the Mahrattas, but after the arrival of the infantry the fate of the day was no longer doubtful. The British arms steadily advanced, and by four o'clock in the afternoon the destruction of the hostile army was complete. A medal, commemorative of the victory, was struck in London in 1851, and presented, with the sanction of her Majesty, to the surviving officers and soldiers who were present at the engagement. The village of Laswaree is 128 miles S. of Delhi. Lat. 27. 33., Long. 76. 59.

LATAKIA, or **LADIKIYEH** (*Laodicea ad Mare*), a seaport-town of the Levant, in the pashalik of Tripoli, is situate on a short tongue of land opposite the north-eastern promontory of Cyprus, 78 miles N. of Tripoli, in N. Lat. 35. 30., and E. Long. 35. 48. It was founded in the beginning of the second century B.C. by Seleucus Nicator, and named, in honour of his mother, Laodice. The surrounding country was at that time very fertile, and produced celebrated wine, which was exported to Alexandria in large quantities. Many ancient remains are to be seen in the town and neighbourhood. The most striking of these is a triumphal arch, or town gate, situate at the S.E. corner of Latakia, and supposed to have been erected in honour of Cæsar Septimius Severus. It is from 30 to 40 feet high, has four door-ways, and is almost entire. Besides this edifice there are the remains of numerous tombs and mausolea, with defaced inscriptions in Latin and Greek. The modern town is divided into two portions, the landward and seaward. The latter, called *La Scala*, or *Marina*, forms the port of the town proper. It is composed of a single range of buildings running parallel with the shore, and is connected with Upper Latakia by a roadway, lined in some parts with houses and villas. Its harbour, formed by a natural basin, and once protected on the N. by a fortress, now in ruins, is sheltered on all directions but the W. It has, however, no depth of water for large vessels. The custom-house, merchants' stores, and British, French, and Austrian consulate offices are situate here. Upper Latakia is $1\frac{1}{2}$ mile distant from the port, the ground intervening being laid out in gardens. It is in a dilapidated state, in consequence of the frequent earthquakes which have visited its neighbourhood, and the streets are, like those of most eastern towns, narrow, tortuous, and dirty. The houses are, for the most part, built of cut stone, with two storeys, flat roofs, and an inner court. The principal buildings of the town are a mosque, adorned with the columns and carvings of some ancient edifice, two Greek churches, and a bazaar. The trade of Latakia is considerable. Its exports include tobacco, cotton, bees'-wax, scammony gum-resin, and sponges; in return for sugar, coffee, cotton, and woollen goods, imported from Western Europe. Its tobacco has long been famous, and is the principal article of export. Latakia and Alexandretta are

Laswaree
Latakia.

||
Latham.

the two ports of Aleppo. Latakia is the see of a Greek bishop. Pop. estimated at 7000.

LATERAN. See ROME, and COUNCILS.

LATHAM, JOHN, M.D., one of the most zealous and successful of English ornithologists, was born June 27, 1737, at Eltham, in Kent, where his father was a respectable general medical practitioner. He received his elementary education in the Merchant Tailors' School in London, whence he was removed, at the age of fifteen, to commence his medical studies under Dr William Hunter, and the other teachers in the London schools, and in the hospitals of the capital. At the age of twenty-six he was established at Dartford, to follow his father's profession; but he had early devoted his leisure hours to the study of natural history, and especially to ornithology; for, in 1771, he was a valued correspondent of Pennant, and assisted Sir Ashton Lever in the arrangement of his noble museum.

In 1781 appeared the first volume of Latham's most valuable *Synopsis of Birds*, which continued to be published in successive parts to 1785. In his title-pages, this work is stated to be in three volumes; but the second and third volumes are each divided into two parts, so that the *Synopsis* makes really six quarto volumes, to which two supplemental volumes appeared in 1787. In this work he adopts the two great divisions of his countryman Ray, into *land* and *water* birds, as more natural than the six orders of Linnæus, who has introduced the water birds between the pies and the waders, and before the *gallinæ* and the *passeres*. Latham, however, has retained the Linnæan genera, with a few exceptions; for which deviations he assigns sufficient reasons. The descriptions of individual birds in this work have never been exceeded in clearness and fidelity; and although the modern ornithologist may consider the Linnæan arrangement and generic distinctions now rather antiquated, the work of Latham has no rival in the English language for accuracy of detail, or the ease with which the young ornithologist can name, and refer to its place in the system, any bird he examines. The figures given in this work are all etched by the author's own hand, from specimens in his possession, prepared and stuffed by himself, and are excellent representations of the birds. Gmelin's edition of the *Systema Naturæ* appeared in 1788; and any one who consults it will find how largely the labours of Latham have contributed to the Linnæan ornithology.

In 1791 Latham published his capital *Index Ornithologicus*, an admirable book of reference, in which many new species are introduced, and prove how sedulously the author cultivated this branch of natural history.

He had become a member of the Royal Society in 1775, corresponding member of the London Medical Society in 1778, and was one of the founders of the Linnæan Society. His fame as an ornithologist was firmly established, and honours flowed in on him; he received the honorary degree of M.D. from the University of Erlangen, and was elected a corresponding member of the Natural History Society of Berlin, and of the Royal Society of Stockholm.

In 1796 Dr Latham retired from medical practice, and took up his abode at Romsey, in Hampshire. There he lived for some years, still cultivating his favourite study, when a severe reverse of fortune overtook him, and he retired to the house of his son-in-law, Mr N. Wickham, at Winchester, in 1819. There he began to prepare for publication his great work, entitled *General History of Birds*; and even in his old age, retouched the plates that had suffered from the many impressions thrown off. The first volume of this work appeared in 1821, and was followed by the sequel, until it reached ten quarto volumes, all equally clear and accurate with his former works. It is perhaps, however, to be regretted that he still followed the Linnæan system, instead of adopting one more adapted to modern discoveries, as that of Temminck, or of Cuvier.

Laticlave
||
Latimer.

Besides these valuable works on natural history, Dr Latham published only a few medical tracts and some contributions to societies of which he was a member.

After a short illness, he died on 4th February 1837, in the ninety-seventh year of his age, and was buried in the abbey church of Romsey.

(T. S. T.)

LATICLAVE. See ANGUSTICLAVIA.

LATIMER, HUGH, bishop of Worcester, the only son of a yeoman, was born about 1472, at Thurcaston, in Leicestershire, and studied at Christ's College, Cambridge, where he took a degree. At the age of thirty, although formerly a zealous Papist, he became a zealous a Protestant, chiefly through the influence of Bilney. Being one of the twelve licensed preachers of the university, he boldly avowed his new opinions, and was summoned, along with his friend Bilney, on a charge of heresy, before Cardinal Wolsey. On subscribing certain articles, they were liberated. Latimer, however, retaining the same fearless spirit, wrote a letter to Henry VIII., protesting against the sin and evil of prohibiting the Bible in English. The King was so far from being offended at this, that, on the recommendation of Cromwell, he appointed him to the living of West Kinton, in Wiltshire. Here he preached so violently against Popery, that in 1531 he was cited to appear before the Archbishop of Canterbury, and the Bishop of London. Cromwell's patronage, however, not only shielded him from danger, but recommended him as chaplain to Anne Boleyn, and advanced him, in 1535, to the bishopric of Worcester. When the famous Six Articles were passed in 1539, Latimer, vacating his bishopric, retired into the country, but coming to London soon afterwards for the cure of a severe injury, he was accused, at the instance of Gardiner, and thrown into the Tower, where he lay for six years. On the accession of Edward VI. in 1547, he was liberated, but refusing, on account of his age, to resume the duties of his bishopric, he remained at court, and became famous for his impartial reproof of the vices of the age. Mary's reign began in 1553, and Latimer was cited before the Privy Council. As he was in the country at this time, and was allowed to obey the citation of his own accord, he might have foiled his enemies by flight. Nevertheless, he set out for London, remarking as he passed through Smithfield, that it had long groaned for him. The Privy Council, after examination, committed him to harsh confinement in the Tower; and in April 1554 he was sent to Oxford, along with Ridley and Cranmer, to hold a disputation with several doctors from the universities. Latimer, alleging his unfitness for a verbal dispute, on account of age, sickness, and disease, delivered his opinions in writing, and was condemned as a heretic. Another attempt to make him recant, was met by his refusal "to deny his master Christ, and his verity;" and accordingly he was doomed, along with Ridley, to be burnt at Oxford on the 16th October 1555. He met his fate with great courage, exhorting his fellow-martyr with these well-known words, "Be of good comfort, Master Ridley, and play the man. We shall this day light such a candle, by God's grace, in England, as, I trust, shall never be put out."

The chief feature in Latimer's character is his piety, alike earnest and cheerful, bold and simple-minded. His heroic zeal for truth and virtue, which sometimes seemed a want of common prudence, was well exemplified when he presented to Henry VIII., for a Christmas present, a Bible marked at the passage, "Whoremongers and adulterers God shall judge." His sermons (the latest edition of which was published at London in 1825) were peculiar in their day for their simplicity of plan and enforcement of practical piety. But the features most striking to us, are a pithy common sense, a colloquial familiarity, and the ingenious and superabundant use of homely imagery; which qualities, although they may now savour of a want of taste, rendered Latimer one of the most impressive preachers of his time.

Latitudi-
narians
||
Latium.

LATITUDINARIANS, the name given to certain English writers who flourished towards the close of the seventeenth century. It was applied more especially to such men as Hales, Chillingworth, Cudworth, Tillotson, Henry More, &c., who gave a philosophical tone to the principles of their theology. They endeavoured to steer a middle course between the extreme Whigs and Tories of the period; between the strict Presbyterians and Independents on the one hand, and the more intolerant Episcopalians on the other; but were branded by both as deists and atheists, as well as Latitudinarians. Their creed most nearly approximated that of the Dutch Armenians; but, as their name implies, they allowed considerable latitude on theological subjects. The Latitudinarian divines were raised to prominent places during the reign of Charles II. Their cause is defended by Fowler, Bishop of Gloucester, in a work entitled, *The Principles and Practices of certain Modern Divines of the Church of England, abusively called Latitudinarians, Truly Represented and Defended, by way of Dialogue*, 8vo, London, 1670.

LATIUM, the country of the Latini, a division of ancient Italy, on the eastern shore of the Tuscan Sea. The etymology of the word is very doubtful. The Romans, accepting the old myth, that Saturn *hid himself* there when dethroned by his son, derived it from *lateo*. Another tradition derived it from the same source, either because the first inhabitants lived or hid themselves in caves, or because the whole country was hidden or sheltered from the rest of Italy by the barrier of the Apennines. A modern etymon, connecting Latium with *latus*, broad, is untenable from the difference in quantity of the roots of the two words. The probability is, that Latium, like most ancient countries, took its name from its inhabitants, and did not give name to them, and that it means nothing else than the land of the Latins. In the classics, the name is used in two widely different senses,—1st, In the early history of Rome it indicates strictly the country of the Latini; 2d, In the later history of Rome it is applied to all the territory stretching from the Tiber to the Campanian frontier, and from the Tuscan Sea inland to Samnium and the Sabini. The original Latium, or *Latium Antiquum*, was bounded on the N. by the Tiber, on the E. by the Apennines, on the W. by the Tuscan Sea. On the S. the boundary was somewhat vaguely fixed; but the whole of the marshy district known as the “Ager Pomptinus,” as far S. as the Prom. Circeum, seems to have belonged to the Latins from a very early period. The southern frontier was a kind of debateable land, occupied at one time by the Latins, and at another by the Volsci; and the border towns, whose origin was perfectly well known, are often mentioned indifferently as Latin or Volscian. A similar state of things reigned on the N. frontier of Latium, where it marched with Sabinum. The whole extent of ancient Latium was very inconsiderable. From Ostia to the Prom. Circeum the coast-line only measured 60 English miles; the greatest length of the country did not exceed 64 miles, while its greatest breadth was about 28. When the league known as the “*Fœdus Cassianum*” was formed between the Romans and the Latins soon after the beginning of the fifth century B.C., the cities which went to form the Latin nation were the following:—Ardea, Aricia, Bubentum, Corniculum, Carventum, Circeii, Corioli, Corbio, Cora, Fortinium, Gabii, Labicum, Lanuvium, Lavinium, Laurentum, Nomentum, Norba, Præneste, Pedum, Querquetulum, Satricum, Scaptia, Setia, Tellene, Tibur, Tusculum, Toleria, Tricrinum, Velitræ. This is the list as preserved by Dionysius. Pliny increases the number from 29 to 53, all of which had perished long before his day, without leaving a trace behind; besides 31 others, which in various degrees of prosperity or decay were still extant. These thirty-one were Algidum, Alba Longa, Antium, Apiola, Ardea, Aricia, Artona, Aurunca, Bovillæ, Circeii, Cora, Corbio, Fabium,

Ficulca, Forum Appii, Gabii, Labicum, Lanuvium, Laurentum, Lavinium, Mugilla, Nomentum, Norba, Ostia, Præneste, Setia, Suessa Pometia, Tibur, Troia, Tusculum, Ulubræ, and Velitræ. Probably there never was a spot on the earth's surface on which so many cities were crowded into so small a space as in ancient Latium. Yet the existence of all these cities is matter of authentic history. Latium Novum comprised, in addition to the whole of the ancient Latium, the country of the Æqui, Volsci, Hernici, and Aurunci, or Ausonians. Its northern frontier remained unchanged; on the E. and S. it was extended as far as the Marsi, Samnium, and Campania. The Liris was vaguely used as the line of demarcation between Latium and Campania. At some points, however, Latium did not reach that river, at others it went beyond it. The Volscian country, when incorporated with Latium, comprised a large tract on both banks of the Liris, with the whole mountain district round Arpinum and Atina on the Samnite frontier. Under Augustus, Latium and Campania formed together the first of the eleven regions into which Italy was distributed for purposes of government. The physical geography of Latium is given under ITALY, CAMPAGNA DI ROMA, and PAPAL STATES.

LATMUS (*Monte di Palatia*), a mountain on the confines of Caria, famous for the fable of Endymion, of whom Luna was said to be enamoured: hence called *Latmius Heros*, and *Latmius Venator*.

LATREILLE, PIERRE-ANDRÉ, an illustrious French naturalist, the “Prince of Entomologists,” as he was called by the Comte Dejean, was born at Brives in 1762. He early gave evidence of a strong capacity, and it was resolved to educate him for the church. A kind friend placed him at the Collège Lemoine at Paris, where he remained for several years. During a subsequent visit to the capital, he found means to make himself known to the leading naturalists of the day, Fabricius, Olivier, Lamarck. In 1791, he became a correspondent of the Society of Natural History of Paris, and of the Linnæan Society of London; and contributed many of the entomological articles to the *Encyclopédie Méthodique*. When the Revolution broke out, he was still in orders, and was involved in the general fate of the priesthood; but the interest of his powerful friends saved him from ruin. The storm began to blow over, and in 1798 Latreille was employed to arrange the collection of insects in the museum. He was next appointed to assist Lamarck, when that distinguished naturalist was disabled by blindness. On his death, in 1829, Latreille was promoted to his chair. He did not long survive his predecessor, dying February 6, 1833, at the age of seventy. In 1814 he had been made a member of the Academy of Sciences, and seven years later a chevalier of the Legion of Honour. It has not been thought necessary here to describe his labours, which are analyzed at great length in the bibliographical part of the art. ENTOMOLOGY, vol. ix., p. 8. To Cuvier's *Regne Animal* Latreille contributed the whole of the *Crustaceans*, *Arachnides*, and *Insects*.

LATRUNCULI, draughts, the pieces of a Roman game which in some respects resembled chess. They were generally coloured black or white, to distinguish the sides on which they were played, and their movements along the *mandræ*, or spaces of the board, were defined by fixed laws. The number of pieces seems to have varied from five to twelve, and in later times the game was converted from one of skill to one of chance, by the use of the *tesseræ*, or dice. The invention of the game is by some attributed to Palamedes, and it was certainly common in the days of Homer. Seneca attributes it to Chilon, one of the seven Greek sages. Like chess, the game runs back to an unknown antiquity.

LAUBAN, or LUBEN, a town of Prussian Silesia, on the left bank of the Queis, 40 miles W.S.W. of Liegnitz. It is walled with four gates, and is the seat of judicial courts for the circle. It has a Roman Catholic and three

Latmus
||
Lauban.

||
Laud.

Protestant churches, a gymnasium, orphan asylum, and two hospitals. Chief manufactures, linen and woollen stuffs. Pop. (1849) 6261.

LAUD, WILLIAM, Archbishop of Canterbury in the reign of Charles I., was born at Reading in 1573. His father was a wealthy clothier, and his mother a sister of the Lord Mayor of London. After receiving his education in his native town till his sixteenth year, he entered St John's College, Oxford, of which he became a scholar in 1590, and a fellow in 1593. He was ordained a priest in 1601; and in the following year read a divinity lecture, which was thought at the time to savour strongly of Popery; and which awakened in the mind of Dr Abbot, then master of University College, that unfavourable opinion of Laud, which time only confirmed. In 1605, being chaplain to the Earl of Devonshire, he sanctioned, by performing the rites of marriage, an illicit connection between that nobleman and Lady Rich, whose husband was still alive. This act, for which he used to read a penitential service every year, proved for a long time an insurmountable barrier to his preferment in the church, and confined his ambition to rapid changes in the lower walks of ecclesiastical service. He became vicar of Stamford in 1607; and in the following year he received the living of North Kilworth, and was made chaplain to Bishop Neile, who became his patron and friend. In 1609, the living of West Tilbury came into his hands, and in 1610 that of Cuckstone, which, on account of his health, he exchanged, in the same year, for the benefice of Norton. In 1611, through the influence of Neile, and in spite of the counter-influence of Abbot, he was elected president of St John's College, and was soon after appointed one of the king's chaplains. After a stay of five years at court, in undisguised disgust at the slowness of his preferment, he was presented with the deanery of Gloucester, where, more than by the faithful memories of court-gossips, his life was embittered by the Calvinism of the bishop. Laud accompanied King James to Scotland in 1617. With considerable reluctance the king raised him to the see of St David's in 1621; and Laud, in consequence, resigned his presidentship. He is thought to have been concerned in the framing of the royal edict of 1622, by which any pastor under a bishop or dean is prohibited from preaching on predestination, and other difficult doctrines mentioned. In the same year took place the famous "Conference with a Jesuit," in which Laud assisted to establish the sinking faith of the Countess of Buckingham; and was rewarded by becoming the confessor of her son the Duke. This is supposed to be the meaning of that passage of his diary, where he writes that he became "C." to the Duke of Buckingham. By the Duke's influence, and at his own earnest request, he became, in 1624, a member of the Court of High Commission, from which he had been excluded by the old enmity of Abbot, Archbishop of Canterbury. The accession of Charles I. increased the influence and brightened the prospects of Laud. It seems, however, that even in taking this step to power, he was not unstained with new guilt, for heavy charges were afterwards brought against him of having corrupted the prayers, and altered the coronation oath. He became the king's confidential adviser in church affairs; he wrote his parliamentary speeches, and (as the old phrase went), he *tuned the pulpits*, when money was wanted for the Spanish war. For his devotion he was appointed, in 1626, Bishop of Bath and Wells, and dean of the Chapel Royal; in 1627, a privy-councillor, and, in 1628, Bishop of London. After the assassination of Buckingham, Laud succeeded to his favour with the king; and as he thenceforward plunged recklessly into political affairs, he inherited a double share of unpopularity with the people. He inaugurated his rise to power by a relentless persecution of the Puritans. Leighton, a physician, was among the first victims. For the publication of *Zion's Plea*, he had his nose

slit, his ears cropt, and his forehead branded, besides being publicly whipped. In 1630 he became Chancellor of Oxford; and, by his donations of valuable manuscripts, proved a liberal benefactor to that university. Three years afterwards, he was present at the king's coronation in Scotland, fostering and planning the vicious policy of Charles in regard to a forced religious uniformity; but, at the same time, by his overbearing insolence, creating much of the enmity that afterwards burst upon his head. Returning home, he was presented in the same year to the see of Canterbury; and one of his first acts as primate was the republication of the *Lawful Sunday Sports*. The very appropriate offer of a cardinal's hat, however, at this time, affords one of the indications of the existence of principles stronger than his ambition;—when the offer was made he hesitated, consulted the king, and at last replied, "That somewhat dwelt within him, which would not suffer that, till Rome were other than it is." During his metropolitan visits in 1634 and 1635, he charged all the churchwardens, on pain of being punished by the Star-chamber and High Commission, to place the communion-table at the east end, instead of the middle of the chancel, and to fence it, like a Popish altar, with rails. In 1634 he became one of the Committee of Trade and the King's Revenue, and soon after a commissioner of the Treasury. The decree of the Star-chamber, in 1637, constituting him, along with others, the censor of the press, brought him into great public odium, which was greatly increased when the Nonconformists, Prynne, Burton, and Bastwick, chiefly at his instigation, were mercilessly fined and mangled. Soon after the meeting of the Long Parliament in 1640, he was accused before the House of Commons of high treason, and was committed to the Tower. After three years of harsh confinement, he was tried before the House of Lords; and although the charge was not proven, he was ultimately condemned by a bill of attainder. He was executed on Tower-hill, January 10, 1645, and met his fate with firmness.

That Laud was cruel and intolerant beyond his times, cannot be denied. His diary, which, however, only discloses one side of his character, yet plainly shows that few who sacrificed everything to ambition have had fewer relents. Only once did he give proof of intellectual power in his boasted argument with the Jesuit, Fisher; but all respect for the acuteness which he then displayed is lost in the contempt which we feel for the idle narrator of stupid dreams and paltry prodigies, such as we find him in the record of his daily life. Unchecked by any deep benevolence, or any strength of reason, the love of church uniformity was his master-passion; and to this idol of the fifth century he did not scruple to sacrifice all that his country then possessed of true piety and freedom.

His principal works are:—*Seven Sermons preached on several occasions*, 1651, 8vo; *Short Annotations upon the Life and Death of the Most August King James; Answer to the Remonstrance made by the House of Commons in 1628*; His *Diary* by Wharton in 1694, with six other pieces, and several letters, especially one to Sir Kenelm Digby on his embracing Popery; The second volume of the *Remains of Archbishop Laud, written by himself*, 1700, folio; *Officium Quotidianum, or a Manual of Private Devotions*, 1650, 8vo; *A Summary of Devotion*, 1667, 12mo. About eighteen Letters of Laud to Gerard John Vossius have been printed by Colomesius in his edition of *Vossii Epistolæ*, London, 1690, folio; some others are published at the end of the *Life of Usher*, by Parr, 1686, folio; and a few more have been inserted by Dr Twells in his *Life of Dr Picoche*, prefixed to the theological works of that author, 1645, 2 vols. folio. His biographies include the works of Prynne (London, 1646), Heylyn (London, 1671), John Parker Lawson (London, 1829), Charles Webb le Bas (London, 1836), and of the Rev. J. Baines (London, 1855.) A complete edition of his works is published in the Library of Anglo-Catholic Theology, 6 vols., Oxford, 1847.

Laud.

Lauder
||
Laura.

LAUDER, SIR THOMAS DICK, Baronet, a popular miscellaneous writer, the only son of Sir Andrew Lauder, was born at Edinburgh in 1784, and succeeded to the baronetcy in 1830. His contributions to Tait's and Blackwood's *Magazines* first brought him into notice. *Lochandhu* and the *Wolf of Badenoch* were written when he was very young. He is the author of a paper on "The Parallel Roads of Glenroy," printed in vol. ix. of the *Transactions of the Royal Society* of Edinburgh, of which he was a member. He also published several sketches of Scottish scenery, under the titles of *Highland Rambles*, *Legendary Tales of the Highlands*, *Tour round the Coasts of Scotland*, and a *Memorial of the Royal Progress in Scotland* in 1842. He was for several years an active and useful secretary of the Board of Scottish Fisheries and of Arts and Manufactures. Sir Thomas died in 1848, at the Grange, near Edinburgh, and was succeeded in his title by his son.

LAUDER, a royal and parliamentary burgh of Scotland, county of Berwick, near the Leader, a tributary of the Tweed, 24 miles S.E. from Edinburgh. The burgh possesses a common of 1700 acres, belonging exclusively to a few privileged burgesses. In the neighbourhood is the mansion of Thirlstane, the seat of the Earl of Lauderdale; and about half a mile from the town stood the old bridge over the Leader, where the favourites of James III. were hanged. Lauder unites with Haddington, Jedburgh, Dunbar, and North Berwick in returning one M.P. Pop. (1851) 1105.

LAUDOHN, GIDEON ERNEST, BARON VON (*Scot.* Loudon), a famous Austrian general of Scottish descent, born at Totzen, in Livonia, in 1716. At a very early age he entered the Russian service, and fought in several battles against the Turks; but obtaining no preferment, he enlisted into the Austrian army, where he was advanced in quick succession to the rank of captain, major, and lieutenant-colonel. In the Seven Years' War, which was begun in 1756 against Frederick the Great, he so signalized himself as to receive within a year the rank of major-general, and within three years he became commander-in-chief. Of these honours he proved himself highly worthy by his victories at Hochkirk in 1758, at Kunnersdorff in 1759, and at Landshut and Glatz in 1760. Peace was proclaimed in 1763; and to the title of Baron, which Laudohn then received, were added, in 1766, the dignity of aulic councillor, and in 1778 the high office of field-marshal of the empire. In the war with the Turks he was again victorious at Dubicza, Novi, and Grandisca. For the capture of Belgrade, in 1789, he was made Knight of the Order of Maria Theresa. Laudohn died of a fever in 1790.

LAUENBURG, DUCHY OF. See DENMARK.

LAUNCESTON (anciently *Dunneheved*), a municipal and parliamentary burgh of England, county of Cornwall, stands on a hill rising from the banks of the Attery, an affluent of the Tamar, 213 miles W.S.W. from London. The parish church is built of curiously carved blocks of granite. Launceston, till recently, was considered the capital of Cornwall, and was the seat of the two county assizes; but these were both removed to Bodmin, the one in 1716, the other in 1838. It returns one M.P. Market-days, Wednesday and Saturday. Launceston was anciently surrounded by a wall, of which there are still some remains. More interesting, however, are the ruins of an old castle, the grounds of which are tastefully laid out as pleasure-grounds. Pop. of parliamentary burgh, 6005; pop. of municipal burgh, 3397.

LAURA was the name given to a collection of separate cells in a wilderness, differing from the monastery, or building in which the monks all lived together. In the laura each monk had his own cell provided for himself, and lived alone during five days of the week, his only food being dates and bread and water. On the remaining two days

the inmates of the lauras took the sacrament, and supped on broth in common. The origin of the name is obscure. The most celebrated lauras mentioned in ecclesiastical history were in Palestine; as the laura of St Euthymus, four or five leagues distant from Jerusalem; the laura of St Saba, near the Brook Kedron; and the laura of the Towers, near the River Jordan.

LAURENCEKIRK, a burgh of barony of Scotland, Kincardineshire, on the Aberdeen Railway, 30 miles S.W. of Aberdeen. It is famous for its manufacture of snuff-boxes, the hinges of which are almost invisible. Beattie the poet was born here, 5th December 1735. Pop. (1851) 1611.

LAURENTUM, an ancient town of Latium, situate between Ostia and Lavinium, about 16 miles from Rome. It derived its name from a grove of laurels with which it was surrounded. Virgil describes it as the residence of King Latinus, and capital of Latium, when Æneas landed on the shores of Italy. With the growth of Lavinium, however, it seems to have fallen into decay; and Ostia, as the port of Rome, seems to have deprived it of its trading importance. Pliny the younger, and Commodus had both villas at Laurentum, although its marshes, whence the Romans derived wild boars for the table, must have rendered it exceedingly unhealthy. The *Ager Laurens* was the general term for the district, the limits of which, with the precise site of the town itself, are now difficult to determine.

LAURIA, a town of Naples, province of Basilicata, situate on the side of a steep hill, 7 miles S.S.E. of Lagonegro. It is divided into an upper and lower town, and has two parish churches, two convents, and several woollen factories. In the vicinity are numerous vineyards. Pop. about 9000.

LAURVIK, a seaport-town of S.E. Norway, in the district of Jarlsberg, situate at the head of a short fiord, into which the Laagen Elv debouches a little to the S.E. of the town. The best Norway iron is manufactured here; a considerable trade is carried on in timber and fish. About half a mile S. of the town, on the W. side of the fiord, is Frederiksværn, a station of the Norwegian fleet, and the seat of a naval academy. Pop. of Laurvik, 3600.

LAUSANNE (Latin *Lausanium*; Italian *Losanna*), a city of Switzerland, the capital of the canton of Vaud, stands on the lower slopes of the Mount Jorat, on the northern shore of the Lake of Geneva. As it is built on three distinct eminences and the intervening gorges, its streets are steep and irregular, and few of its houses are built on the same level. One of the ravines is spanned by a lofty bridge, called the Pont Pichard. The principal edifice is the cathedral, founded in the tenth, and finished in the thirteenth century. For the beauty of its interior, it surpasses all the churches in Switzerland. It is crowned by a lofty tower and a spire 200 feet high, and contains the tombs of Amadeus VIII., Duke of Savoy, and Bernard de Menthon, founder of the Hospice of the Great St Bernard. John Kemble, the famous actor, was also buried here. From the terrace of the cathedral a fine view of the Lake of Geneva and the vicinity is obtained. On a higher platform, behind the cathedral, stands the castle, a massive square building, with turrets at the angles. It was formerly the residence of the bishops of Lausanne, but is now the council-house of the canton. The other public buildings are the church of St Francis, a college, a cantonal museum, containing many curiosities, natural and antiquarian, a theatre, prison, penitentiary, post-office, and normal school. The manufactures of Lausanne are few, comprising only cotton and woollen cloths, leather, paper, and jewellery. There is little trade; and foreigners resort to the city chiefly on account of its cheap education and the beauty of the surrounding scenery. Haller, Tissot, and Voltaire resided here. Here Gibbon wrote the latter half of his *History*, in a house which, under its present

name of the Hotel Gibbon, is one of the notorieties of the city. At Ouchy, the port of Lausanne, Byron composed his "Prisoner of Chillon." Between this port and other towns on the Lake of Geneva, steamboats ply regularly. Pop. 17,108.

LAVAL, a town of France, capital of the department of Mayenne, is situate on the Mayenne, a tributary of the Loire, 187 miles W. by S. of Paris by railway. It stands on a declivity on the W. side of the river, which is here crossed by two bridges, connecting the proper town with a large suburb. The streets of the town are narrow, steep, crooked, and dirty. The houses are almost all built of wood, in the old French style, each storey jutting out beyond the one underneath, thus rendering the streets dark and gloomy. Laval proper is inclosed by old walls, now in a state of decay. The suburb on the opposite side of the river is of recent date, and is laid out on a regular plan, having wide and regular streets. This faubourg forms a third of the entire town, and is the residence of the better class of the inhabitants. The village of Avenières also adjoins the town, and may be considered as another suburb. It contains a fine old church in the Norman style, erected in the year 1040. The principal edifices of Laval belong to the middle ages. An old castle of the twelfth century, now used as a gaol, stands on the right bank of the river, near the old bridge; it was formerly held by the Counts of Laval and Trémouille. The cathedral, the church of St Vénérand, and two hospitals, are nearly of the same age as the castle, and are worthy of attention as curious specimens of Gothic architecture. The linen hall is a large and handsome building of recent date. Ambrose Paré, the father of French surgery, was born here in 1509; and a statue to his memory has been erected in the Place de l'Hotel de Ville. Laval may now be considered as wholly a manufacturing town, its staple articles being linens and ticking, for which it has long been famous. Besides these, however, it also manufactures cotton, flannels, soap, and leather, and possesses a considerable trade in wine, brandy, and marble. The town is the see of a bishop, and contains a tribunal of first instance and a chamber of commerce.

Laval probably owes its origin to a castle built here in the earlier part of the middle ages, to protect the surrounding country from the inroads of the Bretons. This fortress was destroyed by the Northmen in the ninth century, but was afterwards rebuilt and possessed by the Laval family for many years, until it fell into the hands of the English under Lord Talbot in 1466. Next year, however, it was recovered by the French, and the castle returned to its former owners. In more modern times Laval was the scene of a memorable conflict between the Royalists and Republicans. In 1793 the Vendéans, under Larochejacquelin, carried this town at the point of the bayonet, and then marching against the Republicans under Lechelle, routed them at a place called Les Croix de Bataille, a little distance S. of Laval. Pop. (1851) 17,538.

LAVATER, JOHANN CASPAR, the "Fénélon of Germany," as he is very frequently styled by his German admirers, was born in 1741 at Zürich, where his father was a physician. In his youth he was a timid, solitary child, sensitive and thoughtful; but his shrinking nature was often roused to heroism when he was called to stand forth as a champion in domestic troubles, or in exposing wrongs at school. In early youth he dedicated himself to the church, and Goethe has characterized him as one of the few "fortunate men whose outward vocation perfectly harmonizes with the inner one, and whose earliest culture, coinciding in all points with their subsequent pursuits, gives a natural development to their faculties." In 1762 he entered on the duties of the ministry, and in the two following years travelled in Germany along with Fuseli the painter, and studied theology under Spalding; but it may be easily un-

derstood how a mind so observant should learn theology more from instinct in his contact with men than by analytic criticism from books or lectures. In 1764 he returned to preach in his native town, where he was appointed preacher, first of the Orphan House, and afterwards of the Petrus Kirche, and this latter duty he continued to discharge till his death.

It was as a preacher and a poet that he first became known to fame, and it is needless to try to sever the two vocations, as his preaching often soared into poetry, and his poetry seldom rose above the level of his preaching. His *Swiss Songs* and *Hymns*, and his *Peeps into Eternity* (*Aussichten in die Ewigkeit*), were the first of a series of works, in which he was almost as voluminous as Luther, and which may be taken as the types of all his productions, either purely literary, or more strictly religious. With Hamann (the Magus of the North), Claudius, and Jung-Stilling, he was one of a small band who struggled to revive Christianity as a personal faith on a historical and living, in contrast with a mythical and passionless, Saviour. In his pulpit he was listened to by thousands, his correspondence extended to all Europe, and when he went out of doors, the people of Zürich kissed him in the streets. In the poetic field he had greater rivals. Klopstock and Cramer were then in the height of their fame, and his poems were too purely an imitation of the former. Like Klopstock, Lavater wrote a *Messiah* (1780), the Messiah of Martha or common life, as Hamann called it, in opposition to that of Mary or unearthly sublimity. In the lower range of sentiment, Lavater's Sacred Songs have found a securer resting-place in the world. His own spiritual life, however, was too restless and passionate to write long-lived or widely popular hymns; and in sober moments, his songs, whether patriotic or religious, seem far too rhetorical and over-drawn. His *Peeps into Eternity* are peculiarly characteristic, and throw a strange light on the earnestness with which afterwards, as a physiognomist, he gazed on human faces. The leading principle of the book is the dependence of the celestial state on the education and pursuits of this world; and with this he constructs a fantastic but startling anthropology of a celestial kingdom, "in which the day-labourer will be as indispensable as the king." For himself, he writes to the friend to whom he dedicates the book, he had chosen the pursuit of teaching the children to sing songs in heaven. Unlike Swedenborg, however, Lavater put forth his theory as a conjecture, not as the product of celestial vision. This work was followed by the *Pontius Pilatus oder die Bibel in Kleinem* (4 vols., 1782-1785), another picture of the lights and shades of humanity; *Die Handbibliothek für Freunde* (24 vols., 1790); his *Diary*, 1771-1773; and his *Nathanael*, dedicated to Goethe, as a "Nathanael whose hour had not yet come."

Previously to this, however (in 1775-78), there had appeared his *Physiognomic Fragments*, a profusely illustrated book in four quarto volumes, and published at L.15. It was the result of many years' close observation, and has since been issued in almost every form in all the languages of Europe. Its publication created everywhere a profound sensation. Admiration, contempt, resentment, and fear were cherished towards the author. The discoverer of the new science was everywhere flattered or pilloried; and in many places, where the study of human character from the face became an epidemic, the people went masked through the streets. Musæus and Lichtenberg assailed him with ridicule, but their arrows glanced harmless from the broad shield of Goethe. The principle of the study is at once true and false. Lavater's great error consisted in attempting to elevate it to the dignity of science (see Kant's *Anthropology*), but this is easily pardonable, when we remember how securely and felicitously he handled the most obscure facts on which he built his theory. In stating his method he studi-

ously lets it be seen that he founded his conclusions on the total impression of the face; and he is anxious to discriminate his *own* science from the science of Pathognomic, or the outward expression of occasional passions. It cannot be denied that many of his observations show the keenest sagacity, and it is equally true that his delineations are given, not in irony, but in the profoundest love for everything human.

In his declining years, physiognomy itself gave place to even wilder and more objectionable pursuits in the mind of Lavater. From the dreams of his childhood he had believed firmly in the sensible manifestation of supernatural powers, and, still a child in his old age, he gave the most ample credence to the stories of exorcism of devils and miracles by animal magnetism, which were then current all over Europe. Of whatever extravagance he was guilty, and it was greatly exaggerated, his defence is noble, that with his finger on a truth, he was not ashamed to confess where he had learned it, and that it was treason to Christianity itself to reject a true fact merely because it was known and attested by Mesmer, Socinus, Rousseau, Spinoza, or Cagliostro. It is characteristic of the man, and undoubtedly redounds to his credit, that in the religious world he was accused of all heresies, from Atheism to Crypto-Jesuitism, because he dared to acknowledge the truth that was in most, while in the inner intolerance of his own faith he rejected the falsehood that infected all.

His friendship with Goethe is one of the most affecting episodes of literary history. In 1773 they had begun to correspond, and soon after the two friends met at Frankfurt. They travelled together with all the glee of children escaped from school, and in Goethe's autobiography we have an amusing sketch of a journey from Coblenz to Neuwied with Lavater and Basedow:—

“Prophete rechts; prophete links;
Das Weltkind in der Mittel.”

“He is the best, greatest, wisest, sincerest (*innigst*) of all mortal and immortal men that I know,” wrote Goethe soon afterwards. “He is the flower of humanity, the best of the best,” he wrote again, after having visited Lavater in Zürich. Their friendship continued till the publication of *Pontius Pilate*, when Goethe recoiled from the picture which his friend had drawn of the no-Christian, as he confessed himself to be. From that hour the poet's affection was changed into Julian hatred, never to be appeased. In the summer of 1797 Goethe was in Zürich, and walked often in the Peterplatz before Lavater's door. They did not, however, meet. Lavater visited the hotel, and, as a pledge of friendship, wrote his name upon the room door, but this appeal to their former intimacy was in vain.

With all the Swiss love of freedom, Lavater hailed the French Revolution. After the death of the king, however, his admiration was changed into horror, and in the pulpit

he declaimed against the French party with a zeal which cost him a quick and summary banishment. Surrounded with bayonets and dragoons, he quietly allowed himself to be hurried off, saying, with a smile, that “he had never travelled with such pomp before.” The popular indignation however, took fire at the outrage, and he was soon after permitted to return. On the 26th September 1799, Massena took Zürich, and Lavater received his death-wound on the streets while protecting a poor woman from assault, and ministering bread and wine to the soldiers. The grenadier who shot him was, according to Jung-Stilling, a Swiss, who knew the fatal power with which Lavater had denounced the tyranny of revolution. Lavater is said to have recognized the man, but in his verses of forgiveness he did not divulge his name. He died 2d January 1801.

A good selection of his voluminous works has been edited by Orelli. His Life has been written by Gessner, and more recently by F. W. Bodemann, Gotha, 1856.

LAVAUUR, a town of France, capital of a cognominal arrondissement in the department of Tarn, stands on the left bank of the Agout, here crossed by a handsome bridge, 25 miles S.W. of Alby. In the thirteenth century it was a stronghold of the Albigenses, but was taken in 1211, after a vigorous resistance, by Simon de Montfort, who massacred the inhabitants without distinction of age or sex. Lavaur has a communal college, public library, and 7113 inhabitants, chiefly employed in the manufacture of silk serge, hosiery, cotton yarn, and leather. It is the entrepôt for the silks of Upper Languedoc.

LAVENDER. See BOTANY, *Nat. Ord.*, 163; and PERFUMERY.

LAVENHAM, or LANHAM, a market-town of England, county of Suffolk, on a branch of the Bret, 16 miles W.N.W. of Ipswich, and 62 miles from London. It consists of several streets, with a spacious market-place, having a stone cross in the centre. The parish church is a handsome edifice, with a spire 142 feet high, and having the timber ceiling and several of the pews richly carved. Lavenham was formerly noted for its manufacture of woollen cloth, which subsequently gave way to that of hempen goods, but now its manufactures are unimportant. Market-day, Tuesday. Pop. of parish (1851) 1811.
